No. 4

THE PROGRESS OF THE WORLD.

*English Versus
American
Politics.*

Our private advices from England, to which allusion was made in these pages last month, proved to be correct; and Mr. Gladstone's retirement from the post of prime minister was consummated early in March. The course of English politics has been keenly interesting every day for

many weeks. Most of the current news from Washington, with Congress in the middle of the most critical session of recent years, has been too dull to read without effort; while the English news has been, even to us in America, the most eagerly scanned of all that has appeared in the newspapers from day to day. Every scrap of fresh information about Mr. Gladstone has been sympathetically welcomed. There has been an unabated desire to know everything that could be learned about the new Premier, Lord Rosebery. Even Sir William Harcourt has at length won the curious and fixed attention of American readers. Anything about Mr. Secretary Asquith and his engagement to Miss Margot Tennant is far more sure to attract the quick notice of newspaper readers in this country than anything that could just now be said about our own Secretary of the Interior, Mr. Hoke Smith. Readers on our side of the Atlantic are following the sensational parliamentary career of Mr. Henry Labouchere with much greater zest and appetite than they are watching, for example, the remarkable strategies that Mr. David B. Hill is pursuing at Washington. A great discussion has been raging in this country regarding the relations of the Senate toward the Executive and toward the other House of Congress. Yet unquestionably the contest that begins to fill the air in England regarding the House of Lords and its obstruction of legislation has a dramatic interest even for Americans that the Washington situation does not possess.

*Why the English
Game is More
Exciting.*

Why is it that the great game of politics in England is so much easier to follow and so much more thrilling in its daily incidents than the great game of politics in

America? The question has been often asked, and not always intelligently answered. One reason is the full centralization of British political life. Just now we have been witnessing rather lively times politically within the domain of the State of New York, where a legislature is in session, and many questions are before

UNARMING.—From *Punch* (London).

"Unarm!—The long day's task is done!"
(*Antony and Cleopatra*, Act IV, Scene 12.)

the people. These local issues have engrossed more attention than affairs at Washington. There is much talk about nominations for Governor. A Constitutional convention is soon to assemble. And in many other States, as in Iowa, Colorado, California, New Jersey and Ohio, home political questions and home political personages have filled the public mind to the obscuring of events and men at Washington. Even

when we endeavor to fix our attention upon the course of affairs at the Federal capitol, we find it necessary to change the focus continually. The boy who wants to miss nothing that is done at the circus where simultaneous performances are going on in three rings, finds his eye and brain subjected to a severe and anxious responsibility. And the observer who wishes to miss nothing of the political performance at Washington,—when one House is engaged with a tariff or

MR. H. H. ASQUITH.

coinage bill, when the other is wrestling with a Supreme Court nomination or an anti-option bill, and when the Administration is busy on its own independent account with the issue of a national loan or an attempt to enthrone a Queen,—is facing a well-nigh baffling task. Moreover, the most interesting things go on behind the scenes. The Cabinet never comes before Congress for public cross-examination, and Congress itself does its real work by means of committees rather than by process of open debate. There are really a dozen rings in the Washington political circus, into most of which the spectator is allowed only an occasional unsatisfactory peep. But in England there is absolute unity in the performance. For all practical purposes the Cabinet and Prime Minister,—*i. e.*, the Executive Government,—are a Committee of the House of Commons. Everything is fought out in that one arena. Occasionally, as now, it happens that the Prime Minister is in the House of Lords; and it is always true that several members of the Ministry are Lords. None the less it is a fact that the Government stands or falls with the support or rejection of a majority of the House of Commons, and that the whole political game is played in that one spot. The House of Lords possesses no interest so far as its proceedings are concerned. That is to say, no one ordinarily attaches any importance to its debates or opinions. It is of consequence merely because it may stand in the way now and then as an obstruction. The interesting question that then arises is, What will the House of

Commons do about it? The game may be hindered and its outcome seriously affected by such an outside influence as the House of Lords. But the fact is not altered that the whole game remains in the hands of the Commons and there are really no other participants.

*Permanence
of the
Players.*

Another thing is to be noted. The leading players in the game of British politics do not change very rapidly or frequently, and we come to know them and follow their fortunes with all the warmth of interest that attaches to old friends or old enemies. We cannot keep up with French politics because every Ministerial upheaval lands a fortuitous group of new men on top of the situation. But we do not have to ask who Salisbury, Balfour, the Duke of Devonshire, Randolph Churchill, Joseph Chamberlain and George J. Goschen are, nor is it difficult to keep track of a party that entrusts its leadership to Gladstone, Rosebery, Harcourt, Morley, Kimberly, James Bryce, Fowler, Asquith, Trevelyan, and their associates. Labouchere is always on hand; Justin McCarthy, John Dillon, Michael Davitt, Tim Healy, Dr. Tanner and other Irish patriots maintain their positions and attitudes. John Redmond, the Harringtons, and their little faction, are clearly located in our minds. We are puzzled somewhat by the shifting groups and factions of so comparatively stable a body as the German Reichstag. But in the English political game we know the men.

MISS MARGOT TENNANT.

can estimate their forces, can comprehend the moves, and in short can witness the entertainment with a comfortable and flattering sense of fairly clear comprehension. Now, to be perfectly frank, most of us are not always sure of knowing the men at Washington. A strong man does not drop out of English politics. Mr. McKinley, Mr. Harrison, Mr. Ingalls, Mr. Tracy, Mr. Morton, Mr. Hiscock, Mr. Warner Miller and other prominent Republicans are no longer participants in the game at Washington. Such an exclusion is unknown in England. A seat in the House of Commons can always be found for a prominent member of either leading party. The fighting leaders of the two parties always confront each other. The Ministers of the party in power sit on the front bench of the Governmental side; and the ex-Ministers of the party out of power sit on the front Opposition bench. New men are worked in gradually, but not spasmodically. With us, the change of men is very rapid. Mr. Cleveland's present Cabinet was for the most part composed of men who had never participated at all,—or never with great prominence,—in the political game at Washington. Mr. Carlisle's case was the exception that proved the rule. The House of Representatives, moreover, is full of new men. Even Mr. Wilson himself is a comparatively recent figure in our public life, and yet he is an old stager when compared with many others who are taking most active and prominent parts in our governmental business at Washington.

Neither System Can Claim Superiority. All of this proves nothing as to the superiority of the one system or the other. The consensus of recent European opinion is inclining towards a preference for the American plan of a separation of the executive power from the law-making body. But nobody can deny that the English system is the more entertaining for the onlooker. If the Senate and House were consolidated into one chamber, and if the Presidential cabinet occupied seats on the floor and were engaged in constant discussion of their own acts and policies and of pending legislation as it related to their various departments, we should see a more exciting political game at Washington; and personality in politics would count for much more than it now does. If, in addition, our laws and customs did not compel a public man to abide by the verdict of the State or district in which he lives, but made it readily possible for him to represent the people of some other State or district, we should not lose out of our public life at the very moment of their highest usefulness such men as Thurman of Ohio, Harlan of Iowa, and plenty of others who could be named. Our system is far more truly representative of the people than the English system, which is essentially aristocratic. And such as it is, our system is with us to remain in all its most characteristic outlines. But it does not furnish us with half as zestful sport as the English system of government by a committee of the dominant party or coalition in the House of Commons.

Obstructing the Seigniorage Bill.

Without any change in the distinctive features of our legislative system, it would be possible, at least, to eliminate some very objectionable practices. The one important measure which has made its way through both houses of Congress since our record closed last month, is Mr. Bland's bill for the coining of the seigniorage,—the purport of which was explained in our March number. The means by which the enemies of this bill retarded its progress in the House deserve emphatic condemnation; and the means by which its friends accelerated its passage through the Senate are not less sharply censurable. For two weeks Mr. Bland and Speaker Crisp were occupied with strenuous attempts to secure a quorum in order to act upon Mr. Bland's motion to fix a date for the final vote. Members absented themselves upon all sorts of trumped-up excuses, and warrants were issued for the arrest in various States of truants who had gone to their homes on divers pretexts. But more provoking even than the recreancy of members who left Washington and scattered themselves in all directions was the conduct of those who remained and who actually occupied their seats, yet by refusal to participate when Mr. Bland's motion was put prevented the securing of a quorum under the rules of the House. It will be remembered that under the last Republican control of the House of Representatives Speaker Reed met and vanquished obstructive filibustering of this particular character by the straightforward device of counting, for purposes of a quorum, every member actually in the room, whether that member admitted his presence by responding to the roll call or not. Mr. Reed simply cut the Gordian knot.

Down with Filibustering!

With due regard for the rights of minorities and the reasonable duration of debate, the majority has a right to legislate; and it has an undoubted right to use masterful methods to break up obstruction through the abominable tactics of "no quorum." Mr. Bland was perhaps too harsh and choleric in the language used by him in the denunciation of this practice, but he was not far from right when he pronounced it essentially anarchistic. Lawmakers who desert their posts in order to prevent the passage of laws they do not like, conspire to effect the total annihilation for the time being of the law-making body. This is a matter to which constituents should look with care. Members who have played these tricks should be asked to renounce them before they are sent back to Congress for another term. The Democrats had made such a record of passionate protest against Speaker Reed's rulings and methods that when they came into authority themselves they were ashamed to make use of his excellent reforms. Their return to obsolete parliamentary methods that make filibustering comparatively easy, now affords the Republican members under Ex-Speaker Reed's leadership a very colorable pretext for retaliation. Nevertheless, we must pro-

test that it is not a high impulse of patriotism that these Republicans are obeying in resorting to parliamentary obstruction; and they deserve the censure of their constituents and of the country. The Republicans, however, were by no means alone in filibustering against the seigniorage bill. The lead was taken by Eastern Democrats. The Democratic majority in Congress is so enormous that, unless the prevailing party is divided against itself, Republican obstruction amounts to nothing whatever. Mr. Bland had a heavy task in whipping in the skulkers; but a quorum was at length procured, and the bill was passed by a vote of 168 to 129 on Thursday, March 1.

On the following Wednesday, March 7, the seigniorage bill was brought up in the Senate. In the ordinary course of things it would have been referred to the Finance Committee, but a motion to this effect was defeated and the bill was hurried through the successive stages required by the rules until it had passed its third reading, was beyond the condition where amendments could be proposed or entertained, and was on the point of submission to final vote. All these processes,—which had required a full month in the other House, and which, in the reasonable nature of the case, should have required at least two or three weeks in the Senate,—were gone through with in about as small a fraction of time as is taken with the writing of these sentences. The result was accomplished, to use plain language, by parliamentary trickery. The opponents of the bill, it is true, ought not to have been caught napping; nevertheless they were designedly thrown under a misapprehension, and were not frankly and openly dealt with. Such performances are not in line with the dignified traditions of the United States Senate. They would be disgraceful in the pettiest parliamentary body that ever existed, and would not be countenanced in a college debating society, where smart parliamentary practice is considered permissible as a matter of training and discipline for after life. Mr. Allison of Iowa moved to reconsider the vote ordering the bill to its third reading and the subject went over to the following Wednesday, when the motion to reconsider was defeated by a vote of twenty-eight to forty-five. On the following day, March 15, the bill was put to its final vote and passed by forty-four yeas and thirty-one nays. The thirty-one adverse votes were given by nine Democrats and twenty-two Republicans. The forty-four votes for the bill were given by thirty Democrats, ten Republicans, and four Populists, counting Senator Stewart as a Populist rather than a Republican. Great interest at once centred about the question whether or not President Cleveland would sign the bill. It was the staunch opinion of those who have been most in accord with President Cleveland's general financial policy that he would unhesitatingly veto this measure. Others asserted that while undoubtedly Mr. Cleveland would not have any pleasurable emotions in allowing the bill to become a law, he would de-

cline to veto it lest such action on his part should provoke a train of very serious consequences. It was claimed that the friends of silver would retaliate against the presidential veto of the seigniorage bill by refusing to pass the Wilson tariff bill in any form through the Senate, and by further bringing in and forcing to a passage through both houses a bill for free silver coinage. The Senate adjourned after passing the seigniorage bill until Monday, March 19, and the measure was not signed by the presiding officers of the two houses and sent to the White House until that date. The strong probabilities seemed to be on the side of those who contended that the President would refuse to affix his signature.

The Outlook for Bimetallism. From no point of view has the seigniorage bill seemed to us to be a desirable measure. From the standpoint of those who wish to see silver restored to an important place as a money metal, it ought to be clear that the Bland seigniorage bill is a mere looking backward toward a line of policy that was defeated and abandoned with the passage of the act repealing the Sherman purchase system. A forward movement on new ground is what the bimetallists should favor. An important commission has been sitting in Germany to inquire into the advisability of a larger use of silver in the currency of the German Empire. The deranged condition of the currency in India, and the commercial losses entailed thereby, are leading to a renewed study of all phases of the silver question by British economists and statesmen. The probability of the reassembling of the International Monetary Conference begins to increase, and the times are becoming considerably more auspicious for the active treatment of monetary and coinage questions as international rather than national problems. The best thing for silver men to do, therefore, would be to abandon for the present their futile attempts to rehabilitate the standard silver dollar in this country, and to join forces with those statesmen and economists of all countries who believe in and demand an international solution for the silver question.

The Wilson Bill in the Senate. The seigniorage bill, however, has been a mere episode of the month in the history of the United States Senate. Real interest has centred in the Senate's treatment of the Wilson bill for revision of the tariff and internal revenue and the establishment of an income tax. It is true that the work upon this measure has been in the Finance Committee room rather than upon the Senate floor. But the public attention has been occupied as fully with the protracted battle in committee as if the contest had been taking place in the full Senate. The Democratic majority in the Senate is not overwhelming as in the House; and there are enough Democratic senators who do not like the Wilson bill for one reason or for another to make very important amendments necessary to insure its passage. The most determined fight was

against the treatment accorded by the Wilson bill to sugar. The McKinley tariff puts sugar on the free list, making it, however, a basis for reciprocity treaties with sugar-producing regions; and in lieu of tariff protection it gives a direct bounty to the American sugar producers, most of whom are in Louisiana. The Wilson bill proposed to abolish the bounty, while doing away with the reciprocity treaties and making sugar imports absolutely free.

*Louisiana
Versus
Free Sugar.*

The Louisiana planters, who have prospered greatly under the McKinley arrangements, would undoubtedly have preferred no changes of any kind in existing laws; but they are of course compelled to admit that the bounty system is not in accordance with Democratic doctrines, and

From photograph by Bell, Washington.

ASSOCIATE JUSTICE EDWARD D. WHITE.

that a tariff on sugar, ostensibly for revenue but which would also operate to protect American producers, would be the best arrangement they could ask a Democratic congress to accept. For this end the Louisiana senators, Messrs. Cafferty and White, stood out most resolutely and with eventual success. Mr. White had been nominated and confirmed for the vacancy on the Supreme bench, but instead of putting on the ermine immediately, he remained in his place in the Senate until the sugar victory had been won in the Finance Committee. His place as Senator

From photograph by Bell, Washington.

SENATOR J. NEWTON BLANCHARD.

has been filled by the appointment of Mr. J. Newton Blanchard, who has for some years been a member of the House of Representatives, and whose position on the sugar question is as firmly that of his Louisiana constituents as was Mr. White's. The new Justice, by the way, was severely criticised in some quarters for remaining several weeks in the senatorial arena after having been confirmed as a member of the Supreme Court, the state of judicial business meanwhile urgently requiring a full bench. Mr. White at one time was a member of the Supreme Court of the State of Louisiana, and is regarded as an accomplished lawyer, being well versed in all that pertains to the theory and practice of law under the Code of his State, which is an adaptation of the French Code, and which is derived from the Roman law rather than from the common law of England which lies at the basis of the law practice and judicial decisions of all our States except Louisiana. It is said that the business of the Supreme Court will be facilitated by the acquisition of a judge who is also familiar with the French and Roman systems of law.

*Stiffening the
Wilson Bill in
the Senate.*

But to continue with the tariff contest in the Senate,—Democratic senators from Maryland, West Virginia, and New Jersey made themselves champions of a duty upon coal and iron ore, these materials having been put upon the free list in Mr. Wilson's bill as it came from the House. The lumber interests also prevailed in their

attempt to restore a part of the McKinley duty that the House Wilson bill had abolished. Wool was left upon the free list by the Senate committee. In very many items the committee increased the duties which had been fixed by Mr. Wilson and his colleagues of the House, while in a few particulars the duties were made still lower. The tax on distilled liquors under the McKinley bill is ninety cents a gallon. The Wilson bill increased it to one dollar, and the Senate committee's revision made it one dollar and ten cents. From the revenue standpoint, the great difference between the House bill and the bill as revised by the Senate committee is the proposed imposition of a tax of about one cent a pound upon all raw sugars, and a somewhat greater duty upon refined sugars for the protection of the American refining trust. It is estimated that this sugar tax will add forty million dollars a year to the national revenues. The Wilson bill as passed by the House was expected so materially to reduce the revenue from imports as to make the income tax necessary for the sake of meeting the government's expenses. The Senate committee did not venture to reject the income tax, but its great increase of the revenue-producing capacity of the bill by the placing of duties upon sugar, coal, iron ore and lumber, could but add very much to the strength of the position of those senators who were prepared to make a determined fight on the floor against the adoption of an income tax in any form. The most outspoken leader in the opposition to the income tax on the Democratic side of the Senate is Mr. Hill of New York. The Republican senators are nearly or quite unanimous against the income tax, and it remains yet to be seen how many Democrats will join Mr. Hill in the attempt to cut away this part of the proposed new revenue system. The long delay and close contest over the sugar schedule in the Senate committee was accompanied by rapid fluctuations in the market price of the stock of the American sugar trust, and wild speculation prevailed in Wall street for several days. Much excitement was created by the charge that senators were using their knowledge of the situation at Washington to participate in the gambling on Wall street. Senator Pepper of Kansas offered a resolution demanding investigation into the sugar speculations of his colleagues, and this motion was only defeated by a narrow majority. A number of senators arose to make personal explanations and excuses. The incident was a humiliating one; and while nothing very scandalous was brought clearly to light, the good name of the Senate did not emerge with any enhanced lustre.

*The Senate
Report on
Hawaii.*

Another important incident in the senatorial month which we are reviewing was the report of the Foreign Relations Committee of the Senate upon the Hawaiian question. Under the chairmanship of Senator Morgan the committee had been conducting a long and very thorough investigation into all the circumstances of our diplomatic connection with Hawaiian affairs since the outbreak of the revolution of January, 1893. The report

consists of a volume of some eight hundred printed pages, the testimony being included in full. Senator Morgan himself drew up the principal document, which in its essential findings is decidedly opposed to the conclusions that Mr. Blount had reached in his famous report to the President. Mr. Morgan fully exonerates Minister Stevens from all blame as to the origin of the Hawaiian revolution, and finds that he was guilty of no misconduct, although disapproving of his proclamation of a protectorate. This action of Mr. Stevens was, however, immediately disavowed

SENATOR MORGAN, OF ALABAMA.

by President Harrison and Secretary Foster, and has not been in controversy at any time since. Senator Morgan takes the ground that President Cleveland committed no impropriety in appointing Mr. Blount, and finds that it was never the intention of President Cleveland to follow up with force his demand that the provisional government should abdicate in favor of Lilioukalani. The four Republican members of the Foreign Committee, Senators Sherman, Frye, Dolph, and Davis, concurred with the Democratic chairman, Senator Morgan, as to the "essential findings" of the Morgan report, but took occasion to file a supplementary report denying the constitutionality of Mr. Blount's appointment and of the placing of the United States naval forces at Honolulu under his orders or under those of Mr. Willis. They also find that the conduct of Messrs. Blount and Willis

in holding communication with the deposed queen was unwarranted and unlawful, and that President Cleveland was wholly unauthorized in his attempted reopening of the question as to the validity of a government which the United States had duly recognized and with which the country was in friendly diplomatic relations. Four Democratic members of the Committee, namely, Senators Butler, Turpie, Daniel, and Gray, dissented wholly from Senator Morgan's report and submitted a minority report which censures Minister Stevens and practically approves from beginning to end every step taken by Mr. Cleveland, Mr. Gresham, Mr. Blount, and Mr. Willis.

Annexation Favored. Far more significant, however, than the mere party loyalty shown in this minority report is the statement which Messrs. Butler and Turpie take pains to add to their general review of the case, in which they avow their belief in the annexation of Hawaii to this country. The position of Senator Morgan and of the four Republican members of the committee as to annexation has already been perfectly well known. It therefore appears that seven out of nine members of the Senate Committee on Foreign Relations have put themselves upon formal record as favorable to annexation as soon as it can be brought about in a manner that would be considered suitable; while it is not clear that the other two members would not also under changed circumstances be in favor of the same course. Now that the attempt of the administration to break down the Provisional Government has been definitely abandoned, the whole episode may as well be dropped from current controversy and left for the calm verdict of the future historian. While we cannot approve of the policy pursued for so many months by Mr. Cleveland's administration, we are glad to avow our belief in the President's absolute sincerity from beginning to end. The relations between Minister Willis and the Provisional Government have for some time been of a growingly friendly character. The report of the Senate committee was received with much rejoicing by the annexationists in Hawaii and with corresponding disgust and wrath by the royalists and by the clique who would like to turn the Sandwich Islands over to the British Empire. President Dole and his colleagues have been engaged in the preparation of a constitution providing for the establishment of a Hawaiian republic. It is probable that the document will be submitted to a constitutional convention for its discussion, amendment and adoption within a very few weeks. There has been much rumor of royalist plots and of an impending uprising against the Provisional Government, but the most reliable advices are to the effect that the existing authorities are in a condition to maintain themselves against their enemies. It is reported that the constitutional convention will be composed of the present members of the governmental councils, eighteen in number, and of eighteen other persons, who will be elected by voters who have held the suffrage under arrangements heretofore existing.

*Reciprocity
Treaties
Threatened.*

One of the clauses of the Wilson bill directs the President of the United States to give notice to the government of Hawaii that the United States intends to terminate the reciprocity arrangements established under the treaty of 1875. Free trade between this country and the Sandwich Islands has been of decided advantage to both parties to the compact, for nearly twenty years. The breaking off of the arrangement at this time would have all the appearance of sheer malignancy and unfriendliness. The clause ought not to be passed. Upon the strength of this reciprocity treaty great American interests have been built up in the Hawaiian Islands, and it would not seem equitable thus to sacrifice them without any clear reason other than a desire to punish Hawaii and its American residents for having had the temerity to desire still closer arrangements between the two countries. As to the new reciprocity treaties established in conformity with Mr. Blaine's policy as Secretary of State, and under the reciprocity clauses of the McKinley Act, there has been a lively discussion in Washington and in the newspapers of the country over their fate in case the Wilson tariff should become enacted into a law. The prevailing, and seemingly the correct, opinion is, that the treaties would fall to the ground without any diplomatic notice of an intention to terminate them, when the new tariff bill came into effect. The value of these treaties to our trade with the West Indies and South America is a question upon which there is the widest diversity of opinion. It seems to us unfortunate that the United States should appear in the eyes of the whole world so capricious, after having entered upon a commercial policy involving treaties with a number of foreign countries, as to smash that policy ruthlessly before it has had a fair opportunity to demonstrate either its success or its failure. Such arbitrary reversals of policy are not statesmanlike.

*The
Pending
Tariff Policy.*

The Democratic party came into power with so clear a mandate from the people that it is abundantly authorized to make very radical changes in the whole revenue system of the United States. But it certainly had no mandate to cut, slash, tinker and deform for the mere sake of being able to claim that it had at last done something about the tariff. The Wilson bill as it left the House was a high protectionist measure in every principle. The added work of the Senate committee has not made it in any point of principle a more thoroughly protective bill than Mr. Wilson himself made it, but has added to it much more of the character of a log-rolling measure, altered not to conform with any principle, but simply to favor certain special interests that were strong enough to insist upon having themselves protected. The result has been thus far to confuse and disturb the course of trade and industry. If the bill should become a law in one form or another, it would have effected nothing of broad and fundamental importance. It would simply have given us the prospect of a cessation of further actual

changes so long as Mr. Cleveland remains in the White House,—that is, for a few months after the presidential election of 1896. If on the other hand the Democrats had shown something of the courage of their Chicago platform, had thrown discriminating and protective tariffs to the winds, and had adopted a simple, uniform tariff for the sole purpose of producing a revenue,—fixing a future date for its taking effect, so that manufacturers and all others should have time to make their plans accordingly,—the situation would be totally different. Even many Republicans who prefer McKinley protection to its pending Democratic caricature, would gladly support a plan for the total abandonment of discriminating tariffs and the adoption of a lucid and simple revenue system.

*The Late
Aggressive
Policy.*

There is this to be said for the programme of the Republican Congress which enacted the McKinley bill: It was a bold, well-conceived and many-sided policy for the rapid aggrandizement of the United States in its commercial and its political interests. It was intended to make complete in the present decade the unrivaled supremacy of the United States as a manufacturing country. It was expected to round out our iron and steel industry by the transfer from Great Britain of that special branch known as the tin-plate manufacture. The addition to our textile manufactures of a great and productive linen industry was part of the programme. It was carefully designed through the bounty system to add sugar to the list of our great crops, partly through the further encouragement of cane growing in the South, but chiefly through the development of the beet sugar industry and the sorghum cane industry in the West. Its reciprocity policy was intended to give our manufacturers a special opportunity to push their wares in the Latin-American countries lying south of us, inasmuch as we were already the principal purchasers of their great exports of sugar, coffee, hides, dye-stuffs, and so on. This same policy looked toward the rapid revival of the American merchant marine through postal subsidies, and believed that reciprocity would lead to a direct traffic between our ports and those of South America,—a traffic that would tend to seek American bottoms. It was a policy which, if the Republicans of the Harrison-Blaine school had remained in power, would have led inevitably to the construction of the Nicaragua canal under exclusive American auspices, would have annexed the Hawaiian islands and developed a great coal and supply station in Pearl Harbor, would have persisted until successful in negotiations for one or more coaling stations in the West Indies, and would in short have pushed at every point the doctrine and principle of our national hegemony in all Western Hemisphere affairs. Such a policy would have led by logical necessity to an early attempt to secure commercial and political union between the United States and Canada. Whether or not an intelligent

American citizen sympathizes with the main principles of this large aggressive public policy, is almost entirely a matter of temperament. Senator Morgan of Alabama happens to be a Democrat by virtue of the geographical argument; but it has long been easy to see that he belongs instinctively to what we may call the American imperial school. There are other Democrats in public life besides Mr. Morgan who belong temperamentally to that same way of thinking. On the other hand there are not a few Republicans who remain in their party through ties of tradition or the convenient logic of locality, who are as devoid of the broad, imaginative, imperial ambition for America, as President Cleveland himself. They have no sympathy whatsoever with the idea of an expansion of our commercial power, or of our influence whether in one half or in both halves of this planet, through aggressive public action.

*The
Democratic
Position.*

It is the misfortune of the Democratic party at the present time not to know just where it stands with reference to a large and expansive American policy. The fact that England, as a small and highly developed manufacturing country, does not find it advantageous to build a tariff wall around herself, has blinded many Americans to the fact that Great Britain, far from pursuing a *laissez faire* course toward British trade and the expansion of British interests, is constantly engaged in promoting, with the whole force of its governmental agencies, the increase of British commerce and influence in all parts of the world. It would be well if our American statesmen of both parties, but particularly those of the Democracy, would devote some study to the larger questions of national policy, in order to find out what they believe and to decide where they will stand. The imaginative and aggressive policy which filled the mind of Mr. Blaine in his last years is a fascinating one—fraught with dangers, but magnificent upon the whole and not too chimerical for practical purposes if deliberately entered upon by the nation. On the other hand, the opposite policy is a safe and honorable one, and has much to commend it. It is a policy which rests upon the principle that it is the business of our government to maintain justice, to do with efficiency those things clearly committed to it as its duties and functions, and for the rest to leave the States to their own devices and private business to its own development in its own way under the great natural laws that affect supply and demand. At present neither one of these two broadly different views of what should be our American national policy for the next quarter century is the exclusive policy of either party, but it is evident that Republican opinion inclines predominantly to the one view, and that the Democratic opinion inclines toward the other, though with misgivings and uncertainty. The Harrison-Blaine-McKinley policy had the imperial and aggressive quality beyond all question. Mr. Wilson, in his position as chairman of the Chicago convention and in the main tenor of his subsequent addresses, has

stood with President Cleveland, Mr. Waterson, Mr. Springer and Mr. Mills upon the principles of the opposite policy. But the Wilson bill, as amended by the Finance Committee of the Senate, represents neither the one policy nor the other, and is without any characteristic quality or guiding or controlling principle of its own. Nobody can at present predict a date when the measure will reach a final vote in the Senate. Still less can it be conjectured when the important Senate amendments will have run the gauntlet of the conference committees of the two houses; when the report agreed upon by the conference can be adopted at the two ends of the Capitol building; or finally when the finished product can be put into the hands of the President for his signature. All this may come to pass in a month, but so speedy an outcome is hardly to be expected.

*The Brazilian
Republic
Triumphs.*

The war in Brazil has ended with the complete subjugation of the insurgents. The rank and file of the insurgent soldiers and sailors were accorded full amnesty. The leaders were not included in the general forgiveness. At last accounts Admiral Mello was in hiding, and Admiral Da Gama, who had been the real leader of the insurgents for some time, had taken refuge with his officers on board a Portuguese man-of-war. A presidential election had been held on March 1st, and a distinguished civilian, Mr. Prudente de Moraes, was elected president by a large majority. This gentleman is said to command to an unequalled extent the respect and confidence of the Brazilian people. He has for some time filled the post of president of the senate. He is a man of learning, high personal character and experienced statesmanship, and his election, followed by the speedy capitulation of the insurgent fleet, ends the early chapters of the attempt to establish a republic in Brazil. From this time forth we shall hear nothing more of plots and revolutions having as their object the restoration of monarchical institutions in the greatest and richest of the South American countries. Our fuller appreciation of the late Brazilian troubles makes apparent some interesting facts. For example, it now seems clear that it was only through the representations and active exertions of the United States government that the European powers were prevented from recognizing the insurgents as possessed of belligerent rights. While European governments did not openly recognize the alleged civil government which the insurgents had set up as a basis for their claim to an international standing, it is none the less true that these European powers, Great Britain in particular, manifested a remarkable degree of leniency toward the insolent behavior of the insurgent fleet in the harbor of Rio Janeiro. The British warships absolutely refused to lend any protection to British merchant vessels, and Admiral Benham of the American navy was compelled to assert, for the ships of other nations as well as for our own, the right to carry on without molestation their peaceful commercial activities in the docks and at the wharves. The

cause of the insurgents declined rapidly and inevitably from the moment that it came to be understood that they were receiving pay from the representatives of Brazilian ex-royalty in Europe, and that Da Gama's ultimate object was the restoration of the monarchy. It would seem that Great Britain was in some covert sympathy with this object, as were other European powers, and that the whole affair at bottom was a contest between Western Hemisphere autonomy and republicanism, and the European proclivity for monarchical institutions *plus* the European reluctance to miss any opportunity for interference in cis-Atlantic affairs. On this hypothesis Americans can perhaps view with less poignant regret the fact that Mr. Charles R. Flint's fleet, fitted out at New York under orders from President Peixoto, was so influential in bringing the insurrection to its end. It is true that the dynamite gun of the *Nietheroy* found no opportunity to try its power for destruc-

PRUDENTE DE MORAES.

tion upon the insurgent men-of-war. But this was solely because the rebel fleet struck its colors when the *Nietheroy* and its companion vessels appeared at the entrance to Rio Harbor. The republic of Brazil has certainly gone through distracting and costly experiences. But this civil war has not compared, in the degree of devastation it has wrought, with Bahnaceda's war in Chili or with several other South American conflicts of recent years. Let us hope for stable, tranquil and sound republican government in the great Brazilian commonwealth, and for the maintenance of close and cordial relations between that republic and our own. At this juncture it is hardly to be wondered at that there should be Americans who would wish to see the reciprocity treaty with Brazil continued and made yet more inclusive in its scope, and would also like to see a great increase of direct steamship communication between New York and Rio Janeiro under the auspices of the two governments.

The Bluefields Incident.

The failure of the Brazilian insurgents, in spite of European encouragement, has not done away with the demand for Admiral Benham's services in protection of American interests. That gallant officer has been ordered to Bluefields, on the coast of Nicaragua, in order at once to protect American trade endangered by local disturbances and to represent if necessary the American doctrine that European interference in Central American affairs will not be welcomed by the United States government. A portion of Nicaragua known as the Mosquito Coast is occupied by a tribe of Indians exercising self-government in some such anomalous fashion as the Cherokees, for instance, in our Indian Territory. There is a large fruit trade from that coast, chiefly in the hands of citizens of the United States. The seaport is Bluefields, and it lies not very far distant from the Caribbean entrance to the Nicaragua canal. For several months Nicaragua and Honduras have been engaged in one of those Central American wars which are of such frequent occurrence and such slight consequence to the world at large that they usually attract little outside attention. The trade of the Mosquito Coast has suggested a source of revenue that the government of Nicaragua has often contemplated with envious eyes. Some weeks ago Nicaraguan troops marched to the Mosquito Coast and took possession, ostensibly to meet a Hondurean force, but more probably with the intention of bringing the reservation under the full jurisdiction for revenue purposes of the central Nicaraguan government. It was under these circumstances that the United States corvette *Kearsarge* was ordered to Bluefields, and it was upon her course thither that she struck upon Roncador reef. Thus we were deprived of a naval representative on the Central American coast, and the news was received at Washington from Minister Lewis Baker that marines from a British war ship had landed and assumed control of the situation. Subsequently, it is said, the commander of the British vessel cabled to London for instructions, and eventually withdrew his marines and left Bluefields. The incident might easily and naturally be interpreted as a kindly act on the part of the British commander, who in view of the accident to the *Kearsarge* and the absence of any other American vessel, undertook to protect American interests and property, along with the comparatively slight interests of other foreign merchants.

America will Control the Canal.

Unfortunately there has been a strong impression that the landing at Bluefields was intended to reassert a fanciful claim to a British protectorate over the Mosquito Indians—a pretense that never had any substantial basis, and that was abandoned a full generation ago. Satisfactory explanations will undoubtedly be forthcoming. Meanwhile, Admiral Benham will have manifested with sufficient distinctness our concern regarding affairs in Central America. The Bluefields situation owes its interest almost wholly to the fact that this point lies

so near the entrance to the ship canal, and that it is the well-matured policy of the United States to control, both commercially and politically, the proposed water passage between the Atlantic and Pacific oceans. The United States can have no disposition to wish Great Britain ill in her maintenance of Gibraltar and Malta, her control of Egypt, her firm possession of the Suez canal, and the maintenance at all hazards of her unobstructed route to India and Australia. The United States can look on with indifference, if not rather with positive approval, as Great Britain proceeds to appropriate larger and ever larger areas of South Africa. Nor do we object to the constant widening of British jurisdiction in Asia by the invasion from India of adjacent provinces. But this country cannot view with any satisfaction the disposition of Great Britain from her original limited foothold at the mouth of the Essequibo river to push forward the frontiers of British Guiana by appropriating territory that belongs to Venezuela. We shall naturally give all the benefit of the doubt to the self-governing republic that is on the ground, rather than to the British Empire that ought not to hold sovereignty over a foot of South American soil. The United States, also, will not admit the faintest color of British authority in Central America, nor will this country sanction any British plans for the acquisition of Hawaii.

Prosecuting Election Crimes.

Events of the past few weeks, following the conviction and sentence of McKane, the Coney Island "boss," have progressed cumulatively toward the overthrow of political cor-

ASSOCIATE DISTRICT ATTORNEY WELLMAN.

ruption in and about New York. The efficient work as prosecuting officer performed by Mr. Wellman, one of the New York associate district attorneys, has resulted in the conviction of a long list of offenders who

committed election crimes under Tammany inspiration last November. Such an object lesson has not been given to New York ward politicians since the days of the Tweed overthrow. At that time it was the chief offenders rather than the small fry who were caught in the toils of the law. It is perhaps just as desirable for practical purposes that the petty tools should at this time have been the sufferers. Election inspectors who made false returns, repeaters, perjurers who swore to blindness in order that the district or precinct boss might accompany them into the polling booth and assure himself that the votes were delivered as bought—these are the types of offenders who have been sent to prison for periods varying from a month or two up to five or six years, besides being subjected to considerable fines. Politics will be less zealously pursued by men of this class henceforth in New York. The Coney Island prosecutions meanwhile have been making progress, and Sutherland, the local police justice who was associated with McKane in the conspiracy against the election laws and a fair vote, has in his turn been convicted. In a large number of towns and cities of New York State local elections were held early in March. In the city of Troy there was much disturbance at the polls through outrages committed by precisely the same class of roughs and election criminals as have been under prosecution in New York and Brooklyn. In an assault upon honest men at one of the Troy polling places, a gang of thugs murdered a reputable citizen. This sad event promises to have the good result of leading to a cleansing of the Augean stables of Troy politics. In this connection it should be noted that some weeks ago both houses of Congress passed a bill, which was promptly signed by the President, repealing all vestiges remaining on the statute books of laws which provide for the federal oversight, under certain conditions, of Congressional elections. An end has thus been put to such efforts as those, for instance, of John I. Davenport in New York City, to check illegal registration and voting. But, after all, the recent experiences of New York, Brooklyn, and other cities show conclusively enough that the communities themselves must look out for the honest working of the election laws, and that federal regulation and control could afford no real remedy. The repeal of the federal election laws will not militate against the interests of either party in New York City next November nor in the presidential contest of 1896.

Republican Hopes and Prospects. It is not strange that the Republicans are looking forward toward the Congressional elections next November with revived hopes and anticipations. The unprecedented commercial stagnation of the past winter, continuing as it does with little abatement, has been anything but helpful to the party in power. During the discussion of the Wilson bill in the House of Representatives, two special Congressional elections were held in New York City districts. Tammany had made two vacancies at Washington by calling Mr. Fitch home to become City Controller and Colonel Fellows to become Dis-

trict Attorney. It was not supposed that there would be any difficulty in electing Democrats to fill their vacant seats in the House. A short but spirited contest resulted in Republican victory in one of the districts, while nearly all of the usual Democratic majority was swept away in the other district. The successful Republican was Mr. Lemuel E. Quigg, a talented young journalist of the *New York Tribune* staff. The successful Democrat was Mr. Isidor Straus, a prominent dry goods merchant who carries on a great business under the well-known firm name of R. H. Macy & Co., who is highly esteemed as a philanthropist and a political reformer, and who is

HON. LEMUEL E. QUIGG.

eminently worthy of a seat in Congress. Apart from personal considerations, the result of the election in these two districts was immensely encouraging to the Republican party, because it indicated a sweeping reaction. Not long after these New York City elections, a vacant seat in the Pennsylvania Congressional delegation required the choice of a congressman at large. The Republicans nominated Mr. Galusha A. Grow, who had many years ago spent several terms in the House and had at one time filled the office of Speaker. Great interest was shown in this election because the entire State of Pennsylvania was to participate in it, and because the tariff question was to be made the one issue. Mr. Grow was elected by a plurality over the Democratic candidate of nearly 188,000. The Pennsylvania Re-

publican plurality in the presidential election of 1892 had been less than 64,000. Mr. Grow's plurality is much the largest that has ever been given in that State. The local elections in March throughout the State of New York indicated, unmistakably, a strong Republican tide. Spring elections in several other States have shown the same tendency. The Republi-

HON. GALUSHA A. GROW.

cans of New York State are counting upon electing a successor to Governor Flower, and the question of a candidate is assuming much interest in party circles.

New York Legislative Topics. The New York State Legislature has had in hand a series of important measures affecting the great metropolis. It has passed a bill authorizing the submission of the question of municipal consolidation to a popular vote of the people of New York, Brooklyn, Staten Island, and certain other adjacent areas at the next November election. There is every prospect that the people will ratify by a large majority this magnificent proposal for a "Greater New York." The Legislature has also set on foot an investigation into the police system of New York City and the alleged connivance of the police department with crime and election frauds. The inquiry promises to be a very extended one, and it is hoped that it may be thorough. Dr. Parkhurst's society and the New York Chamber of Commerce are actively abetting the work. Some form of newly constituted police supervision is expected to pass the Legislature. All authorities, outside of those who have partisan ends to gain, favor a single police commissioner. The Legislature has been at work upon an improved ballot law and a safer and fairer system of electoral inspection. A very important bill has been drawn up by the New York Chamber of Commerce providing for the construction on the city's

own financial credit of an underground rapid transit system, the lines to be operated on a lease by a private company, but the property to belong to the city. The bill is feasible in every way and sound to the core. It is almost unanimously supported by the metropolitan press, and it is believed that the Legislature will pass it.

A Proposed Temperance Law.

A very interesting measure is a bill which originated with the Hon. John O'Donnell, who has been conspicuously identified with reform legislation in the State of New York for several decades. Mr. O'Donnell's bill is intended to bring together on a practical platform all shades, schools and cliques of temperance people. It may be characterized as an improved form of local prohibition. It provides a plan by which a majority of the legal voters of any town, county, or city ward, together with a preponderance of the tax-paying interest of the community, may sign a petition against the granting of licenses to sell intoxicating liquor. If the petition is sustained both by a majority of all the legal voters and also by men and women who pay more than half the taxes of the community, no

HON. ISIDOR STRAUS.

liquor licenses shall be granted for a period of five years. At the end of five years the success of a like petition would secure prohibition for a further term. Mr. O'Donnell's system has the advantage of taking the saloon question entirely out of party politics, and it provides a method by which the real wishes of a community may be carefully and deliberately ascertained and obeyed. At present, there seems little probability that this bill, the details of which have been worked out with very great care, will receive legislative attention this year. But if the opponents of the saloon throughout the State should

suddenly conclude to join hands and flood the Legislature with petitions in behalf of the O'Donnell bill, something quite surprising and unexpected might happen.

Gladstone's Retirement and the Fight Against the Lords.

The month just gone has forced upon public attention two British topics of commanding moment. One is constitutional, the other is personal; yet, grave as is the constitutional issue, the personal stirs the deeper concern. The conflict between Lords and Commons seems to mark no such turning point in British history as does the retirement of Mr. Gladstone. His noble career is fittingly characterized for our readers this month by Mr. Stead, who also writes with his accustomed perspicacity concerning the new Premier, Lord Rosebery. It is a strange irony of fate which calls a Peer to lead the Liberal Party at the very moment when the Party is nerving itself for what it would like to consider a final conflict with the Peers. It is of a piece with the cynicism of the situation in which the past weeks have set the Upper House. The Lords have been cruelly disillusioned. In throwing out the Home Rule Bill last year they knew they had behind them the majority of the representatives of England in the Lower House. By that fact they felt emboldened to despise the mandate of "the Celtic fringe." They found themselves, as they imagined, rewarded for their courage. When they had destroyed the bill there was scarcely a whisper of popular agitation. By their own side they were lauded to the skies as the very saviors of the Empire. They were held up as models of patriotism and public virtue. The Commons were correspondingly disparaged and vilified. The Lords were told that they were the truly representative chamber; by some inscrutable process they had a better right to speak for the nation than the spokesmen whom the nation itself had chosen. The Peers would not have been mortal had they remained unmoved by such overflowing adulation. Their spirits rose. They began to believe what was told them so eloquently and so oft. No longer a chamber inwardly conscious of existing only on sufferance, they began to consider themselves a real and not a nominal branch of the legislature. Forgetting that a non-elective house is an anomaly and an anachronism in a democratic state, they showed signs of supposing that they were empowered, trusted, honored by the nation not less, perhaps more, than was the other House. They defied the Commons once and again. And still no harm came to them. Demos slumbered heavily, and they mistook his heavy breathing for a murmur of approval. So they took a step further. But that was just one step too far. Semblances gave out. Realities asserted themselves. The dream of the Peers was over. They found they were living in a democracy after all. Not they, the stately and heroic saviors of Empire, but the Commons—the noisy, vulgar, Irish-led Commons—represented the will and the power of the nation. The Lower House was supreme. The Upper House was compelled, however reluctantly, to submit.

What the Peers Tried to Do.

A *résumé* may be valuable. The quarrel between the Houses during February ran this course: On the 1st the Peers began to consider the Parish Councils Bill in committee. When it left their hands on the 11th it had undergone extensive alterations. The most important of these alterations, being likely to afford the occasion of much later discussion in the campaign against the Lords, may as well be enumerated. They form an interesting revelation of the inner attitude of the Lords temporal and spiritual to local self-government.

The Peers' amendments made parish councils optional for all villages having less than 500 inhabitants; thus rendering adoption doubtful in more than four thousand villages.

They took away the right of the Parish Council to hold certain of its meetings in the church schoolroom; thus leaving in a number of cases only the alternative of the public-house. Mr. F. C. Gould hit off the situation in his now almost historic *Westminster* cartoon.

They required the order for compulsory sale or hire of land for allotments to come before Parliament; in many cases an all but prohibitive condition; and the cost was further increased by allowing compensation to be given for compulsory sale.

They limited the local power of adopting adoptive Acts, such as for establishing Free Libraries, etc.

They necessitated the levying of a separate rate to meet the cost of election.

They retained church wardens as trustees of non-ecclasiastical charities, and took away the power to appoint a majority of trustees of such charities.

They excluded the London Vestries from the scope of the Bill.

They took away from the Chairman of the Council the office of justice of the peace.

They allowed only those who paid rates directly (and not in the rent through the landlord) to be eligible as Councilor or Poor Law Guardian; thus excluding most of the agricultural laborers. Lord Salisbury wished similarly to limit the voting qualification—thus disfranchising most of the agricultural laborers—but was prevented by the opposition of the Duke of Devonshire.

The readiness with which the bishops generally supported these anti-democratic amendments has called forth angry remonstrances from radical churchmen, and is certainly not likely to win Hodge's vote for the establishment.

Employers' Liability Discharged.

The House of Commons having reassembled on the 12th, proceeded next day to consider the Employers' Liability, as amended by the Lords. An amendment to allow the privilege of "contracting out" for three years to firms which had already made insurance agreements with their workmen was accepted by the Government as a compromise, but carried only by a majority of 2 (215-213). Earl Dudley's clause permitting "contracting out" was then refused by 219 to 197. On the 19th, the bill came back to the Peers, and once again the Dudley clause was inserted. Next day the unfort-

unite bill reappeared in the Commons. Mr. Gladstone was to have moved that the Lords' amendments be "laid aside," and a great oratorical attack on the Peers was expected; but the Speaker ruled the motion out of order, and the Premier had to content himself and disappoint his followers by meekly moving that the bill be discharged. So the much-debated measure was finally slaughtered. So far the Peers had triumphed. Two out of the three great bills of the session they had directly or indirectly destroyed.

*The Retreat
of
the Peers.*

But over the third they came to grief. The week in which the Commons re-assembled was also the week of the National Liberal Federation at Portsmouth. The chief significance of these meetings was that they gave unmistakable voice to the indignation roused in the country by the Peers' treatment of the Parish Councils Bill. Ministers and delegates confirmed each other in the determination to bring the Upper House to its knees. The Liberal majority gathered in the Commons in full fighting form, but practically there was no foe for them to fight. The Peers were deserted by their own party in the Commons. The Liberal Unionists refused to forswear their democratic principles at the invitation of the Lords. So it was known before the bill was returned to the Upper House almost exactly as it had arrived there three weeks previously, that the Peers were to "climb down." The process of climbing down was done on the 23d. It was performed with great reluctance and with some attempts at securing a compromise. But, except in one or two minor matters, the Commons still declined to make concessions. Again returned to the Peers, Lord Salisbury insisted on again amending the bill, raising from two hundred to three hundred the number of inhabitants requisite to insure the formation of a Council, and handing over to the Charity Commissioners the duty of fixing the number of trustees for parochial charities. On March 1st, Mr. Gladstone ended the game of battledore and shuttlecock by accepting these two amendments under protest, at the same time declaring war against the Lords. Whatever prestige the Peers gained by their rejection of the Home Rule Bill, they have done their best to destroy in their treatment of the Parish Councils Bill. Their best friends can only lament this ungracious attempt to rob the villagers of the right of self-government. This speech of March 1 was Mr. Gladstone's last utterance as Prime Minister, and it made a profound impression. It left a tremendous indictment of the House of Lords, and a demand for its abolition or reconstruction as a legacy to the Liberal party.

*Ending,
Mending or
What?*

The Peers have not disguised their intention of rejecting certain measures which the Government proposes to carry through the Commons in this new session, such as, for example, "One Man One Vote" and "Welsh Disestablishment." If these threats are fulfilled, the agitation against the House of Lords will be kept up until the

dissolution of Parliament, when the fate of the Lords will be the question on which the elections will turn. The precise form which the question will take is being gradually evolved. There are some four leading suggestions:

1. Already an association has been formed for the total abolition of the House of Lords. The example is cited of Ontario, Manitoba and British Columbia, which have all done away with their second chamber. Only the other week the Lower House of Nova Scotia petitioned the Imperial Government to rid the Colony of its Second Chamber. The intervention is needed because the members of that Second Chamber, although pledged in writing to vote for its abolition, have violated their pledges. This suggests the greater difficulties of "ending" our Second Chamber.

2. A withdrawal of the power of veto from the House of Lords, allowing it to retain all other functions. The veto of the Peers would go the way of the Royal veto.

3. Reconstruction of the House with a restriction of the hereditary and increase of the elective or representative element. Schemes of this nature have been plentifully put forward, occasionally by Gladstonians, oftener by Unionists. The county councils are often suggested as a suitable electoral college.

4. The adoption of the Referendum to settle the fate of bills on which the two Houses fail to agree. Mr. Balfour leans to this idea; Mr. Campbell-Bannerman calls it "an outlandish invention." Each gentleman may perhaps be taken to represent the general feeling of his party.

Of these, the second seems to be securing increasing Gladstonian support, and it can plead the merits of simplicity and continuity.

MR. LABOUCHERE.

*The First Days
of Rosebery's
Government.* The extreme Radicals, led by Mr. Henry Labouchere, were bitterly averse to Lord Rosebery's succession to the Premiership. They maintained, with a good show of logic, that the prime minister ought, under any circumstances, to be a member of the House of Commons. But at the present moment particu-

larly, when a great fight was pending against the Lords as a co-ordinate branch of the law-making power, Mr. Labouchere contended that the premiership ought to pass to a commoner. The Radicals were not heeded, however, and Lord Rosebery assumed office amidst great enthusiasm. The Cabinet remains practically as under Mr. Gladstone, Lord Kimberley being shifted to the post of Foreign Minister which Lord Rosebery had held, Mr. Fowler succeeding Kimberley as Secretary for India, and Mr. Shaw-Lefevre taking the Presidency of the Local Government Board. The new order of things came perilously close to shipwreck in its very first days. The Queen had accepted Mr. Gladstone's resignation on March 3d, and Lord Rosebery had formally taken office on the 6th. The new session of Parliament opened on March 12th. On the morning of that day Lord Rosebery had given the leaders of the Liberal party an outline of his policy

in a speech which left nothing to be desired for frankness. He pledged himself to stand firmly upon Mr. Gladstone's platform as to Home Rule for Ireland, and was even more outspoken than his eminent predecessor in condemnation of the House of Lords. The first business of each session of Parliament is the reading of a little statement of information and of policy known as the "Queen's speech." It is of course drawn up by the Government in power, and its acceptance precisely as it stands is deemed necessary as evidence that the ministry possesses the confidence of a majority of the House. But Mr. Labouchere on the 13th took advantage of the lunch hour and the inadvertence of the unsuspecting Liberal leaders by moving an amendment to the Queen's speech recommending in effect the abolition of the House of Lords. The Irish members and many of the more radical Liberals followed Mr. Labouchere, and the amendment was passed by a vote of 147 to 145. There was great consternation in the Liberal camp, and for a time there seemed nothing for the cabinet to do but to resign in accordance with the undeviating practice which has been to regard the passage of an amendment to the Queen's address as equivalent to a vote of want of confidence in the ministry. Sir William Harcourt, however, found a way out of the difficulty. He declared that the question of the House of Lords was one to be considered with great care and deliberation, and that the present Government declined to accept Mr. Labouchere's rash amendment. Sir William thereupon moved the rejection of the address as amended, explaining that he would substitute for it a new address. His proposals were accepted by a satisfactory majority, and Mr. Labouchere found himself left almost completely alone in his position. While the action of Mr. Labouchere had thrown the Commons into turmoil, Lord Rosebery himself was making yet more serious trouble for himself and his cabinet by a speech in the House of Lords which seemed to commit him to the proposition that Ireland was not entitled to Home Rule until a clear majority of the members of Parliament from England alone,—not counting the Irish, Scotch and Welsh members,—should give their consent to a Home Rule bill. This is precisely the position which the House of Lords itself had taken in rejecting Mr. Gladstone's bill sent up from the House of Commons last year. It may be true as an historical forecast that Ireland will not attain Home Rule until the preponderating sentiment of England freely accords the boon. But the Gladstonian contention has been that, as a matter of right and justice, the majority of the total membership of the House of Commons should suffice; and that the Lords should not obstruct the expressed will of such a majority. Lord Rosebery's words created a tremendous excitement, and there was consternation throughout the rank and file of the Liberal party. John Morley, who continues as Irish Secretary, assured the House of Commons that Lord Rosebery's meaning had been misinterpreted; and Lord Rosebery himself, in a great speech at Edinburgh a few days later, set him-

self right with the Liberal and Radical masses. The new Government will have a hard row to hoe; but it is united, talented, courageous and aggressive, and is likely to accomplish much before it retires from the field.

*Close of the
Russo-German
Tariff War.*

Questions of political economy have been dominant during the past month in the international situation. The readjustment of commercial treaties alone promises to put quite a new face on the prospects of European peace. The tariff war which has been waged with much bitterness between Russia and Germany is now practically at an end. The treaty which has just passed the Reichstag substantially reduces the duties on manufactured goods from Germany, such as textiles, pottery and hardware, and abates the tax on Russian grain from $7\frac{1}{2}$ to $3\frac{1}{2}$. The two powers stand to each other henceforth on the footing of "the most favored nation," Russia thus entering the league of modified commercial reciprocity, which now includes Germany, Austria, Italy, Belgium, Switzerland, and other minor States. The treaty is concluded for ten years, but is terminable on a year's notice by either Government. It is a great stroke for peace, and is another monument to the pacific purpose of the Czar. As the Kaiser has told us, its concessions to Germany are "entirely due to the personal intervention" of the Russian monarch. The younger Emperor has done his level best to profit by his elder's example. He loudly warned the Reichstag that rejection of the treaty would soon transform the tariff war into a real war. By his return visit to Prince Bismarck at Friedrichsruh he completed the reconciliation which practically deprives the Agrarians of their leader. The prospect of a general election with the alternatives of "the Treaty" or "dear bread and war" destroys the power of the opposition, even though the Agrarian league is said to number 178,000 members. The settlement of the economic quarrel between the two peoples by such determined and puissant peace-makers augurs a deeper and more stable agreement.

*Franco-
Russian
Coolness.*

By a strange coincidence or providence, at the very time that Germany and Russia are breaking down the tariff walls which have divided them, France is busy erecting barriers against the importation of Russian along with all other foreign breadstuffs. The proposal of the French Tariff Committee was to raise the duty on imported cereals from five to ten francs a quintal. The Russian press remarked indignantly on this novel method of attesting the affection which the French had been effusively asserting; and though the Czar silenced these public complaints, yet it is probably due to his remonstrances that the French Government, backed by the Chamber, refused to go beyond a tax of seven francs. Nevertheless, this compromise is said not to satisfy Russian exporters. The net result of the month's fiscal arrangements thus seems to be the weakening of two potent conditions that might make

for war—the Russo-German friction and the Franco-Russian friendship.

*Putting
on the
Last Straw.*

The Budget proposals of the Italian Government could not be of a kind to excite enthusiasm, there being a deficit of \$35,000,000 to face. But Signor Crispi has shown himself the strong man once more; for whatever we may think of his general policy, we cannot deny that he has suppressed the eruption of tumult with remarkable rapidity, and has faced the financial difficulty with a resolute courage which commands respect. The scheme of his Ministry is to reduce expenditure by five million dollars—being given for this purpose a free hand in civil and military reform; to save ten millions by conversion of 5 per cent. to 4 per cent. bonds, and to impose twenty millions of additional taxes. This increase in a load already scarcely bearable threatens to result in the bankruptcy of a yet vaster number of small land-proprietors, and in a perilously enlarged proletariat. Happily the hateful local octroi duties which were a principal cause of the recent risings are to be abolished. Signor Crispi attributes the recent rising wholly to Socialist plotters working in hope of Russian aid. The centre of the disorders was by no means a poor district—the land was owned by the peasants.

*The State as
Rural
Money-Lender.*

The protection of the yeomanry, if not from the tax gatherer, yet from the more ruinous exactions of the money-lender, seems to be a matter of anxiety to several widely-parted States. Even Greece in her insolvency has ventured to start a Government Bank with a fund of nine million drachmas for lending money to fruit-growers at a yearly interest not exceeding eight per cent. And away at the Antipodes the Government of Victoria has determined on advancing from the Savings Bank small loans at five per cent. per annum to farmers in order to enable them to improve their estates. New Zealand has resolved on a similar fostering policy.

*The
Australian
Revival.*

These are some of the measures which warrant the hopes expressed by our Australasian editor:

The sky of the new year (he declares) is for these colonies really full of brightness. The banks, with scarcely an exception, are in full and profitable operation again. The colonies, one after another, are blossoming, as trees do in spring time, with new industries. Our labor troubles are losing their bitterness. A new and wise economy is visible in all State administration. The sense of a community of interests betwixt the colonies has been quickened by the troubles in which all have shared, and the prospects of Federation in one shape or another were never before so bright.

This last statement is directly confirmed by Sir Henry Parkes, writing in this number of the REVIEW. He testifies to the universal popularity of the very word "Federal," and he commends the union of Australian States as "the watchword of the great Australian party in every electoral contest in every part of

Australia." This elimination of Shylock, by the State's taking his place, is a measure which might, if successful, effect a most salutary revolution in the economics of agriculture. It might do much to mitigate the grievances which have made anti-Semitism popular in Europe. Even if the borrower succumbed to what has been too often his fate hitherto, and the State from creditor and mortgagee became ultimately proprietor, the community instead of the individual money-lender would be the gainer, and the accumulation of land in a few hands would be further off than ever. A blessing it would be if by some such methods the miserable peasants of India could be relieved from their burdens. But to re-install the State as landlord, and so to undo the imported mischief of the British system of landlordism, seems to be a goal as remote as the course thither must be painful and laborious.

*Silver and
Opium.*

The immediate and pressing task of the Indian government is to pay its way and get its currency established on a sound basis. The silver crisis grows more and more acute. There is consternation in the monetary circles in India, and the Bank of Bengal has raised its rate of discount at a bound from four to nine per cent. The India Council's bills have been selling so low as to bring only a fraction over fourteenpence for the rupee. The deficit which will appear in the Budget to be presented this month is estimated at 350 lacs of rupees. There are, of course, the powers conferred by Imperial Parliament to borrow as much, if need be, as ten million pounds sterling. But the worst of the situation is that, confronted by a problem and a peril which are simply colossal, everybody—statesman, financier, or merchant—is completely in the dark, and has no inkling which way light lies. Yet political economy is supposed to have been a science for more than a hundred years. It is to be hoped that the Opium Commission will not find itself, at the end of its labor, in an equally hopeless perplexity. The cabled account of the conflicting evidence submitted tends to make the puzzled reader accept the psalmist's sweeping indictment against human veracity. Already serious charges have been advanced against Indian officials of tampering with witnesses, intimidating or otherwise preventing them from giving evidence against the use of the drug. In any case, the Report, when it appears, will be looked for as a curiosity among Blue Books. An outbreak of a religious feud at Yeola, near Bombay, in which Hindu temples and Moslem mosques were destroyed, furnishes a fresh reminder of another permanent aggravation of England's Indian difficulties.

*The Verdict
of the
Cape
Elections.*

The Europeanizing of Africa goes slowly forward, although at a cost both in blood and in morals which is not always sufficiently realized. Thanks to the prompt firmness of Lord Rosebery and the men who represent England in the valley of the Nile, the recalcitrant Khedive has been brought to his senses. The well-

earned knighthoods awarded to General Kitchener and Mr. Scott, judicial adviser, followed with impressive promptitude upon His Highness' indiscretions; and the appointment of Zohrab Pasha, who is an Armenian, a Christian, and a friend of England, as Under Secretary for War in place of the summarily discharged Maher Pasha, shows that the incident is safely over. The same cannot unfortunately be said of Mr. Rhodes' immensely more serious difficulty with the Matabele monarch. In default of certain information, rumor has been very busy with Lobengula, now killing him off with small-pox and stationing guards at his grave, now resuscitating him, only again to pronounce him dead. Whatever view may be taken at home of the campaign which has driven the dusky prince from kraal and kingdom, South African opinion has declared itself practically solid in its support. The General Elections to the Cape Parliament have confirmed Mr. Rhodes in his premiership, and still more unmistakably in his northern policy.

*Blots on the
German
'Scutcheon.'*

No doubt persons who think that Mr. Labouchere and his anonymous witnesses outweigh in value the verdict of the entire electorate of the Cape, will not be slow to argue that white men among black men are less likely to judge them fairly than white men far away. The recent history of Africa supplies only too many cases in point. During February it was established that Herr Leist, acting governor of the German colony of the Cameroons, had caused the wives of his black soldiers to be publicly flogged in their presence, not because they, poor women, had been guilty of any offense, but because their husbands had been lazy! The troops, not appreciating the justice of this vicarious punishment, mutinied: to the credit of black manhood be that fact recorded. When faced with the facts, the authorities at Berlin are insisting that "it is imperatively necessary to give the higher officials in Africa considerable freedom of action." Chancellor Caprivi has, moreover, had to admit the truth of the charge that a Hamburg firm had been buying from the King of Dahomey a number of slaves. The measure to make traffic in slaves a criminal offense is promised by the German government. The arms and ammunition which the Dahomeyan obtained in exchange for his slaves he wanted for the war with the French.

*Cost of
Civilizing
Africa.*

The peaceful partition of Africa, of which so much has been said, is evidently going to be carried out amid a constant sputter of little wars. Even the peaceful partitioners are falling foul of each other by accident, for want of frontiers marked as clearly on the surface of the continent as they are upon the maps at home. The mistake French troops made in British territory on Christmas Eve, British police have, it is alleged, repeated on French soil. And the strong tribes already in possession are not going to be ousted or crushed without a struggle. On January 12, two days after a French column had calmly appropriated Timbuctoo, its commander and a detachment which had

gone reconnoitering with him were simply wiped out by the Tuaregs. The serious disaster which Fodi Silah inflicted upon British troops on the Gambia on February 22 is another proof that, despite all treaties and international precautions, the slave-trade means to die hard. Fifteen men killed and forty wounded, with the loss of artillery and the repulse of a gun-boat, make up a heavy bill for a single raid. Yet whatever it costs to wipe Africa clean of slavery, it is the amends civilization is bound to make. That the Sultan of Morocco has at last yielded to the ultimatum of the Spanish Court is accepted as a sign of the close of the Melilla difficulty. The flames of religious war are happily not to be rekindled there.

*The Late
W. F. Poole,
of Chicago.*

Few Americans of our day have rendered better service to the world than the late Dr. William Frederick Poole, of Chicago, who died on the first of March. Dr. Poole deserved to be called the Nestor of American librarians. He was one of our chief authorities in all matters pertaining to library science and the librarian's profession. He was born seventy-two years ago in Salem, Massachusetts, and graduated from Yale College at the age of twenty-five. During a considerable part of his college course he served as a librarian in one of the literary societies, and at that time conceived and executed the plan of a topical index to the bound volumes of standard reviews and periodicals which rested almost unused upon the library shelves because of the practical difficulty of getting at their contents. Upon leaving college he entered immediately upon his chosen life work of librarian. His first index to periodical literature was published in 1848, and was a small volume. Its last edition, many times larger, with the supplements that have appeared to keep it up to date, has unlocked for English readers everywhere a vast storehouse of literature. It would hardly be an exaggeration to say that during the present century more than half of the most valuable literary productions of the men and women who write in English have appeared in the form of contributions to the periodical press. Librarians had managed, whether very scientifically or not, to index their collections of books well enough to make them available for use; but accumulation, through decades upon decades, of bound quarterly and monthly reviews and magazines had baffled them. Thanks to William Frederick Poole, the libraries have been enabled to multiply their working availability by two, if not by three. Dr. Poole lived for many years in Boston, having charge there successively of two great libraries. Subsequently he became the head of the Cincinnati Public Library; and afterward he built up from insignificance to a point of great strength the Public Library of Chicago. He had also at different times, in the capacity of library expert, briefly served various cities in the founding and opening of public libraries. When Mr. Newberry's great bequest of several million dollars for a library in Chicago became available in 1887, Dr. Poole accepted a flattering invitation to take charge of this new establishment.

L. Kossuth

LOUIS KOSSUTH, HUNGARIAN PATRIOT.

He worked out the plans for the great Newberry library building, and meanwhile began the accumulation in temporary quarters of a nucleus of literary treasures. In these six or seven years he has already made the Newberry collection a very remarkable one in several respects. But Dr. Poole was much more than a library expert or a buyer of books. He was a great educator. Whether in Boston, Cincinnati or Chicago, he made the libraries under his charge an essential factor in the intellectual and educational life of the community. He was a teacher of teachers, a sympathetic helper of students and literary workers, an inspiring friend to hosts of young men, and particularly an enthusiastic coadjutor of workers in every department of American history. The intellectual life of Chi-

DR. WILLIAM FREDERICK POOLE.

cago owes Dr. Poole a great debt. This brief summary of his services would be very incomplete if due recognition were not given to his position as an original investigator and an American historian. He made himself our first authority upon several subjects. He took advantage of his residence in Boston to delve deeply into early New-England history, and he compelled Boston and the world to accept a wholly new version of the story of New-England witchcraft. His residence in Cincinnati gave him opportunity to study the historical origins of the great region north of the Ohio river, and he became our first authority upon the Northwest Ordinance of 1787. In like manner, his long years of labor at Chicago made him master of more than one field of Western history. His position as historical scholar and writer was recognized by the American Historical Association, of which distinguished body he was president for several

years. It is needless to say that the librarians of the country fully recognized his authoritative place in their profession, and honored him frequently and continuously in their associations and conferences. Although he had been a librarian for nearly half a century, he died, after a short illness, in the very midst of a busy career in which there had been no sign of flagging energy or abatement of force and power.

*The Death
of
Louis Kossuth.*

While the friends of the Hon. Neal Dow, of Maine, were on the 20th of March celebrating his ninetieth birthday with many words of deserved eulogy and congratulation, another nonagenarian was dying far from his native land and in circumstances of gloom and sadness. Louis Kossuth died at his home in northern Italy on the evening of Tuesday, March 20th. His career as a public man ended many years ago, and his influence for nearly three decades has been really of the historical and posthumous sort, rather than that of a participant in contemporary affairs. His old age was shrouded in gloom and disappointment because he believed that his life had totally failed to accomplish the great object to which he had devoted it—namely, the political freedom of his beloved Hungary. To his mind, there was no freedom for Hungary short of absolute separation from all connection with Austria and above all, from all allegiance to the house of Hapsburg. In 1848 he had, after fifteen or twenty years of courageous and marvelously brilliant effort, succeeded in winning a brief independence for Hungary, and he was honored with its governorship. But through Russian assistance Hungary was again subdued by Austria. Kossuth fled to Turkey, where he was imprisoned. It is one of the most creditable circumstances in the history of the United States that our government actively intervened to prevent the giving over of Kossuth to Austria by the Turkish authorities, and that we sent one of our war ships to bring him to the United States as the nation's guest. The Emperor Napoleon II would not permit Kossuth on his official visit to America to cross French territory. At least Kossuth lived to see the end of French imperialism, and that was much. His visit to the United States is one of the bright chapters in our history. His eloquence, as described by those who heard him here in 1851, has not been surpassed by any political speaker in this century. Until his dying day he would never admit the rightful sovereignty of the Emperor Francis Joseph over Hungary, and remained therefore an exile, making his home in Italy and supporting himself by his pen and by giving language lessons. It was very unfortunate that Kossuth could never appreciate the fact that by the arrangements established in 1868 Hungary really attained all that was substantial in her demand for freedom, and that now for a full quarter of a century the Hungarians have been as truly self-governing and as totally free from all semblance of a foreign yoke as any nation in Europe. And this condition was really made possible by the earlier work of Kossuth and his associates.

THE LATE MR. JOSEPH KEPPLER, OF "PUCK."

Every reader of THE REVIEW OF REVIEWS knows something of the late Mr. Keppler's wonderful gift of caricature. His cartoons, perhaps more than those of any other person, have served to enliven our department "Current History in Caricature." Mr. Keppler was the founder of *Puck*, and, to the day of his death, February 19, its inspiration. He gave to this paper the affection of his whole heart and the full measure of his artistic powers, and through it he established humorous and satirical journalism in this country on a firm basis.

And the Protectionists can't keep their snow man from rapidly melting away. —From Puck.

AND THEY DON'T KNOW EACH OTHER!

This is the first time in the history of New South Wales for ten years that the income and expenditures have met. —PREMIER DIBBS.

From The Sydney Bulletin (N. S. W.).

MELBOURNE, Thursday.—A demonstration was held to night at the Congregational Church in favor of the extension of the franchise to women. There was a very large attendance of women and girls, and no less than 15 resolutions were carried providing for reforms of a most sweeping and distinct character. The suppression of smoking altogether was one of the modest demands, while the removal of the penny-in-the-slot cigarette machines from railway stations and the abolition of the liquor traffic were asked for. Protests were also entered against theatrical performances and Sunday trains.

RECORD OF CURRENT EVENTS.

February 18.—Three thousand miners at Massillon, Ohio, are thrown out of work till they accept the terms of the mine operators. . . Demonstration in Trafalgar Square against the action of the House of Lords with regard to the London vestries.

February 19.—John Y. McKane, the Gravesend (N. Y.) political boss, sentenced to six years at Sing Sing for election frauds and intimidation. . . Anarchists arrested in France. . . Emperor William received by Prince Bismarck at Friedrichsruh. . . French Chamber continues debate on socialism.

February 20.—Galusha A. Grow elected Congressman-at-Large for Pennsylvania by a plurality of more than 180,000. . . California Labor Congress begins its sessions in San Francisco. . . During the Cornell University freshman banquet, at Ithaca, N. Y., a colored dishwasher is killed by inhaling chlorine gas, and several students are temporarily overcome; it was supposed at first that the gas was introduced into the room by the sophomores, but they disavowed the act, and subsequent investigations did not disclose the real culprits. . . Bomb explosions in Paris. . . Reassembling of Italian Chamber.

February 21.—The unemployed of Boston throng the State House, and are dispersed by order of the Governor; the Massachusetts legislature appoint a committee to consider their demands and to investigate present industrial problems. . . The United States and Great Britain agrees on legislation to give effect to the decision of the Bering Sea arbitrators. . . French Chamber passes bill for increasing corn duty. . . Demonstration in Vienna in favor of universal suffrage.

February 22.—President Peixoto sends to the American legation at Rio a Washington's Birthday greeting. . . National Executive Committee of the People's Party in session at St. Louis. . . A syndicate acting for the Salvation Army buys a tract of 200,000 acres in Chiapas, Southern Mexico, on which 5,000 families from England and the United States are to be settled under the direction of officers of the Army. . . Signor Biancheri elected President of the Italian Chamber.

February 23.—Indictments found against various Michigan State officers for altering returns of elections on salaries amendments to the State constitution. . . British House of Lords accepts certain amendments of the Commons to the Parish Councils bill, but adheres to former position relative to the control of charities. . . The Bengal Chamber of Commerce votes against the reopening of the silver mints. . . In the Anarchist trial at Vienna eight of the accused sentenced to penal servitude. . . The crew of the gun-boat *Widgeon* attacked on the West African Coast; 13 killed, 45 injured.

February 24.—Prendergast, the murderer of Carter Harrison, sentenced to be hanged March 23. . . British sailors killed in ambush by slave dealers on the West Coast of Africa. . . Opening of the Battersea Polytechnic Institute by the Prince and Princess of Wales.

February 25.—President Cleveland starts on a hunting trip in North Carolina.

February 26.—Mr. Bland's bill for the coinage of the silver seigniorage considered in Committee of the Whole. . . The Brazilian insurgent steamer *Venus*, at Rio, sunk by an explosion caused by a sailor dropping a shell in a magazine. . . Debate on the German-Russian commercial treaty begun in the Reichstag. . . Meeting at Calcutta to consider the financial situation of India. . . Victory of British troops in West Africa.

February 27.—Resentment shown by Irish Home Rulers against Hon. John Morley because of his refusal to receive a deputation of evicted tenants.

February 28.—The "Greater New York" bill signed by Gov. Flower; the bill submits to a popular vote of the communities interested on November 6 next the question of consolidation with the metropolis under one municipal incorporation; the annexation proposition not only includes Brooklyn, with a population of nearly 1,000,000, and Richmond County, with over 50,000 inhabitants, but thirteen towns and villages, of which Long Island City, with a population of 30,506, is the most important. . . In a battle between striking miners and men at work in West Virginia, several killed and wounded. . . The state of siege at Rio abolished. . . Extradition treaty with Great Britain adopted by the Roumanian Chamber.

March 1.—Mr. Gladstone, in his final speech as Prime Minister, declares that the nation must decide the questions at issue between the Commons and the Lords. . . The New York Chamber of Commerce indorses ex-Mayor Hewitt's plan for having the city bonded to build underground rapid transit roads. . . Alabama miners hold a caucus, indorse Kolb for Governor, and nominate candidates for the legislature. . . Corbett found not guilty of prize fighting at Jacksonville, Fla. . . The German-Russian treaty further debated in the Reichstag and referred to a committee.

March 2.—Congressman Dunphy, of New York, resigns from the Tammany General Committee, because of alleged illegal election practices. . . Six men sentenced for election crimes at New York, five of them pleading guilty. . . Pope Leo's 84th birthday and the sixteenth anniversary of his coronation. . . Brazilian insurgents defeated at Sarandi, with a loss of 400 killed and many wounded; Moraes and Pereira, candidates for president and vice-president respectively of Brazil, receive heavy majorities. . . A British force lands at Bluefields, Nicaragua, to protect autonomy of the Mosquito chief.

March 3.—The Queen accepts Gladstone's resignation, and the premiership passes to Lord Rosebery. . . Striking miners in West Virginia burn a railroad bridge and commit other acts of lawlessness.

March 4.—An attempt to burn another World's Fair building results in the arrest of one of the incendiaries. . . More than 300,000 persons join in a demonstration at Buda-Pesth in favor of the Civil Marriage bill. . . Thirteen anarchists arrested at Paris.

March 5.—Business part of Deadwood, S. Dak., burned. . . Annapolis celebrates its bi-centennial as the capital of Maryland. . . Republicans win in city and town elections in Maine. . . The British Parliament is prorogued; changes in the cabinet are officially announced. . . Nine more anarchists arrested in Paris.

March 6.—Republicans make gains in local New York State elections. . . President Cleveland returns from his hunting trip. . . The American Forestry Association meets in Albany, Secretary Morton presiding. . . Lord Rosebery formally takes office.

March 7.—Senator White, of Louisiana, resigns to take his seat on the bench of the Supreme Court, and Representative N. C. Blanchard is appointed by the Governor as his successor in the Senate. . . Gen. Brooke, U. S. A., issues an order discharging Capt. Ray's company of Indians. . . The English had another fight with slave dealers in Gambia. . . Collision between the English and the Portuguese on the Zambesi. . . Yellow fever at Rio assumes serious phases.

MR. G. G. FRAMPTON.

MR. JOHN S. SARGENT (AMERICAN).

MR. JOHN M. SWAN.

MR. ARTHUR HACKER.

THE
NEW ASSOCIATES
OF THE ROYAL ACADEMY, LONDON.

March 8.—Dan Coughlin acquitted at Chicago of complicity in the assassination of Dr. Cronin. . . . Proceedings are begun in the New Jersey Supreme Court to decide the claims of the rival State Senates. . . . Eight persons seriously wounded by the explosion of a bomb in front of the Chamber of Deputies in Rome; several arrests made. . . . The Parnellites issue a manifesto expressing distrust of the new British Cabinet. . . . The Reichstag Committee adopts the Russian-German commercial treaty as a whole. . . . The Spanish Cabinet resigns on a question relating to tax collection.

March 9.—Testimony before the New York Senate Committee as to police interference in elections. . . . Labor troubles continue in West Virginia. . . . A British force of 34 officers and men massacred by the Abors, in Assam, British India, after fighting two days and nights. . . . The Netherlands Parliament amends the government reform bill so as to destroy the principle of extended suffrage; the bill is then withdrawn.

March 10.—Murder results from a contest among Republicans for the Congressional nomination in the Second Tennessee District. . . . Peixoto's whole fleet arrives off Rio. . . . Gen. Manigat's steam yacht *Natalie* seized by Haytiens and her crew shot by order of President Hippo-

lyte. . . . The Russian commercial treaty passes its second reading in the Reichstag by a vote of 200 to 146.

March 11.—Heavy shortages are reported in John Y. McKane's accounts with the town of Gravesend, N. Y.

March 12.—The bodies of four entombed miners are found in the Gaylord mine at Plymouth, Pa. . . . An epidemic of typhoid fever is raging in Buffalo, caused by impurities in the city water supply. . . . Lord Rosebery outlines his policy at a meeting of Liberal leaders, promising to stand by Home Rule; the Queen's speech to Parliament promises the submission of measures relating to Ireland, the Welsh and Scotch church establishments, equalization of rates in London, local government in Scotland, direct local control of the liquor traffic, conciliation of labor disputes, amendment of Factory and Mines act, etc.; Salisbury and Balfour pay tributes to Gladstone. . . . Premier Sagasta forms a new Spanish Ministry. . . . The French Chamber of Deputies votes urgency on a bill forbidding the publication of reports of the anarchists' trials.

March 13.—At Paterson, N. J., a mob of striking dyers invade several dyeing establishments, drive the workmen out, defy the police, and destroy valuable property; the police attack and disperse 5,000 striking weavers at the same place, and break up a parade of

March 14.—John T. Ford, of Baltimore, the oldest active theatrical manager in the country, friend of Charles Dickens, Horace Greeley, James G. Blaine, and many other noted men.

March 15.—M. Mouchicourt, of Paris, judicial liquidator of the Panama Canal Company....M. Charles Detaille, the French painter of animals, brother of Edouard Detaille....Judge Artemas Libbey, of the Maine Supreme Court....Captain Frank E. Brownell, who killed the slayer of Colonel Ellsworth at Alexandria, Va., May 24, 1861, thereby avenging the first blood of the civil war shed in the South....General John L. Otis, of Northampton, Mass....Colonel E Szabad, Hungarian patriot, follower of Kossuth.

March 16.—C. L. Kimball, superintendent of the Newburg, Dutchess and Connecticut Railroad, prominent in Masonic circles....Rev. Dr. Stevens Parker, of New York, a well-known clergyman of the Protestant Episcopal Church

March 17.—James J. Fronheiser, a well-known steel manufacturer of Johnstown, Pa....Thomas S. Negus, president of the New Jersey Pilot Board.

March 18.—Mrs. John W. Noble, wife of the ex-Secretary of the Interior ...Allan Campbell, of New York, the engineer who built the first railroad in South America and later acted as chief engineer of construction for the Union Pacific Railroad; succeeded John Kelly as Comptroller of New York City in 1880.

March 19.—Commodore William D. Whiting, retired, of the United States Navy.

March 20.—Louis Kossuth, the Hungarian patriot....L. T. Goodnow, the first Superintendent of Public Instruction in Kansas.

MR. GLADSTONE INTRODUCING THE HOME RULE BILL, 1893.

THE THREE ENGLISH LIBERAL LEADERS.

MR. GLADSTONE, LORD ROSEBERY AND SIR W. HARCOURT.

CHARACTER SKETCHES BY W. T. STEAD.

I. MR. GLADSTONE.

IT is difficult, not to say impossible, for any of us to realize adequately Mr. Gladstone's final retirement from public life. He retired, it is true, once before. I well remember the feeling of blank dismay and of genuine misery which we all felt when, soon after the general election of 1874, Mr. Gladstone announced that the time had arrived when he must devote his remaining years to preparation for the other world. Yet Mr. Gladstone in 1874 was but a comparatively unimportant figure in the national drama when contrasted with the Mr. Gladstone of to-day. The last twenty years naturally leave a deeper impression on the minds of men than the previous fifty years, but even after making the necessary allowance for the illusions of time and space, the last section of Mr. Gladstone's life is by far the most striking and the most memorable. He was a great man in 1874. To-day he is a hero, already installed, even during his lifetime, in a foremost place among the chosen immortals who for good or for ill influence most deeply the destinies of our English race. How much more poignant, therefore, must be the regret, how much more aching the sense of loss with which we learned that Mr. Gladstone is to lead us no more forever!

AT THE DOME OF ST. PAUL'S.

Politics in England very much resemble the view of Eastern London as I see it every day from Waterloo Bridge. There is crowded life in the busy city and on the restless river. There are palaces and hovels, churches and warehouses, a great multitudinous expanse of offices and of dwellings. But the centre of that great panorama of life is not on the river or on the streets, in palace, or courts, or park. It is in mid-heaven in the great dome which the genius of Wren reared over the Cathedral of St. Paul. No more stately or beautiful dome ever crowned a city's glory and a city's pride. When you are sufficiently far away, the dome of St. Peter's looms majestic against the horizon through the purple haze of the Campagna. But the sense of immensity disappears as you approach it; the dome seems dwarfed by the Cathedral from which it springs. It is far otherwise with St. Paul's. Over the many steepled city and its towering streets, the great dome rises and rests easily regnant, sitting like some great queen enthroned in a purer air far above "streaming London's central roar" which rises from below. What St. Paul's is to

the city, so is Mr. Gladstone to the political world. Imagine St. Paul's blotted out, and in that eyeless socket of the city that would remain we have a picture of Parliament to-day without its chief.

HOW HE IS MISSED.

It was inevitable some time, no doubt, and we all knew that it was drawing nearer every day. But so is death, and so possibly is the advent of Macaulay's New Zealander. Yet we are not prepared for the Maori with his sketch book, and until Fate, as summoner, lays his hand on our heart and bids it rest so that the spirit may live, we go on unthinking. A calamity is seldom less calamitous because it has been predicted. Nor are we any the more reconciled to Mr. Gladstone's departure because we have said and have written many times that it must come before long. For Mr. Gladstone has been so long part and parcel of the life of the English-speaking race that it is as if we were tearing with rude hands a thread woven into the very warp and woof of our national existence. It matters not whether we loved him or whether we hated him, he was a part of us: the most conspicuous and shining part. We had to be talking of him for good or for ill all the time. He was no comet sweeping in wide ellipse through the heavens; he was rather as the sun which was always with us, the centre of our system, the giver of light and warmth. We complained of his heat sometimes, or lamented that he spared us so little of his genial rays, but even when we grumbled most the thought of a sunless world never startled our imagination in nightmare. So it was with Mr. Gladstone. He was always with us. He seemed as if he must be always with us, and his departure seems not so much a disaster but rather as if something had dropped out of the order of nature.

A NATIONAL HERO.

Looking back over the great career which has filled so nobly the canvass of three-quarters of a century, we see much in it to fill the heart with gratitude and praise. The gods have no better boon to give to mortals than a great and good man. As long as England produces men like Mr. Gladstone, the sentiment of loyalty, the habit of trust, the fervor and force of enthusiasm will not die out. The continually increasing and ever widening recognition of the sterling greatness of Mr. Gladstone is a welcome testimony to the soundness of our national judgment. England, like bluff old King

MR. GLADSTONE AT TWENTY-EIGHT.

Hal, dearly loves a man, and in Mr. Gladstone she found a man whom she was proud to follow. There was no servility in her devotion and her pride. Many a time and oft she rebuked her brilliant chief, sometimes wisely, sometimes foolishly, but, even in her most wrathful moments, her indignation was full of regret. She stormed at him all the more because she felt what an incalculable power for good he would have been on the other side. Her very censures were veiled compliments and her fiercest denunciations ungrudging tributes to his genius and his worth. It has been of immense benefit to our democracy that just as it was attaining man's estate and arriving at full enfranchisement the common people had such an uncommon man to lead them. It is indeed of the richest of the Lord's mercies to "God's Englishmen" that for the last quarter of a century they have had such an old man as Mr. Gladstone to teach them how to rule and such an old woman as Her Majesty to teach them how to reign. Between them, Mr. Gladstone and Queen Victoria have done more than any two, or than any two hundred, to give "our crowned republic's crowning common sense" a fair chance to adjust itself to the new conditions of the new time.

There is no necessity for me to attempt in these pages a review of the long, illustrious career of Mr. Gladstone. As for a character sketch, that is equally

unnecessary. We published a sketch of him before the last general election, and to what we said then we have little to add and nothing to take back. What concerns us now is not so much what Mr. Gladstone is or was, but that we are now without the continual inspiration of his presence and the stimulus of his indomitable spirit. For the very wonderful vitality of the man, his omnipresent activity and the immense ascendancy which he rightfully exerted have, like all other things, to be paid for. Nature exacts her compensations without ruth.

We may, if we please, exult in the magnificence of the growth of the mighty cedar, but beneath the shade of its far-spreading branches we must not expect to rear fresh trees. And the penalty of having had for so long so supreme a party leader as Mr. Gladstone is that we have no successor ready to take his place. I remember well fencing with this question when the Czar asked me who was to succeed Mr. Gladstone. I did not wish, as an Englishman, to be humiliated by having to name Sir W. Harcourt as a possible Prime Minister in the Imperial presence, and so I said simply: "Mr. Gladstone can have no successor. We shall no doubt have to put some one in his place after he goes, but successor, no—there is only one Mr. Gladstone." But it is no use repining at the shadows which the sun casts. Better the shadows than no sunshine, and we should be fools indeed not to choose the great man with all his drawbacks rather than consent to drivel on from decade to decade in a wilderness of monotonous mediocrities.

ITS DRAWBACKS AND COMPENSATIONS.

Mr. Gladstone undoubtedly dwarfed his contemporaries and sometimes stunted his colleagues. But

MR. GLADSTONE AT FORTY-FIVE.

the mischief which this all-canopying personality might have done was minimized by the sturdy vigor of the individuality of our race and the enormous expanse of the British Empire. Mr. Gladstone, for instance, has done nothing to cripple, dwarf, or overshadow Mr. Cecil Rhodes, who is, in many respects, the ablest and the most powerful Englishman in the Empire. That was because the Empire is broad enough to afford elbow room for Colonial Cæsars. Neither has he, to all appearance, done Mr. Chamberlain much damage by way of impairing his self-confidence or diminishing his ambitions. It is possible that in his own cabinet he has to some extent atrophied the faculties of some of his colleagues, who have been compelled for years to let him decide many questions which if he had been absent they would have decided for themselves; but even this disadvantage is perhaps more than compensated for by the stimulus which his example has afforded them, and the immense educational influence which mere contact with an administrator so superbly equipped must have exercised upon minds of less culture and less experience. It is, however, vain to speculate upon what we shall all see for ourselves before very long. The experiment of placing all power in the hands of a supremely capable chief does not seem to have had very excellent results in Ireland after the capable chief disappeared. But Mr. Gladstone never dominated his party as Mr. Parnell dominated the Home Rulers. Neither, it may be said, are the English Irish. It may be due to English selfishness, or it may be due to our obtuseness, but the instinct of self-preservation operates so powerfully with English politicians that Mr. Gladstone's party is not likely to go to pieces merely because Mr. Gladstone is no longer at the helm.

A CHURCHMAN AT BOTTOM.

Mr. Gladstone's influence upon his fellow countrymen was more that of a great churchman than that of a statesman. He reminds me much more of Becket or of Laud than of the ordinary secular politician. He was a politician, no doubt, and a wary and a wily one at that. But this astuteness which makes it as easy to catch a weasel asleep as to catch Mr. Gladstone napping is a quality much more highly developed in ecclesiastics than among members of Parliament. It is the product of the conclave much more than of the caucus. Mr. Gladstone was a man of affairs—four times Prime Minister of England, five times leader of the House of Commons—but with all his immersion in this world's business he was a man who dwelt in the other world as much at least as any of the great Cardinals who figure in history. There is about him a certain detachment of mind more natural to the member of a cosmopolitan organization than to the insular statesmen of John Bull. He never altogether seemed to identify himself with England. He represented something else. When I last saw him I mildly hinted that he never seemed to be much enthused with the greatness and magnificence of England's mission. "Well, you know," he said, "if you have a son who is somewhat forward and

MR. GLADSTONE TO-DAY.

HAWARDEN CASTLE.

is too self-complacent and you have frequently to chide him for that, you do not like to increase his complacency by sounding his praises too much. You may allow it as a treat, but it ought not to be his daily bread." There was the churchman all over. The man who sees the nation as something outside of himself which he must warn and discipline rather than as an entity of which he is part and parcel.

CONTRASTED WITH MR. MORLEY.

This, it may be said, is true of all men who hold strong views on the moral question. Mr. Morley, for instance, is as much swayed by a sense of this moral pedagogy as Mr. Gladstone; but no one would call Mr. Morley a churchman. Mr. Morley himself used to say that he ought by rights to have been a Puritan preacher, and the echoes of the thunders of Sinai are seldom long absent from his speeches. But he is not a churchman as Mr. Gladstone is. Mr. Gladstone's churchmanship is to Mr. Morley's what the full choral services in a cathedral is to the hearty singing of a Salvation Army meeting. In other words, the ecclesiastical mold is much more manifest in Mr. Gladstone's case than in Mr. Morley's. Both agree in being preachers of righteousness and justice before they are politicians. Both are constantly, in public and in private, appealing to the higher law, and both of them never forget that man is *au fond* a moral being, instead of being, as is too often assumed, a mere patent digester on two legs. But Mr. Morley has very few of the notes of the churchman. Mr.

Gladstone has them all. There have been few greater casuists, even in the Roman Church, than Mr. Gladstone. The subtlety of his intellect, as shown in splitting the finest hairs with the keen edge of almost fantastic distinctions, is the marvel and sometimes the mock of the mundane politician. Mr. Morley is a plain moralist who does no hair splitting, and presents his conclusions rough hewn from the mine. Mr. Gladstone, like all churchmen, is great in the observance of church festivals, of public worship, of fasts, and of the minutiae of ecclesiastical drill and discipline. Whether or not he uses his breviary and says his offices as regularly as a Catholic priest, no one knows; but no one would be astonished if he did. Every one is familiar with his reading the lessons at Hawarden and with the fact that he went to church thrice one Sunday when he was in the very midst of cabinet making. I remember well recalling that incident as I stood in the galleries of the Vatican waiting for the return of the Under Secretary of State. I had an appointment with him about the presentation of my memorandum to the Pope. Mgr. Mocenni was not "on time." The apology for his non-punctuality was that it was the day of some particular saint, and office business had to be suspended until prayers had been attended! Mr. Gladstone was quite capable of doing that. Mr. Morley is not. Mr. Morley, thanks to his Oxford training, is able sometimes to date his letters Maunday Thursday or Shrove Tuesday; but beyond that his acquaintance with ecclesiasticism does not go.

MR. GLADSTONE AS POPE.

Without carrying the parallel and contrast any further, what an interesting theme for imaginative contemplation is afforded us in the suggestion of what Mr. Gladstone might have been had he been called to Holy Orders, as his father at one time proposed! In the English Church he would have been cabined, cribbed and confined. To realize what might have been, we must suppose that the great cataclysm of the sixteenth century had never severed England from the Church of Rome, and that Mr. Gladstone, instead of being Prime Minister of England, had been called to be Pope. He would have made a very good Pope, although, possibly, a little too nimble in his career for the cumbrous and gigantic machinery of Catholicism. But how he would have enjoyed it! How he would have revelled in the hoarded treasures of the Vatican library, and delighted in the endless services of the Roman Church. Where in all the world would he have found so wide a field for the exercise of his wonderfully subtle gifts of making distinctions. Where could he have been able to find such opportunities for explaining away awkward facts and demonstrating triumphantly the absolute truth of two diametrically opposite propositions? And then his Encyclicals! We have had them already—the letter on the Neapolitan prisons, the pamphlet on the Bulgarian atrocities, the article on Vaticanism—were all utterances of the genuine pontifical kind, which had at least as much power and influence as any Bulls which Rome ever forged. But if only Mr. Gladstone had sat in Pope Leo's chair and worn the three-crowned hat!

HIS SPIRITUAL AND TEMPORAL POWER.

All of which brings us to the observation that the position which Mr. Gladstone has so long held among us is much more that of an English Pope than merely that of an English Prime Minister. He is the head of the church for practical purposes, much more than the Archbishop of Canterbury, whom he made, or than the Queen, whose ecclesiastical position is strictly ornamental. Mr. Gladstone's temporal power was nothing to his spiritual power. His temporal power, indeed, may be said to rest on his spiritual power. He can divest himself of the former. The latter will cleave to him while life lasts. He is the only man whose opinion on questions of righteousness weighs much with the masses of our people. He is, therefore, in a very real way the keeper of their consciences. That function he will retain in his retreat at Hawarden, and this spiritual power may yet be used as it was in 1876 to the confounding of those to whom he has handed over the responsibilities of temporal administration.

FAREWELL!

It is, however, impossible, alas! that his successors will have long to anticipate such embarrassing interventions of the oracle from Hawarden in the work which he has abandoned. Eighty-five years weigh heavy on our mortal frame, and the failure of

faculties necessary to active work is the sure precursor of a dissolution which cannot be long delayed. We are all familiar with the apologue of the man who made a covenant with Death that he should not die until he had been warned three times. The man lived long past threescore years, then he became blind and deaf and paralyzed, and at last death came. He protested: "You have never warned me." But Death replied: "My first messenger was named Deafness, my second Blindness and my third Paralysis. Now I am come myself." And the mortal died.

Before Cardinal Manning passed, a continually increasing hardness of hearing was the most significant symptom of the coming change. Mr. Gladstone's hearing and sight have been failing him for some time. Nor is it to be expected that the slackening of the chain of official labor will check, even if it does not expedite, the approach of that event which we all foreknow, but which none the less we all deplore.

II. THE EARL OF ROSEBERY.

The difficulties of the succession to the Liberal leadership have been reduced to a minimum by the natural logic of circumstances. Long ago, seeing the possibility of Sir William Harcourt's accession to the leadership, I remember discussing that menaced disaster with Lord Rosebery. He stoutly maintained that I was mistaken: that Sir William was the natural and most capable successor of Mr. Gladstone, and that it was ridiculous and most unjustifiable to put his, Lord Rosebery's, name forward as if he had a shadow of a right to precedence over Sir W. Harcourt. All the same, despite his disclaimers, I cherished the hope that England might be spared the ordeal of having Sir William as prime minister, and that Mr. Gladstone would be able to hold on long enough to make Lord Rosebery's succession certain.

It was fated so to be. The Grand Old Man did not retire until Lord Rosebery was ready to take his seat, and Sir William has acquiesced with more or less good grace in Lord Rosebery's accession. Lord Rosebery is not only Prime Minister in title—he is rightfully the first member in the Cabinet with authority and influence exceeding that of all his colleagues. And it is a matter for national gratitude that it is so.

THE COMING MAN.

For Lord Rosebery is the rising hope of the British democracy. He is the statesman who, more than any other Liberal minister, unites the imperial instinct with the social democratic aspiration. He has been Chairman of the London County Council; he has been Foreign Secretary; he is now Prime Minister. He is a Scot and a peer and a man of means. He is still in the prime of his life—quite a youth, as politicians count years—and, wonderful to relate, has never yet made an enemy. It is difficult to say whether he is more esteemed by the Radicals or by the Tories. By both he is regarded as a security of the first-class for the

LORD ROSEBERY SEVEN YEARS AGO. (See frontispiece for latest portrait.)

safety of the Empire and the peace of Europe. I do not know another instance of a man so lavishly dowered with every advantage of rank, age, wealth, culture and opportunity, who has lived so actively and done so much without even exciting an envious enemy on either side of the House. He is a phenomenon, almost unique and as valuable as it is rare.

A MAN WITHOUT ENEMIES.

Mr. Labouchere, true to his part as the belittler of the Empire, rails at him—professionally. But Mr. Labouchere would be the first to admit that Lord Rosebery is a thorough good fellow, whom he would be only too glad to have on his own side, if it be that a Radical Scottish Imperialist could ever so far

change his skin as to become a little Englander of Cockayne. Excluding Mr. Labouchere, there is hardly a voice raised in criticism of the Liberal leader. From the Queen downward he is universally regarded as the right man in the right place. The Czar in the old days did not much like him, believing he was too friendly with the Bismarcks, but he has long ere this forgotten and forgiven the Batoum dispatch, while in every Chancellerie in Europe where peace is sought a report that Lord Rosebery had resigned would send a cold shiver down the diplomatic spine. Only in Paris would there be rejoicing, and naturally. For Paris is the only place in Europe where there are men who want war, and who chafe against the maintenance of the good understanding between England, Germany and Russia which constitutes a triple barrier against the war of revenge. The French appreciate Lord Rosebery's cool, unsleeping vigilance, his imperturbable vindication of British rights, and having a keen perception of his value to England, would naturally prefer to see his place vacant. It is the highest compliment they could pay him.

WHY NOT FOREIGN MINISTER STILL?

Lord Rosebery ought to be Foreign Minister still, but, according to the accepted doctrine of the Gladstonian, a Prime Minister must not be at the Foreign Office. The two offices must not be united. It is stuff and nonsense, although it is also Liberal

orthodoxy. Lord Salisbury united the two well enough and so could Lord Rosebery. The talk about the impossibility of one man being able to do the work of the double office is absurd. No doubt it is a strain. But the work of the Foreign Office is not such a strain either upon mind or nerves or physical strength as the task of leading the House of Commons. If this question were to be decided by the test of which imposed the least strain upon the Prime Minister's strength, no one can doubt for a moment that it would be decided in favor of the portfolio for foreign affairs and against the leadership of the Commons. It might no doubt be better if you could have a Prime Minister who was neither Foreign Secretary nor leader of the Commons. But if he must be one or the other, he

had very much better be as Lord Salisbury than as Mr. Gladstone so far as the question is left to the test of physical exhaustion. Mr. Gladstone, however, thought otherwise, and his dogma will continue for a few months to dominate his party. After another term of the Salisbury combination, it will probably be discovered that the Gladstonian dogma was not an ex-cathedra utterance, but merely a pious opinion in no way binding upon the consciences of the true believers.

THE ADVANTAGE OF BEING A PEER.

A preposterous theory has obtained some currency among those who call themselves Radicals, but who

From a photograph taken at Eaton.

IN HIS SCHOOL-BOY PERIOD.

in reality are mere victims of social jealousy, that it would never do for the Radical party to have its leader seated in the House of Lords. This is class prejudice in an absurd although inverted form. The old aristocrats used to deny the right of any man to be Minister of the Crown unless he were of noble blood. The new democrats would with equal unreason and exclusiveness deny the right of any man to be Prime Minister if he happened to belong to the Peerage. Surely the day for such nonsense is far past. A title which did not prevent Lord Rosebery sitting in the chair of the County Council ought not to disqualify him from being Prime Minister of the Crown. The fact that the House of Commons is the centre and the seat of authority does not demand the presence of the Premier in its midst. The authority of the Premier when the Premier is as capable as Lord Salisbury or Lord Rosebery prevails, though neither of them sits in the House of Commons, not because they are peers, but because they have the con-

fidence of the majority of the Commons. The place where they sit is immaterial so far as the recognition of the authority of the Commons is concerned. The only question is as to the comparative advantages of the two houses as the seat of the Premier. The feeling is growing in the country, a feeling based upon the experience afforded by the hopelessly crowded condition of the order book of the Commons and the exhausting strain which the leadership entails on its chief, that, even if the House of Lords had not existed, it might have been necessary to invent it, if only to afford a place for Prime Ministers to enjoy a respite from endless worry and debate. The only advantage which a seat in the Lords confers is that it disqualifies for a seat in the House of Commons, and that, from our present point of view, is an almost incalculable boon.

HIS DISLIKE OF THE UPPER CHAMBER.

Lord Rosebery, I know, is of a different opinion. He would gladly exchange many of his titular honors for the opportunity of mingling in the fray in the arena where the destinies of parties are decided. His active and militant spirit chafes against the aristocratic frigidarium in which he and his twoscore followers are imprisoned amid ten times their number of Unionists. Ten to one is too heavy odds for fair fighting. But we are all as apt to rebel against the limitations of our lot, which are, after all, the secret of our strength, and Lord Rosebery will probably live to bless God for the House of Lords, if only because it affords him a safe retreat from which he can undertake the government of the country. He is much too valuable, and in one sense too frail an asset to be allowed to risk his health and life by venturing into the gladiatorial fray of the lower house.

MORE THAN PREMIER.

Lord Rosebery's position in the Cabinet is very strong. It is understood that upon all questions relating to England over sea Lord Rosebery is to have the support of Sir W. Harcourt. This is good news for the Empire, but bad news, very bad news, for Mr. Labouchere and those Englishmen who spend their lives in a vain attempt to argue their fellow countrymen into believing they ought to be ashamed of their country and all the appurtenances thereof. For it means that Lord Rosebery has clinched the nail which he drove into the coffin of the old Manchester policy when he made his memorable fight about Uganda. Henceforth, so far as the Liberal party is concerned, there is no such policy as scuttle.

TRIED AND NOT FOUND WANTING.

As this is a matter of the very first importance to all Englishmen and Britons beyond the sea, it is as well to recall for a moment the incident which convinced all of us that Lord Rosebery is a lad of mettle who can be relied upon to hold the pass. Two or three years ago we used to say that Rosebery seemed to promise very well, but that everything had gone well with him. Never speak confidently of a man until you have seen him in a tight place, is a good

maxim, and acting upon it, judgment was suspended in the case of Lord Rosebery. But it is suspended no longer. When the Liberal administration was formed Lord Rosebery absolutely refused to enter it. Infinite was the consternation of the Liberal members, frank the dismay of the Court and of the outgoing Cabinet. But Lord Rosebery was deaf to all solicitation. He was not going back to the Foreign Office, nor did he. Why he made this resolute refusal no one has ever quite been able to say. Possibly it was due more to a subtle instinct or an obscure premonition than to any reasoned conviction as to the true cause. At first people doubted it, and said that

saved, the country was safe, and the peace powers of Europe were reassured that there was to be no breach on the continuity of the pacific policy of Lord Salisbury.

THE TEST CASE OF UGANDA.

Lord Rosebery had not been many weeks in office before he made his colleagues understand that as he had yielded reluctantly to their demands for his presence in the Cabinet, it was now their turn to yield to his representations. Mr. Gladstone and other Liberals when in opposition had made more or less foolish declarations about Egypt. Parisians waited, gaping with open mouths, to see whether Mr. Glad-

CHRIST-CHURCH COLLEGE, OXFORD. (LORD ROSEBERY'S COLLEGE.)

"Rosebery was only foxing!" But when it began to appear that he really meant what he said, every one was aghast. There was more to-do made about his refusal to take office than about any other man in the last fifty years. Everybody, regardless of party or of station, implored him to consent to take an office which has been the goal of many ambitious statesmen. The Queen is said to have commanded. Diplomats entreated, colleagues and friends united with political opponents in insisting that he must take office. And still he would not. It seemed more difficult to make this young Scot accept office than to form a whole Cabinet. At last, no one knows exactly why or under what precise degree of pressure, Lord Rosebery gave way. He took office. A great sigh of relief was heard everywhere. The Ministry was

stone would scuttle from the Valley of the Nile. Impatient little Englanders growled indignantly that steps had not already been taken to haul down the Union Jack and withdraw the garrison. It was necessary to give these gentry an object lesson, but it was dangerous, or at least inconvenient, to raise the Egyptian question, even in order to show that it was not to be raised. Fortunately at this moment the Destinies furnished Lord Rosebery with the very opportunity that he needed. The time arrived when Ministers had to decide whether or not they should evacuate the Central African province of Uganda. Lord Rosebery saw, with his usual swift intuition, that even though Uganda itself might matter little, Uganda as an object lesson would be invaluable. It is, I believe, an open secret that with the exception

of Lord Rosebery every member of the Cabinet, Mr. Gladstone included, was against the retention of Uganda. Mr. Gladstone, Sir W. Harcourt and Mr. Morley were naturally opposed to such an extension of the vast responsibilities of Great Britain. They represent Matthew Arnold's world-weary Titan. They are very tired of the burden well nigh to be borne, and they were all for laying it down. But Lord Rosebery thought otherwise. To haul down the flag in Uganda would be universally regarded as marking the entry of the Cabinet upon that fatal *facilis descensus Averni*, from which there is no return. The policy of scuttle begun on Lake Uganda would be clamored for in the Valley of the Nile. "You have cleared out of Uganda, why not out of Egypt?" Lord Rosebery foresaw all that and took his stand calmly but decisively against the very first beginnings of the perilous policy of skedaddle. *Obsta principiis* is a sound maxim, and Lord Rosebery acted upon it. He insisted upon staying the evacuation upon which his colleagues were bent. He insisted upon the dispatch of Sir G. Portal to the locality for purposes of inquiry, and he staved off all question of retirement until his envoy—now unhappily dead—made his report. His colleagues were indignant, Lord Rosebery was inexorable. If they must evacuate Uganda, of course Uganda must be evacuated. But so in that case would be the Foreign Office. His life would not be worth living as Foreign Secretary if the white flag was run up to the masthead and a policy of skedaddle inaugurated. It was a rare tight place for Lord Rose-

bery. But he proved himself a lad of wax, he stuck to his point and to his post, and at the end of the struggle Mr. Gladstone gave in, the Cabinet opposition collapsed, and Lord Rosebery had his way. Since then the word scuttle has not been heard once, nor have any people at home or abroad doubted that Lord Rosebery in foreign affairs is supreme.

AT THE FOREIGN OFFICE.

Since then things have gone very smoothly at the Foreign Office. The only trouble has been with France. But France is the troubler of Israel, and there never would be peace and tranquility in the world if it depended upon our restless neighbor. For twenty years after Sedan there was a lull, because France had not recovered from the prostration of the war. Since then France has shown an increasing disposition to assert herself wherever and whenever she could find an opportunity. This is natural enough, but it is awkward, and may be dangerous. Lord Rosebery handled the Siamese difficulty with discretion and reserve. The details of that business are not yet public property. But as the French government has kept within bounds, and the French Chauvinistic press was very mad against him, it may be assumed that he did his duty and did it well. The result of the Behring's Sea arbitration in Paris was one of the good fortunes of his administration of foreign affairs. On the whole, Lord Rosebery as Foreign Minister has been successful in a number of little troublesome controversies, which, if they had been less skillfully handled, might have been no

DALMENY : LORD ROSEBERY'S SCOTTISH HOME.

THE DURDANS : LORD ROSEBERY'S HOME AT EPSOM.

longer little. He has vindicated his reputation for good sense, caution and resolution. He has never trailed the flag, nor has he ever flaunted it music hall fashion. He has made every one feel that he was proud of his country, and resolute and able both to defend her interests and to fulfill her obligations. This is no small achievement when it is borne in mind that at least one-half of the disturbers of the world and peace had flattered themselves that Mr. Gladstone's administration would inaugurate a policy of general stampede.

A TRUSTED COUNSELOR OF KING DEMOS.

Lord Rosebery, however successful as Foreign Secretary, is not less remarkable for his keen appreciation of the forces that are factors in the evolution of our social democracy. His experience in the chair of the London County Council was an invaluable training to the future Prime Minister. It was an apprenticeship in practical democracy which no university could have supplied. Probably no other means could have been employed which would have brought the reserved and sensitive patrician into such free, unrestrained and fraternal relations with men like John Burns and Mr. McDougall. London is the heart of the Empire. London's problems are the problems of the civilized world in their acutest shape. London County Council represents the latest and most approved method in which Democracy seeks the solution

of these problems. Lord Rosebery was chairman and is still a member of that Council. Aristocrat as he is by birth and temperament, Lord Rosebery is a democrat at heart. His sympathies, little as he speaks about them, are with the people individually and collectively. He is no professional philanthropist who would feed the masses with Blue Books and Biscuit. There is in him a healthy human appreciation of fundamental human wants and an honest desire to see that they are supplied. Hence he is everywhere in touch with every one to an extent which is almost inconceivable when we remember his extreme sensitiveness and his almost morbid shrinking from confidences.

HIS ACTION IN THE MINERS' STRIKE.

The service which he rendered the community last winter when he was able to bring to a conclusion the most unfortunate dispute that ever paralyzed a nation's industry, was a notable tribute to the universal respect which his uprightness and sagacity had inspired. Mr. Gladstone might possibly have commanded the support of the miners; he would hardly have been trusted by their employers. Lord Rosebery was probably almost the only man in England who could have done what he did. The existence of such a public man in whom the public have such confidence is one of the great sources of national strength and of social stability. That is a truth which I appreciate

much more after spending a few months in Chicago than I was able to do before I crossed the Atlantic. Implicit confidence in the disinterested honesty and transparent sincerity of public men is not exactly the characteristic note of American politics. But alas for the nation or for the society which has lost faith in its leaders, and distrusts the men whom it is compelled to trust with its affairs.

HIS SPEECHES.

Lord Rosebery has a pleasant wit and a genial Scottish humor which makes him a universal favorite as a speaker. He does not speak much, never outstays his welcome and always leaves his audience in a good humor with themselves and with him. The laughter which illuminates his speeches never degenerates into mere purposeless hilarity. He uses his jokes to illustrate his arguments, not merely to set the table in a roar. There is also a subacidity about his humor which in a more gloomy mind might degenerate into the saturnine, but which in his case only lends a more piquant flavor to his speech. He is frank with himself first of all and as frank with his audience as possible under the circumstances. Of this his speech on the second reading of the Home Rule bill, last session, was a notable case in point. Lord Rosebery knew not only that the bill was doomed, but that he would have despised the Peers even more than he does now if they had voted against their convictions in favor of a bill which they loathed and dreaded. So he got out of the difficulty by making a most ingenuous speech which amused and enchanted everybody, and did not commit him to a single sentiment that was strained and unreal. Another notable speech of his was that in which he delivered the County Council from the folly which it was meditating in the shape of a costly and extravagant Hotel de Ville. That speech was a very remarkable illustration of the value of the respect which the democracy is not ashamed to pay to honest counsel even when it comes from the mouth of a peer. In the County Council chamber, King Demos only recognized his counselors as citizens. Sometimes when Radicals have escaped from the reaction against snobbery or feudalism gone rotten they will be equally democratic at St. Stephen's.

HIS ESTATES.

Lord Rosebery is a landowner in five counties, and he has residences in three, not including his well-known place in Berkeley Square. The Durdans, Mentmore and Dalmeny have each their charms, but unfortunately not even Lord Rosebery can be in three places at one time, and he discharges as best he can the duties of resident magistrate in Surrey, in Bucks and in Midlothian. Mentmore came to him by the marriage which gave him a conjugal connection with the new Canaan which the Rothschilds have founded for themselves in Hampden's country. At Dalmeny his foot is on his native heath, all Edinbro lies at his back door, while in front there is spread out before him the vast expanse of the gray Northern Sea.

HIS AUTHORSHIP.

As a writer Lord Rosebery has only published one book. His sketch of Pitt is an admirable specimen of the best English of our time. It is terse, bright, vivid and entertaining. There is perhaps here and there a little straining after the epigrammatic, and no wand then faint echoes of Macaulay's resonant cymbal may be caught in his pages. But the book is good stuff, well put together. The subject was a congenial one. A study of a Prime Minister of the Eighteenth Century by the Prime Minister of the Twentieth could hardly fail to be attractive. Such literary aptitude and historical insight as Lord Rosebery possesses are not likely to be exhausted in writing dispatches. In the approaching period of leisure I hope that Lord Rosebery will resume his pen and give us a fresh contribution to the education of the democracy in the origins of our Imperial heritage.

BEHIND THE SHIELD OF RESERVE.

Lord Rosebery is a man who represents the power of reserve and of self-restraint. Mr. Gladstone is the very opposite. Mr. Gladstone wears his heart upon his sleeve, and makes manifest his likes and dislikes to all the world in a wonderful multitude of methods. Lord Rosebery keeps his likes and dislikes to himself, is shy, reserved and reticent. This is partly due to an excessive sensitiveness which causes him to shrink from the rude shocks and jars which tough pachyderms bear with unruffled composure, and partly to constitutional reserve. Lord Rosebery has traveled much. He has made the tour of the world, and he has studied men and things in many places and under many skies. Everywhere he gave the impression of a kindly, silent, cultivated gentleman, with a quick smile and a shrewd eye. Few of these casual acquaintances of travel have any idea of the *perfervidum genium Scotorum* which lies beneath that impenetrable exterior, nor how stout and strong is the resolution within. But Bismarck knew it and respected it. France knows it and dislikes it. Another latent quality of his is the power of prodigious and incessant work.

HIS BEST CHARACTERISTIC.

The best characteristic of Lord Rosebery is the least known and it is one of which I hesitate to write. It would, however, be a wrong to the public to refrain from calling attention to the fact that although Lord Rosebery does not read lessons in his parish church, he is as much dominated by the religious instinct as Mr. Gladstone himself. No one is more conscientious among lay or clerical statesmen of our day. No one, not even Mr. Gladstone himself, scrutinizes more closely the moral aspects of all his policies and all his acts. No one would claim Lord Rosebery as one of the conventional ecclesiastical Christians of his day. But so far as fearing God and working righteousness goes there are few who dwell so much in their Taskmaster's eye as the young peer upon whom has descended the mantle of Mr. Gladstone.

III. SIR WILLIAM HARCOURT.

Sir William Harcourt will, of course, lead the House of Commons in the place of Mr. Gladstone. He has deserved the promotion. During Mr. Gladstone's absence he has acted as his substitute. And he will now have the sole and undisputed responsibility for the remainder of the session. Some of the

capacity is a singular tribute to his success at the Home Office, and perhaps not less to the unpopularity of Sir W. Harcourt.

A much better leader of the House than Sir William would be Mr. Campbell Bannerman, who is a very much cleverer W. H. Smith. But Mr. Campbell Bannerman has no ambitions and Sir William Harcourt has. Besides, Sir W. Harcourt is virtu-

ally in the saddle, and although there are plenty who would gladly see him anywhere else, there are no Liberals who would risk shattering their party by getting up a cabal about a matter of such small moment as to whether Sir William or another shall for the next few months lead the party down a dolorous way of hardship and misfortune to the inevitable dissolution. The Liberal majority, said Mr. Bryce, when the Ministry was formed, is a little one, but it is a fighter. It is smaller now and its leader is gone, and it will have to fight *volens volens* until it disappears. That it will disappear when the signal is given for the dissolution seems to be almost certain. Apart from the great law of swing-swang which has operated with unswerving regularity for nearly thirty years, the chances are all in favor of the election of a Unionist majority. The Liberals have lost their King Arthur. The Irish show no signs of reunion. The Unionists are cementing their alliance. They will go to the counties full of confidence, fresh from a victorious campaign waged against a parliamentary majority, and will appeal to the English constituencies to rally round the party and the Peers, which for almost the first time represents a majority of the English electorate. The Liberals will fight, of course, and do their best, but

unless something unforeseen happens they will be beaten before the polls open.

THE HOPE FOR HOME RULE.

All our hopes for the immediate future rest upon the degree of success which we can achieve in convincing the Unionists that their true party policy is to give the Irish a system of local self-government so radical and so practical that the Irish may be able to accept it as an installment, and under protest, no

SIR WILLIAM VERNON HARCOURT.

American papers, I see, have been suggesting that Mr. Asquith was a possible leader. No doubt this is true, if we can draw upon the future indefinitely. Mr. Gladstone can remember when he first saw Lord Salisbury, and he can never forget that he was then a bright, chubby-faced boy in red frocks. That red-frocked urchin was a possible Prime Minister. But it took time. So it will take time before Mr. Asquith can hope to lead the House. That he should be thought of even by American journalists in that

doubt, but still that they may be able to accept it. The Unionists—who this time will have Mr. Chamberlain in the Cabinet—are pledged to introduce a local government bill for Ireland. If they make it a good one Ireland will get nearer Home Rule through Lord Salisbury's government than she could do by any other road short of a great popular uprising that will smash the Peers. There seems little likelihood of

SIR WILLIAM IN THE HOUSE OF COMMONS.

any such popular uprising. Therefore the chance for Home Rule next Parliament is to have a Unionist Ministry weak enough to need support from the Irish, but strong enough to call their Home Rule bill, a bill for the better development of local self-government in Ireland. They will not, could not, and dare not pass a Home Rule bill. But unless all precedents are awry they will pass a measure which will be Home Rule in germ and Home Rule in all but in name.

The outlook, therefore, is cheerful enough for all excepting office seekers. The Liberals will once more go out of office only in order to see their principles carried into effect by their opponents. As it was with Catholic emancipation, with the corn laws, with Jewish emancipation, with household suffrage, with the establishment of county councils and the introduction of free education, so now, as relative to Home

Rule, the defeat of the Liberals will be the immediate precursor of the triumph of Liberal principles. There is nothing strange or farfetched about this. Mr. Balfour is publicly committed to a local government bill for Ireland. He took his own measure seriously despite the laughter with which it was received. He will be certain to go one better next time he has a chance. Mr. Chamberlain will be in the Cabinet, and he will not lose such an opportunity of showing how faithful he is to his old Radical convictions. On the whole, therefore, the prospect of Home Rule is reassuring, and we may contemplate the immediate future with some considerable complacency.

SIR WILLIAM AND MR. WILLIAM.

It is no doubt this comforting conviction of the probable advent of a Unionist administration pledged to progress in the direction of Irish self-government that enables us to contemplate with more equanimity than would otherwise have been possible the leadership of Sir W. Harcourt in the House of Commons. It is but for a little time and the period of our tribulation will soon be overpast. We cannot pretend to regard Sir W. Harcourt's elevation as anything but a misfortune. For Sir William Harcourt possesses all of the qualities which Mr. William Gladstone has taught us to disregard. He is singularly lacking in those higher gifts which made Mr. Gladstone a national hero. To say that Mr. Gladstone believes in everything and Sir W. Harcourt believes in nothing would be too sweeping an assertion, but it has a semblance of truth. It would not be true, for Sir W. Harcourt undoubtedly believes in one thing—himself, to wit—but for other causes he is singularly devoid of the enthusiasm which is the supreme characteristic of Mr. Gladstone. It is curious that the party of all the enthusiasms should now be led by a politician with none.

A MAN WITHOUT ENTHUSIASMS.

Mr. Labouchere long ago used to say that Sir W. Harcourt was an ideal leader for the Radicals, because he had no nonsense in him about leadership. He would do as he was told, pursue the cult of the jumping cat, and as for the Radicals, they would call upon him every day after breakfast to give him his orders. Mr. Labouchere is always amusing, but sometimes his acidulated exaggerations embody a popular belief. Rightly or wrongly, it is accepted almost universally that Sir W. Harcourt is a mere Dugald Dalgetty, a powerful fighting man who regards political life as a series of campaigns in which the wise man takes sides according to an enlightened sense of self-interest. They may be doing Sir William Harcourt a cruel wrong. He may have the fervor of a Chrysostom, the self-renunciation of a St. Francis, or the zeal of a Loyola hidden beneath his ample waistcoat. There is room enough there, no doubt, and to spare. But if it is hidden, it is hidden so securely that none of his colleagues or contemporaries appears yet to have discovered it. The difference between him and his immediate predecessor is that Mr. Gladstone is so tre-

mendously in earnest that he can hear the trumpet of the Archangel in the phrasing of a schedule. Sir W. Harcourt would hardly believe seriously in anything, even though one rose from the dead. It may be that all this is a mistake; I hope it is. But it is none the less a misfortune that Sir W. Harcourt's record should have given ground for such a lamentable misinterpretation of his real nature.

THE ORIGIN OF POPULAR DISTRUST.

Sir William, then Mr. Vernon Harcourt, first rubbed Radicals the wrong way when he first entered Parliament. He posed as the intensely superior person, learned, cultured and epigrammatic. He first began to be known as a coming personality in English politics when the Gladstone Cabinet of 1869-74 was weakening to its fall. He lifted up his heel against

lain had not opened the way for his accession to the Liberal leadership.

SIR W. HARCOURT'S GOOD POINTS.

All this, however, is ancient history, and somewhat moldy and sour at that. Sir W. Harcourt has almost closed his career, but he has still a few months in which to round off his ambitions. It is pleasanter to look upon his good points and to note the qualities which have enabled him to overcome the prejudices which at one time seemed to place an insurmountable barrier in the way of his success.

To begin with, Sir William comes of ancient English stock. He is said to be descended from the Plantagenets. He was born in the purple, or rather the snowy lawn of the Anglican hierarchy. He was favored with the best education our universities

TRINITY COLLEGE, CAMBRIDGE. (SIR WILLIAM HARCOURT'S COLLEGE.)

the Government, sneered elaborately in a somewhat Disraelitish fashion against the Liberal chief and earned in consequence the abiding dislike and distrust of all who loved and were loyal to the Prime Minister. He seemed to have an idea in those days that there was an opening for a Liberal Disraeli, and was hated accordingly by all those to whom Disraeli was anathema maranatha. The impression he then created he has never been able to remove. He deepened it rather than otherwise by the way he used to talk of Mr. Gladstone during the Bulgarian agitation, even when he was making his most flamboyant speeches in his support. As Home Secretary he did not particularly distinguish himself, and when he offered to cast in his lot with Mr. Gladstone and Home Rule his enemies were not slow to find out that his decision would probably have been different if the secession of Lord Hartington and Mr. Chamber-

could impart. A gentleman by descent, a scholar and a lawyer and a university professor by training, he started in the race with many advantages, of which he had enough mother wit to make the most. There was in him also a certain would-be sympathy with the people which found expression early in his career in attempts to amend the law of conspiracy and to deliver the trade unionists from the tyrannously unjust laws by which they were shackled. These things would, however, have stood him in but little stead were it not that he possessed other talents which are in great demand in the parliamentary ranks. He had the great gift of humorous speech. The House of Commons dearly loves a laugh. As a stump orator he was almost unrivaled for his ability to provoke merriment, and the reports of his speeches were always more punctuated with "laughter" than those of any other occupant of the front bench. He stumbled

“MALWOOD:” SIR WILLIAM HARCOURT'S RESIDENCE IN THE NEW FOREST.

upon this precious gift early in his career and spent much of his spare time in developing it, in polishing his impromptu epigrams and carefully furbishing up the points of his unpremeditated jokes. But he was more than a mere humorist. He was a terribly hard hitter, a veritable slogger who hit out hard from the shoulder and landed heavily upon his opponent's face. In the rough and tumble of the demagogic arena, where most political reputations are made, Sir W. Harcourt soon achieved renown. At present no one can make so effective a speech to a crowd as Sir William—excepting Mr. Gladstone and Mr. Chamberlain—providing that he has time for preparation, and as he usually takes care that he has time, the proviso is not of much importance. In the House of Commons he is not so remarkable. Very few of his parliamentary efforts dwell in the memory of men. But we still remember gratefully the way in which he scorched the tinsel of Beaconsfieldism and shriveled up the false pretenses with which the Coercionists sought to evade the real issue of Home Rule.

A GOOD FIGHTER WHO WILL NOT FLINCH.

Sir William's chief virtue is that he is a hard fighter who can be relied upon not to bolt when the battle goes hard against him. He is a good comrade and a staunch ally. His colleagues say he is a good man to have at your back in a fight, and they ought to know. This loyalty to colleagues is due to English instinct rather than from any martyr-like devotion to a cause. Sir William is not the stuff of which martyrs are made. But he is very good stuff for a Tommy Atkins. He is faithful to his salt, and he does his duty as he is expected to do without making phrases about it. An American journalist who had considerable opportunities of observation told me the other day that Sir William seemed to him in many respects the most typical of English politicians. He was more of the type of John Bull, self-complacent, solidly expansive and not very idealistic.

A LITTLE ENGLANDER.

But of what contradictions are we not made? This typical John Bull is only known to be in advance of the general sentiment of the nation on one subject—that of prohibiting the sale of strong drink. This self-complacent Briton is always more or less sitting in dust and ashes over the melancholy spectacle of his country's vices. I sometimes feel as if after all it was not a very bad, at least not the worst, thing that Sir W. Harcourt should not be fanatically devoted to his own convictions. For some of them are very bad ideas of the worst little England school. If he were left to himself, it is to be feared that Sir William would be a little Englander of the Laboucherean type. He is a very poor Imperial-

ist. He would never have reconstructed the navy or have occupied Africa. Fortunately he will not be left to himself, which is well for the Empire, and it will be all the better if foreign powers are given to understand once for all that in matters beyond the sea the leader of the House of Commons does not really count for much as the leader of opposition. The only member who really counts is the present Prime Minister, Lord Rosebery.

AS LEADER OF THE HOUSE.

As a leader in the House Sir William Harcourt is not unpopular. He is a genial man, a ready speaker, and he has a pleasant wit. In the human relations of life he is exemplary. He is fond of country life, and delights to spend his time in the sylvan retreats of the New Forest. He is patriarchal in his household, not caring much to brook contradiction at his own table, but he is beloved by those of his own family, the affection of Lulu, for instance, being almost touching in its beautiful sincerity. On questions relating to women's rights he is as bad as Mr. Gladstone. From a political point of view he could hardly be worse, for the world moves after all, and Mr. Gladstone, whose last act before the general election was to commit himself needlessly against the recognition of woman's citizenship, has to count as his latest achievement the acceptance of the defeat forced upon him by the advocates of the enfranchisement of the sex in the Parish Council's bill. Sir William will not attempt to put the clock back; but neither will he attempt to put it forward.

WINDING UP THE CONCERN.

Of his success as temporary commander of the Liberal forces it is difficult to speak. A good lieutenant is sometimes a very poor captain. Sir Wm. Harcourt solus may be a very different person from Sir William plus Mr. Gladstone. But the chances are that Ministers will pull together as best they can until the dissolution, which every one anticipates will come in a few months. The majority elected to support Mr. Gladstone and to pass Home Rule can hardly be depended upon to remain together more than one session after Mr. Gladstone has gone and Home Rule been relegated to the new Parliament. All that Sir W. Harcourt can do is to try and keep his majority together and to pile up as heavy an indictment as possible against the House of Lords. He will find congenial work in satisfying the local optionists. The crux of the administration will be the budget. If he survives that ordeal and can succeed in conciliating sufficient Irish support there seems to be no reason why he should not round off his career by winding up decorously as Liberal leader in the Commons the work of the Gladstone Administration.

THE DRIFT IN AUSTRALASIAN POLITICS

NO. 1.—WHAT THE DELAYS IN FEDERATION HAVE TAUGHT THE PEOPLE.

BY SIR HENRY PARKES, G.C.M.G.

[The REVIEW OF REVIEWS is glad to announce that it has arranged for a series of special articles from the pens of the leading public men and thinkers of Australia and New Zealand, to be published under the general title of "The Drift in Australasian Politics." The series opens with the following brief paper on the Federation of the Australian Colonies, by the distinguished leader in the Union movement, Sir Henry Parkes. The articles that are to follow will cover a very wide range of timely topics.—EDITOR.]

SOME lessons of a valuable character may be learned from the delays in the progress of the cause of Australian Union. It has been made manifest that something more than the preaching of an apostle, or mere championship on the platform or in the senate, is indispensable to the advancement of the cause

thought, the higher aspirations, and the finer natures of the living generations, and is now leaping forward throughout the ranks of the Australian people. The open enemy, the masked assailant that lies in ambush, and the provincial unbeliever cry aloud with much rejoicing that there is no harvest, their distempered vision being too choked by the fungus growths of their narrow views to see the young grain springing up wherever there is fruitful soil to sustain it. This is shown far and wide by one popular fact, the incorporation of the word "federal" in the vocabulary of the people and its universal application to every fresh form of enterprise, every attractive social movement, every new organization, almost every sport and favorite amusement, while no like affinity has in any single instance manifested itself toward the cause of provincialism. As showing more indisputably the growth of national sentiment and the steady formation of a healthy Federal opinion, any argument in support of the cause needs but to be stated clearly and definitely before a public audience to bring out an approving response, the true ring of which can never be mistaken for partisan applause. Then, there is the homage paid to the transcendent greatness of the cause by its enemies, who, in hardly any instance, are daring enough to openly avow their hostility. If it is asked, What has produced the protraction of effort, the dissipation of energy, and the misuse of opportunities during 1892 and 1893? the answer is obvious enough—it is the paltering and insincerity of politicians in high places.

FORESEEN DELAY.

So far as the present writer is concerned, it seems no more than justice to say that in the early infancy of this agitation for complete Federal Government, he foresaw the probability of waste of time and delay. Addressing my constituents on November 6, 1889, after speaking of the magnitude of the work, I used these words: "All this might take time. It was not light work. It was not likely to be done in a day—it ought not to be done in a day. We wanted the question to be pondered by all classes. We wanted to hear all objections in order to meet them. We wanted to hear all adverse reasons in order to answer them. They did not seek to thrust this great thing on the public mind of Australia. They knew it required time; they knew that all consummations of similar magnitude had taken time." On the same

SIR HENRY PARKES.

beyond the academic stage. At the same time it has been made too clear for a blind man not to see that many tongues were let loose in the loud shout for Federation in 1890 and 1891, when the mind failed to form an adequate conception of the complicated vastness of the noble object to be achieved.

But while these results have come about, which are seized upon by the unthinking as proof of intuition, the federal flame has been taking hold of the nobler

occasion, referring to my own efforts, and urging that success did not depend on one man, or on any set of men, but upon the cause rooting itself in the hearts of the people. I am reported to have said: "But casting himself aside, or any one else who might be the chief instrument in this great movement, he said that the cause itself was safe; it might be delayed, but it could not be put back. It did not depend on any man who for the time being held executive office in any of these colonies. It depended on the intelligence and will of the people of these colonies."

Any cause of primal greatness in the affairs of mankind, though independent of contemporary conditions, is nevertheless subject to obstacles arising out of its very grandeur. Its largeness cannot be reached by small minds. The world is full of confirmations of this irrefragable and unmitigable truth, however unpalatable it may be. To the average Australian "public man," the idea of Australian union was big and irreducible, and could not be brought into harmony with the current of his political thoughts. But we may be thankful that all men are not "public men." The newness of the subject was against it with the typical voter and the typical candidate, and it could not be localized for use by the typical wire-puller. Hence we have heard from the meeting, or from the hotel balcony, that Mr. Blank was a strong advocate for Federation, but not on the lines of the bill, or on true democratic lines, or on lines suitable to the wants of the people; and we have seen Mr. Blank resume his seat quite satisfied with himself, and with marks of approval showered upon him, as if he had expounded a belief or had favored his audience with a profound definition. But all this time, as we have said, the roots of Union have been striking deeper and wider into the soil.

NEW MEN AND METHODS.

It is a little over four years since what may be called the "new movement" set in—since the agitation for a complete Federal Government, which the united people could mold into conformity with their own aspirations, was originated. In 1890 and 1891 there were men at the head of affairs in the three principal colonies who had definite views and, in different degrees, but with as much agreement as could be looked for, an earnest purpose in regard to Federation. No man of unprejudiced mind could doubt what Mr. Gillies, Sir Samuel Griffith, or the present writer aimed at through those two years. What was done is upon record, and the work surprised the world by its measure of success. Toward the end of 1891 a wild change had taken place, which, in New South Wales by the operation of adventitious circumstances, placed at the head of the Government and at the head of the Parliamentary Opposition, two men who had signalized themselves by their crooked and unscrupulous courses in opposing Federation. It would be difficult to determine which had become most conspicuous in frustrating the cause of union by perverse methods—George Dibbs or George Reid. It was now proclaimed that a gentleman who hitherto had bravely fought under the ban-

ner of Federation, Mr. Edmund Barton, would take charge of that cause as a member of the Anti-Federation Cabinet. Though the thing had a queer look, many persons, including the present writer, believed in Mr. Barton's sincerity, and looked for something being done by some mysterious process which we could not see. Eighteen months passed away without any substantial result from the Barton arrangement, when Mr. Barton, apparently losing faith in his own power as a member of the Dibbs Ministry, sought to repair the mischief by an ill-considered organization outside the Ministry. Another half-year has been added to the length of squandered time since Sir George Dibbs assumed office at the end of October, 1891, and the sham actors in the Federation comedy, under the Anti-Federation Premier, are very much where they were then. In the other colonies little more satisfactory has been done during this dreary period.

HOW VICTORY MUST BE WON.

Those of us who have eyes to see, and ears to hear, cannot fail to gain instruction from this discomforting past. We are taught that to lead in this, the greatest cause that has arisen in Australia, the man must be in the leading place; that he must be convinced of the nobility of the struggle, and possess the courage of his conviction. No captain can be accepted who is subject to the command of another who is adverse to the objects for which we fight. These decisions involve a recast of the creed of popular statesmanship in the several provinces. The shibboleth of provincial Free Trade, or provincial Protection must fall out of use, and political sympathies must expand beyond the separating borderlands. The oneness of Australian feeling must be fostered and cultivated. The platform for Victoria or New South Wales must embrace questions of wider scope and grander outline. The politician's mind must emancipate itself from local contractions, and master the principles of a high national life. In dealing with the question which is above all other questions, there must be no arrangement in the future to subordinate the greater to the less.

While we see the national idea healthily ripening, the germ of national life opening to the light of progress, we have enough of encouragement to justify the refusal of perfunctory service on the part of pretenders. None other is so dangerous as the half-hearted adherent in a just cause. We do not here pretend to advocate Federation, it does not seem to be necessary; but we urge the adoption of new methods in its advocacy. The union of Australia and the freedom of the sister states should be the watchword of the great Australian party in every electoral contest in every part of Australia, and a cause so sacred can only be intrusted to whole-hearted believers. The period of backsliding and desertion, of temporizing and paltering, of treachery and betrayal, has wrought lessons to us all, and all must profit by them in battling for the achievement and the future security of the Commonwealth.

VIEW OF TUSKEGEE SCHOOL GROUNDS.

NEGRO PROGRESS ON THE TUSKEGEE PLAN.

BY ALBERT SHAW.

A FEW weeks ago, in the heart of the black belt of Alabama,—a region in which the colored population is far in excess of the white, and in which the negro preponderance is constantly increasing,—there was assembled at Tuskegee a very remarkable gathering. It was an occasion fraught with vital significance; and it deserves to be known and understood both in the South and in the North, in order that sympathy and encouragement may be given to a more general movement upon the methods so successfully introduced at Tuskegee. The assembly to which we refer was the third Tuskegee Negro Conference, which met on the 21st of February. It was held under the auspices of the Tuskegee Normal and Industrial Institute. The attendants and participants were the negro farmers of that general region. Some of them came from long distances. They filed into Tuskegee in every conceivable sort of vehicle, many of them driving from homes thirty, forty, or even fifty miles away. Fifteen Alabama counties were represented by the more progressive elements of the colored race,—a few ministers, some mechanics, and a considerable sprinkling of colored school teachers mingling with the much larger body of tillers of the rich but not very perfectly cultivated soil of that productive region.

The call to this Conference, as to its predecessors of 1892 and 1893, was issued by Mr. Booker T. Washington, principal of the Tuskegee Institute—a colored

man who deserves to be ranked not merely with the best and truest leaders of his own race in this country, but with our most skillful and successful educational organizers and managers, regardless of race. The late General Armstrong, whose magnificent work for the industrial and intellectual training of young Indians and young negroes at Hampton, Virginia, has left so permanent an impress, was heard to say more than once in his last years that if Hampton had done nothing else worthy of praise, he should have felt that his years of devotion to that undertaking would have been fully repaid in the training and commissioning of so remarkable and useful a man as Booker T. Washington. Young Washington was a colored lad of Virginian antecedents, who found his way to Hampton under the most forlorn conditions and in a state of absolute poverty. He developed rapidly under the inspiring influences of that school, and gave evidence of capacity so great, of prudence and judgment so marked, and of character so high and trustworthy, that General Armstrong and his associates felt no hesitancy in commending the untested young graduate for the post of principal of the new training school it was proposed to found upon the Hampton model in central Alabama, in the midst of a dense population of plantation negroes. Mr. Washington and other Hampton graduates, devoting their lives to the best interests of their own race, founded the Tuskegee School in 1881. It has from

that time until now been wholly in the hands of colored teachers. It began with one teacher and thirty students in a dilapidated old church and an adjacent shanty. It has now about forty resident teachers and officers, and a total enrollment of from nine hundred to a thousand pupils. It has 1,440 acres of land and some fifteen buildings, eight or ten of which are commodious and modern. Its property, at the low prices prevailing in the region, is valued at not far from \$150,000. Such is the bare statistical record of a growth that has been achieved in a little more than a decade. But the Tuskegee School is important not so much by reason of its large number of students and its acquisition of a working educational plant, as by reason of the precise kind of education it gives and the positive character of its influence upon the region over which its beacon light begins to shine with increasing brightness.

Tuskegee has a broad conception of its mission. It is not planted in Central Alabama in order to culti-

A TEACHER'S COTTAGE—BUILT BY THE STUDENTS.

to carry to young plantation negroes in Alabama is the old-fashioned curriculum of the smaller New England college of twenty-five years ago. The Tuskegee School has no desire to educate young negroes away from sympathy with the masses of their own race, nor to spoil them for the practical work that their own region has to offer them. On the other hand, the Tuskegee School is no fomenter of race discords and has no sympathy with the idea of the regeneration of the negro race through politics. It believes in the essential unity of interests of all the population of the South, and seeks to cultivate and perpetuate respect, confidence and mutual good will between the black and white races.

With so much of preface as to the deserved centrality of influence which the Tuskegee School has secured in all the matters that make for the well-being and progress of the colored people of Alabama's black belt, it may be permissible to return to the topic of the recent Conference, and then to make some further remarks as to the school itself, its methods and results. The following sentences made up the call which Mr. Washington sent out early in the present year for the recent Conference, and they throw light at once upon the spirit in which the gathering was conceived, and the practical ends it had in view:

The negro Conference held at Tuskegee, Alabama, the last two years, under the auspices of the Tuskegee Normal and Industrial Institute, have proved so helpful and instructive in showing the masses of colored people how to lift themselves up in their industrial, educational, moral and religious life, and have created so much general interest throughout the country, that it has been decided to hold another session of this Conference, Wednesday, February 21, 1894.

The aim will be, as in the two previous years, to bring together for a quiet Conference, not the politicians, but the representatives of the common, hard-working farmers and mechanics—the bone and sinew of the negro race—and ministers and teachers.

Two objects will be kept in view—1st, to find out from the people *themselves*, the facts as to their condition and get their ideas as to the remedies for present evils,—2nd, to get information as to how the young men and women now being educated can best use their education in helping the masses.

BOOKER T. WASHINGTON.

vate in the minds of a carefully secluded lot of young negroes the delusive idea that a smattering of Latin, Greek, trigonometry and psychology,—added to a very imperfect knowledge of the rudimentary branches,—can win the battle of life for the colored man in America, either as an individual or as a race. Nothing is more remote from the spirit and methods of Tuskegee than the absurd notion that the thing

DELEGATES ENTERING CONFERENCE HALL.

HOW THE DELEGATES CAME TO THE CONFERENCE.

SCENES AT THE THIRD TUSKEGEE NEGRO CONFERENCE, TUSKEGEE, ALA.,
FEBRUARY 21, 1984.

At the last Conference there were nearly 800 representatives present and a large number gave encouraging evidence of how, as a result of the previous meetings, homes had been secured, school houses built, school terms extended and the moral life of the people bettered.

In view of the economy which the people have been forced to practice during the last two years, owing to poor crops and low prices of cotton, this Conference will present an excellent medium through which to teach permanent economy and thrift.

It is planned to devote a portion of the session of this Conference to a Woman's Conference.

On Thursday, February 22, the day following the Conference, there will be a meeting of the officers and teachers of the colored schools in the South, who may be at the Conference, for the purpose of comparing views and taking advantage of lessons that may have been gotten from the Conference the previous day.

It is believed that such a meeting of the workers for the elevation of the negro, held in the Black Belt, with the lessons and impressions of the direct contact with the masses of colored people the previous day fresh before them, can only result in much practical good to the cause of negro education.

Aside from the work to be done in the South in an educational and moral sense, there can be no permanent prosperity till the whole industrial system (especially the "mortgage system") is revolutionized and put on a right basis, and there can be no better way to bring about the desired result than through such organizations as this negro Conference.

Thrift, continuous industry, and a sense of responsibility are what the plantation negroes most need to learn; and it would hardly be an exaggeration to say that the foremost object of the Tuskegee Institute is to inculcate these homely virtues. If most of the Tuskegee graduates and ex-students go out to become school teachers in the colored district schools of Alabama and adjoining States, it is not with the mere object of earning their wages by teaching the colored children to read and write. Each teacher regards it as his mission to further the prosperity and civilization of his race, by persuading the colored farmers to buy pieces of land rather than to rent; above all to shun the disastrous practice of mortgaging the crop long before it is harvested and sometimes even before it is planted; to abandon the tumble-down, one-room cabin, and to build decent houses of two rooms and an attic; to work steadily six days in the week, keeping fewer holidays and making fewer errands to town; to raise a greater variety of products, and to depend less upon the proceeds of a single crop. A further mission of these Tuskegee trained teachers is to persuade the district where they plant themselves to build a neat little schoolhouse instead of the decayed log cabin which still does service, as a rule, in the country districts of that section. The young women teachers occupy themselves much with a propaganda for cleanliness and good housekeeping among the mothers of families, and argue powerfully for the two-room house as against the one-room shanty. Mr. Booker Washington, out of the depths of much experience and knowledge of his race, would probably assent to the proposition that the adoption of two-room houses in place of one-room cabins by the plan-

tation negroes of the South would mean in the present generation ten times more for the real progress of the race in all that belongs to a true civilization, than the possession of the elective franchise. I confess that there is nothing in all the work done by Tuskegee that appeals more strongly to my sympathy or to my imagination as a friend of social reform, than this earnest propaganda for the two-room houses as a primary factor in moral and social progress. We have been accustomed to read of the horrors of life in one room in the crowded tenement districts of New York, London, Glasgow, and other great population centres, and most of us have been far less familiar with the idea that the one-room shanty of peasant populations is also an evil thing which must be superseded by better housing arrangements if there is to be any growth in refinement and civilization. A Hampton Institute teacher, Alice M. Bacon, who attended the recent Tuskegee Conference, remarks in a brief letter to the *Congregationalist*:

It was interesting to notice during the discussion how many changes were said to have taken place "since the last conference," or "since the first conference," the Tuskegee farmers' conference evidently furnishing an incentive to whole communities and a date from which events were to be reckoned. Many had been putting up schoolhouses since the last conference. So great a change in the matter of one-room cabins was noted as dating from the conference, that the original fraction used in the declaration that four-fifths of the people were still living in one-room cabins, was changed after the discussion to two-thirds as nearer the present state of affairs.

This percentage in the reduction of the one-room cabins throughout that great region under the influence of the Tuskegee Institute is a splendid and substantial result for which the highest praise is due. The negro is imitative and not without ambition; and the fashion having now been set, it may well be expected that the substitution of decent little homes for filthy hovels will go on at an accelerating pace. Unquestionably the reports at this year's conference will result during the coming twelvemonth in the building of many new homes. The manner of men who constitute the colored peasantry of central Alabama is described so interestingly by Miss Bacon that we are impelled to quote once more from her letter:

To persons who have worked in negro schools for years, and who think themselves fairly well acquainted with the characteristics, both mental and physical, of the race, this assemblage of Alabama cotton farmers is a revelation. One surprise comes in the great size of the men, the deep chests, the mighty muscles, the towering height, qualities which so many years ago represented so many thousand dollars' worth of property, but which to-day, if rightly directed, mean power to seize and to hold for themselves many of the benefits of American civilization.

When the conference sits down and begins its work a new surprise is in store. As one after another of these sons of Anak rises and gives his views of the subjects of everyday practical importance, for the study of which they have come together, the strong common sense, the quaint wit, the childlike simplicity and earnest thoughtfulness that characterize most of the speeches give to

the listeners a new idea of the intelligence of the plantation negro.

Surely Alabama need not despair of the future of a race so sinewy and so well disposed, if properly trained in habits of thrift and industry and brought under sound moral influences and restraints.

The resolutions which were adopted by the negro conference are abundantly worthy to be quoted in full. Their good sense and clear phraseology are equally remarkable. They are as follows :

We believe education, property and practical religion will eventually give us every right and privilege enjoyed by other citizens, and therefore that our interests can best be served by bending all our energies to securing them rather than by dwelling on the past or by fault-finding or complaining. We desire to make the Tuskegee Negro Conference a gauge of our progress from year to year in these things in the Black Belt.

1. With regard to education, it is still true that the average length of the country school is about three and a half months. There is either no schoolhouse or a very poor one, and the teacher, as a rule, is but little prepared for his work. We would suggest as remedies the raising of money by subscription, to lengthen the school term and to provide more and better schoolhouses. We would also urge upon our schools and colleges for the training of leaders the importance of sending more of their best men and women to the smaller towns and country districts.

2. As regards property, we find that four-fifths of our farmers still practice the habit of mortgaging their unplanted crops for the supplies furnished them, live on rented lands, are in debt, and two-thirds live in one-room cabins. As remedies we recommend the immediate purchase of land, its thorough cultivation, the raising of sufficient food supplies for home use, that we avoid the emigration agent, keep out of the cities, pay our taxes promptly, stop moving from farm to farm every year, work winters as well as summers, Saturdays as well as other days, practice every form of economy and especially avoid the expensive and injurious habit of using liquor, tobacco and snuff, and since our interests are one with the white people among whom we live, we would urge the cultivation, in every manly way, of friendship and good will toward them.

3. While in morals and religion we are far from what we ought to be, we yet note each year real improvement. To help us in this direction we urge a better preparation for the Christian ministry, the settlement of more of our differences outside of the courts; that we draw sharp lines between the virtuous and the immoral; that we refuse to tolerate wrongdoing in our leaders, especially in our ministers and teachers; that we treat our women with more respect and urge upon them the importance of

GIRLS' SEWING ROOM.

giving more time to their home life and less to the streets and public places.

In conclusion, the facts gathered from these three conferences warrant us in saying that each year education is increasing, more and more property is being acquired and gradually religion is becoming less a thing of the emotions and more a matter of upright living. We are glad to note a growing interest on the part of the best white people of the South in our progress.

In the afternoon of the same day there was a conference of negro women under the auspices of the woman's department of the Tuskegee Institute, the meeting being devoted to such subjects as the care of homes and of children. The *New Orleans Times-Democrat*, which reports in the most favorable and friendly way the main facts regarding the conference, says that there was a general consensus of opinion that the colored people of Alabama could not possibly better their condition by emigrating either to Africa or to any other portion of this country, and that there was general testimony as to the kind treatment received from the best class of white people. The lengthening of the school term is a subject that the Tuskegee Conferences have made conspicuous, and we are informed that the testimony shows some average improvement in this regard. In conclusion the *Times-Democrat* says: "Circulars got out by the Tuskegee school were given to each member of the conference, containing pictures of comfortable homes with directions for building. The teams were harnessed up and the farmers started home with hearty thanks and good-bys to Mr. Washington, and promises to go home and do the things they had learned."

This conference upon their practical affairs by these colored men of central Alabama was followed on the next day by a conference of teachers. There

were present many well known friends and promoters of colored education representing both the North and the South, besides a large number of the district school teachers who have been trained at Tuskegee. This conference was also pronounced a very valuable and interesting one.

There are two principal advantages in the large landed domain—1,440 acres—which the Tuskegee Institute has acquired. Nearly all of the students come to the school so poor that they are compelled to work their way through. The school farm affords employment for many of these pupils. On the other hand, it is an important part of the work of the school to teach thoroughly the art of practical agriculture. With nearly a thousand persons living in the school dormitories and cottages, many of the products of the farm and gardens can be utilized in the school kitchens. Moreover, a considerable area of land is desirable for the best success of the other practical trades and industries that go to make up the industrial side of life and instruction at such a school as Tuskegee. Thus it happens that one portion of the land affords extensive beds of clay, and the students have made all the bricks that have been used in the construction of several new school buildings, besides making brick for sale to outside purchasers. Most of the important buildings on the grounds have been built wholly by student labor, with the threefold result of good practical training in the several building trades, the giving of work to students who could not otherwise enjoy the advantages of the institution, and the eking out of the school's financial resources. Plastering, as well as brick-making and brick-laying, is practically and regularly taught. So large a farm makes it necessary to own horses and mules and agricultural implements, and this fact affords a basis for the maintenance of

a good shop for horse-shoeing and general blacksmithing—a shop patronized not only by the school farm itself, but by many outside farmers. Wheelwrighting also grows of necessity out of the making and care of the wagons and other vehicles of the farm; and the repair and painting of vehicles for many people in the country round about has resulted, as a testimony to the efficiency of the shop. The practical opportunity for instruction in carpentry is very considerable, where the barns and sheds and most of the more important school buildings have all been constructed by student labor, not to speak of a number of neat residences. A portion of the farm is heavily timbered and affords opportunity for instruction in sawmill work—while the output is at the same time utilized for the supply of materials for buildings, fences and so on. Harness-making, tinning, shoe-making and mattress-making are among the other trades taught, and carried on for the support of students and the profit of the institution. The young women are taught sewing, cooking, laundrying, and all other departments of housekeeping. The printing office is an important adjunct of the institution, and it turns out very creditable specimens of typographical work, doing a large amount of job printing for patrons outside of the institution, besides printing the college catalogues and one or two small journals conducted by the faculty and students.

The last number of the *Southern Letter*, a little monthly leaflet published by the Tuskegee school, contains the following editorial note, which will explain the practical nature of the industrial work carried on under Mr. Booker Washington's direction:

About two years ago, a friend of the school living in New York City gave \$10,000 with which to build and furnish Phelps Hall, to be used as a Bible Training School.

Instead of letting out the job by contract, it was taken in charge by the different departments, with Prof. J. H. Washington, General Superintendent of Industries, to oversee the whole. Bricks were made at the brick-yard, lumber at the sawmill, lath, shingles, brackets, moldings, window and door casings got ready, and all were made into the finished building. In the same way it was furnished, even to the mirrors. The work occupied nearly a year, and during that time the students, from the boys that dug the sand and carried the hod to the finest workmen, received \$10,000 worth of help in board, education and skill; yet the full value of the money remains in the building. A gentleman who learned of these facts said, "that \$10,000 was raised to \$20,000." This is a sample of the way all money given to Tuskegee is used.

BUILDING ERECTED AND VEHICLES MADE BY STUDENT LABOR.

STUDENTS LAYING BRICK.

If money is given to pay a teacher's salary, a part of it goes to nourish the student, for he raises and prepares the food the teacher eats, washes and mends and, often, makes his clothing, boots and shoes, and does whatever other work he may need done. Of about \$234,000 received by the school in twelve years, at least \$185,000 appears to-day on the school grounds, in the shape of permanent plant.

The climate of Alabama is said to be very favorable for bee culture, and this has been introduced on the Tuskegee farm with marked success. It is obvious that the institution can only gradually enter upon scientific experiments for the development of Alabama agriculture in new directions; but it can render very constant service by teaching the best methods of plain farming as regards the crops that belong by common consent to that soil and climate.

Some general information about the Tuskegee school as gleaned from the last catalogue may be of interest to our readers. The school continues in session through nine months, and expects its pupils to enter promptly at the beginning and to remain to the end of the session, although by special arrangements students are taken for periods as short as a single month. Tuition is free, the State of Alabama contributing three thousand dollars a year toward this object, and private individuals, largely Northern philanthropists, giving very considerable sums. The price of living at the school, which is uniform for all, is eight dollars per month—this including table board, room rent, fuel, lights, washing, mending of clothes, etc. All students are given an opportunity to work out from one-quarter to one-half of their expenses. In many cases arrangements are made by which students are permitted to work through the day and study in the night training school, thus accumulating

a credit which ultimately pays their way in the day school. It must be remembered that Tuskegee is not primarily a farm or a workshop, but a well-conducted school; and that study and class-room work are the principal tasks of the day, the industrial and farm work entering in as secondary, though not less intrinsically important, parts of the programme. The full course requires four years of study, in addition to a simple but thorough preparatory course, which the institution offers to those who have not received an equivalent preparatory training elsewhere. Students are informed that they will find it to their advantage not to purchase certain portions of their wardrobe before coming to the school, inasmuch as the girls' sewing room can supply them at about cost price. The school has adopted as a uniform for the young men a neat dark blue suit, this being furnished by the girls' sewing room at the bare cost of materials and manufacture. The expense for uniform is about thirteen dollars. Each student is required to wear the school's distinctive uniform cap. It is hardly necessary to explain that the wearing of a neat and tidy uniform has an excellent moral effect upon the young colored students. Moreover, military drill is a part of the regular *régime* of the school upon the ground that "it cultivates habits of order, neatness and unquestioning obedience, besides, the drill is a good physical training, promoting as it does a graceful and manly bearing." "Students are subjected to the drill, guard duty, and such other training as may be thought best. The battalion is divided into five companies which are officered by the students." The library has ten thousand volumes, to which additions are being made as constantly as possible, largely through the gifts of interested friends. The reading

THE TURNIP PATCH.

room is well supplied with journals and periodicals, and students are required to give items of current news every morning. No young man is allowed to leave the grounds without wearing his cap or some other identifying part of his uniform. He must carry with him the plain evidence of his connection with the institution, and must be on his good behavior accordingly.

It is not to be expected that the industrial departments of an institution like this should go far toward meeting current expenses. The growing work at Tuskegee is dependent upon the benevolence of the public to the extent of from fifty thousand to seventy-five thousand dollars a year. That Mr. Booker Washington has been able to secure such sums is evidence that those who have looked most carefully into the Tuskegee work are thoroughly convinced of its efficiency and importance. Its affairs are supervised by a board of twelve trustees and three Alabama State commissioners. It happens that at present the three State commissioners are also members of the board of trustees, which includes eight Southern and four Northern men. The four Northerners are Gen.

O. O. Howard, of the United States Army ; Rev. Dr. Gordon and Rev. C. F. Dole, of Boston, and Rev. R. C. Bedford, of Illinois. The school has the warm commendations of the best white citizens of Alabama, and has the strong moral support of such representatives of the Peabody fund, and other endowments for Southern education, as President Gilman, of the Johns Hopkins University, who has revisited it within the past month. The late General Armstrong said of Tuskegee : " It is, I think, the noblest and grandest work of any colored man in the land. What compares with it in genuine value and power for good ? It is on the Hampton plan, combining labor and study ; commands high respect from both races ; flies no denominational flag, but is thoroughly and earnestly Christian ; is out of debt, well managed and organized." Finally it was General Armstrong's plea that this school should have some regularly pledged factors in its annual support, and that the good people of the United States should unite to sustain Mr. Washington in his heavy undertaking, and fix forever a great light in the Black Belt of Alabama. Negro progress on these lines must be approved by every thoughtful mind.

STUDENTS GATHERING CANE.

A PEOPLE'S UNIVERSITY FOR SOUTHWEST LONDON :

THE BATTERSEA POLYTECHNIC INSTITUTE.

TAKE a map of London—one that shows the principal streets and chief railway lines—and look at the area which lies south of the river. The “silver streaming Thames” runs as softly to-day as it did when Spenser wrote his “Prothalamion,” but how different are its banks to what they were in the “spacious times of great Elizabeth.” Then they were

“ . . . painted all with variable flowers,
And all the meads adorn'd with dainty gems
Fit to deck maidens' bowers,
And crown their paramours.”

In the present year of grace they are marked by wharves, docks, piers, landing stages, warehouses, railway stations, and all else that is essential to the commerce of the greatest city of the greatest Empire in the world. This is as true of the south bank of the river at or in the neighborhood of Battersea, as of the better known portions near London Bridge, Wapping, Rotherhithe, Ratchiff or Shadwell. And the land lying south of the river at Battersea—how changed the picture which it presents upon the map

to-day from that which one may see in (say) Rocque's map of London, published in 1745. In place of the half dozen or more of heaths and commons which then existed, and of fields innumerable, we discern a labyrinthine network of streets, together with railway and tramway systems as perplexing as may be found anywhere upon the habitable globe. For Southwest London, as it is called, has almost as crowded a population as that of the East End. And this population, it may be observed, is for the most part exclusively English.

It has, we believe, been estimated that the three parishes of Battersea, Clapham and Wandsworth contain considerably more than a hundred and fifty thousand people within their borders. The heads of families in these parishes are mainly skilled artisans, clerks or laborers. They constitute beyond all question a very important community—one whose powers for good and for evil in this vast metropolis are very considerable. What has been done to educate them? What measures have been taken to train them to use

BATTERSEA POLYTECHNIC.

worthily the powers which they possess? What steps have been taken to make them better workmen, worthier citizens, happier men? Until recently practically no steps have been taken.

Very different has been the fortune of the East End of London. Enthusiastic young graduates have from time to time gone thither to lecture to the people concerning Greek tragedy, the philosophy of Plato, the painters of the Renaissance, or the poetry of Dante; a popular novelist has discovered that Whitechapel, Bow and Stepney have the most romantic associations and has made their people live for us by the never-failing magic of his sympathetic pen. To that novelist is due an institution which, whatever its success may have been or may be, was boldly conceived and (at the beginning) rich in promise for the future. The East End possesses a People's Palace; but south of the river, in the thickly-populated districts of Battersea, Clapham and Wandsworth, where there live folks as deserving as any that are to be found east of Aldgate, there is not—or, rather, there has not been up to the present—any institution of the kind in existence.

But all that is now to be changed.

There was formed some time ago a body termed the South London Polytechnics Committee, which body, under the presidency of Mr. Evan Spicer, set to work to do for South London what Mr. Walter Besant and certain charitable corporations had done for the East End. Two years ago or more that committee dissolved, leaving its work to be continued by the governing body of the Battersea Polytechnic Institute, which included in its membership several well-known gentlemen nominated by the Committee of the South London Polytechnic Institutes, by the governing body of the City Parochial Charities Trust, by the London County Council, by the London School Board, and by "co-optation." This governing body at once began to form an institute which should provide technical and scientific education "with reference to the requirements of the district." Mr. Walter Besant's "school" in the original Palace of Delight, it may be remembered, "consisted of a great number of quite small rooms, fitted with desks, tables, and whatever else might be necessary. Some of these rooms were called music rooms, and were intended for instruction and practice on different instruments. Others were for painting, drawing, sculpture, modeling, wood carving, leather work, brass work, embroidery, lace work, and all manner of small arts." Similarly, the governing body of the Battersea Polytechnic made up their minds to provide workshops for various trades, as well as physical and chemical laboratories, photographic rooms, art rooms, music rooms, and numerous class rooms and lecture halls, and to arrange for instruction in Technology (including arts applicable to plumbing, carpentry, bricklaying, pattern making, mechanical and electrical engineering, and the chemical trades); in science generally, according to the regulations of the Science and Art Department; in art (including wood carving and metal chasing); in music; in com-

mercial subjects, and in subjects specially interesting to women. The governing body determined, moreover, to give accommodation for social work, for clubs and social rooms, to provide two gymnasia, refreshment and reading rooms, and to build a swimming bath and a great hall.

This was a large order—one which obviously necessitated a very respectable credit balance at the Insti-

MR. EDWIN TATE, OF THE GOVERNING BOARD.

tute's bankers. Vain would have been the untutored eloquence and the far-reaching influence of a John Burns, vain also the wide experience of a Mr. Henry Cunynghame, without money enough to build and support the Institute that had been planned. An appeal to the public for \$300,000 had accordingly to be made; and in response to that appeal more than \$250,000 had been obtained before the close of the autumn of 1891. At present some \$15,000 are required to complete the scheme, and to secure the handsome endowment of \$12,500 a year which the Charity Commissioners have promised toward the permanent support of the Institute. If that sum of \$15,000 be not forthcoming, the annual subsidy from the Commissioners will only amount to \$7,500. For this reason the governing body earnestly appeal to those who are interested in the social and educational welfare of the people to assist them in carrying out to its "fullest extent" the scheme which was prepared with so much care, and in erecting an Institute which in its design and construction shall make complete

THE ENTRANCE HALL.

provision for the social and educational wants of the vast population of South and Southwest London.

With a view to making the same "complete provision for the social and educational wants," etc., the governing body, some two or three years ago, acquired from Mr. Plunket, then Her Majesty's Commissioner of Works, as a site for the Institute, a piece of land of about two and a quarter acres in extent, formerly the property of the Albert Palace Association, whose luckless and deserted structure stands hard by the new building. Having thus got a site, as well as a cool two hundred and fifty thousand dollars, the committee looked around for an architect and builder who should between them construct the lordly edifice which they desired to put up. The architect whom they selected was Mr. E. W. Mountford, a Fellow of the Royal Institute of British Architects; while the builders whose tender turned out to be the lowest were Messrs. Holloway Brothers, a local firm held in high repute in Battersea and in the neighborhood. As the money in hand was not sufficient to carry out in its entirety the scheme proposed by Mr. Mountford, it was decided by the governing body to defer the erection of certain portions of the building, and thus bring the scheme within the means available. The raising of the Great Hall, and of sundry other structures, was therefore postponed for the time being. The Institute itself was, however, immediately begun, and is to-day an accomplished fact.

Those who have had occasion to ride along the Battersea Park Road in a tram car—cabs are few and far between in that vicinity—cannot fail to have noticed the imposing structure in brick and freestone that has gradually grown up near the Albert Palace. It consists, as far as the ground floor is concerned, of two blocks of buildings placed parallel to the Battersea Park Road, the front block occupying the whole southern side, and the back the whole of the northern side of the site. Shorter blocks at right angles to these form connecting links with each extremity and in the center, by which connections two spacious quadrangles are formed. Three large corridors suffice for the whole of the ground floor: the south, which is ten feet wide, runs the whole length (some 300 feet) of the front block; the north does the same for the rear block, while another corridor running north and south connects the two centrally.

Upon entering the Institute by way of the door facing the Battersea Park Road, a spacious hall rising through the two floors first attracts attention. The south corridor crosses at the back of this hall, and is here joined by the central corridor, the principal staircase rising from the point of junction. To the right of the entrance is to be found the administrative department—the secretary's office, the clerk's office, and the room set apart for the principal. At the left are numerous social rooms—a reading room, and a common room in which men who are members will be permitted to play draughts, bagatelle, etc., as well as to continue other pursuits of an equally harmless and edifying character. On this same floor are also gymnasia for both men and women, refreshment rooms, and lavatories. A swimming bath will be constructed here in due course, and a large hall for meetings, concerts, and the like ere long be built. At the back of the edifice and on the ground floor are the boiler room, the engine and dynamo room, and the engineers' workshop. For, be it noted, the Battersea Polytechnic intends above all things to consider the

THE GREAT HALL.

claims of those who are desirous of becoming engineers, especially electrical engineers. The authorities, therefore, deemed it advisable that the Institute should be lighted by electricity, and acting upon the suggestion of Professor Garnett, of the Durham College of Science, fitted up compound engines capable of giving one hundred horse-power, the exhaust steam of which will be utilized for heating the building. The engine room will, moreover, be fitted with a smaller engine, and with two dynamos and accumulators capable of supplying current enough to run 700 lights.

The whole of the first floor of the front block will be occupied by class rooms. Here things many and marvelous will be taught by day and in the evening; here sweet music will from time to time be discoursed (in rooms with double doors and with walls of extra thickness and special impenetrability to sound); here women students and members will have their class, club and reading rooms; here also will be drawing and electrical schools. On the second floor will be found a dozen or more of rooms for the use of those who are studying art and the science of chemistry. Laboratories and lecture theatres, studios (lighted from the north) and rooms for modeling, metal-chasing, wood-carving and photography occupy for the most part the available space at the top of the building.

With regard to the outside of the edifice, one may without any appreciable shock to one's artistic instincts admit that the architect has striven, not unsuccessfully, to bring some beauty of form and of color under the daily observation of the persons who from time to time use or pass by it. The style of the building is modern—"nineteenth century Renaissance" Mr. Mountford calls it. The walls are built of red Suffolk brick and bath stone, while the roofs are covered with red Broseley tiles. The chief ornamental features are ten statues representing Architecture, Sculpture, Painting and Engraving (these four are in the west gable); Poetry, and Music (these fill the two central gables); and Chemistry, Electricity, Mathematics, and Engineering (these adorn the east gable). The central hall is the only ornamented part of the interior of the building. This has an enriched plaster ceiling and a glass mosaic floor made in Battersea.

Such, briefly described, is the structure which the Prince of Wales formally opened on February 24. What do the quarter of a million of inhabitants who, we are assured, swarm in Southwest London propose to do with it? "The experience of existing institutes shows clearly"—we are quoting from an official report for 1892—"that the people will eagerly avail themselves of the benefits afforded by these Polytechnics." And they will probably do so in Battersea and the surrounding district. Judged from the point of view of applied science and of technology, the arrangements that are being made leave little to be desired. There will be a day school, which was opened on the 8th of January, at which a boy will have an opportunity of acquiring a thoroughly sound

and useful knowledge of applied science, while his general education will not be neglected. He will, for example, be trained in mathematics, and he will be taught French, English and drawing. The complete school course for day pupils will extend over the period of three years. The evening classes are intended, of course, to cover a considerably wider range of subjects, and are bound to be popular in a district which contains so many large firms of engineers, founders, chemists, candle and match manufacturers,

MR. SIDNEY H. WELLS, PRINCIPAL.

and builders. There are, moreover, to be special Saturday classes for teachers (men and women), each of which will be devoted to a lecture and to practical work in the laboratories, work rooms, and work shops.

The teaching staff which has been engaged would seem to be a very adequate one. The principal of the Institute (who, by the way, is alone responsible to the governing body) is Mr. Sidney H. Wells, a Whitworth scholar, who was trained at Maudslay's, and who subsequently taught engineering at Dulwich College and at the Yorkshire College, Leeds. Mr. Wells's assistants are Dr. Sumpner, Mr. S. H. Davies, B.Sc., and Mr. W. E. Walker. Mr. W. G. Thomas, formerly Head Master of the St. Thomas Charterhouse School of Art, will be in charge of the Art Department, and Dr. Ralph Dunstan in charge of that devoted to Music.

A NEW WORK ON MUNICIPAL FRANCHISES.

BY CARROLL D. WRIGHT.

THE title of this voluminous work,* which is the result of the great industry of Mr. Allen Ripley Foote, gives the impression that it is a work for lawyers, but an examination of its exceedingly interesting introductory chapters and of the table of contents soon leads to the conclusion that it is a work worthy to be read by all who care to understand the modern developments relative to municipal industries and those carried on under municipal franchises. Mr. Foote discusses with great clearness the economic law of labor and property, the resources of industry, the organization of industry and of municipalities, municipal needs and advantages, and various other topics wherein the intimate relation of statute law and provisions with economic elements is treated. The author says that it is the foundation for a systematic and sustained effort, undertaken in the interest of good government and the well-being of the people, to place the organization, management and control of public industrial corporations upon a true economic basis. In his discussion of the economic principles involved in legislation pertaining to incorporated companies operating under municipal franchises, the author brings out his fundamental ideas as follows :

1st. That the political groups into which society is subdivided for the purposes of government cannot exercise a greater intelligence than is expressed by the political action of the average voter.

2d. That the standards of economic morality by which the governing bodies of the various groups guide their action cannot be higher or truer than the standards by which business affairs are governed.

3d. That since men have not attained to that degree of development which justifies the assumption that they can be depended upon, on all occasions and under all circumstances, to do the right simply because it is right, they cannot be depended upon to be animated by true patriotism in dealing with public affairs.

Under such conditions the author believes that the first requirement of sound economy is to place public service corporations as nearly as possible on the same plane of advantage as the political group itself could attain by assuming ownership of undertakings, and that in consideration for such concessions the public must require a most exact accounting from such corporations and submission to a supervision that will unfailingly secure the fullest possible measure of the public welfare under all conditions and under all circumstances. By such means only those charged with the responsibility of representing and acting for the public can acquire the experience, knowledge of details and data which are absolutely necessary to enable them to supervise such corpora-

tions wisely, and by which they can serve the public well and satisfactorily.

The discussion in late years of whether water-works, gas and electric light works, and some other enterprises for the good of all citizens of a place can better be managed by the municipality than by incorporated companies makes this work of Mr. Foote's one of great interest and value at the present time. Those interested in the relations of labor and capital would do well to study its pages, to enable them to discuss and understand the infinite ramifications of the whole subject. Mr. Foote discusses the economic law of labor and property with intelligence, and draws the varying differences between moral law and economic law, but he believes fully, as do more and more people as enlightenment dawns upon them, that moral law is the foundation of economic law—that economic law simply completes moral law. For this reason the economic law of labor and property cannot be intelligently discussed without presupposing that moral law is understood and accepted as a binding obligation by which conduct is to be guided. This establishes the moral and economic principle that the natural rights of one man are equally the rights of all men. This is the very foundation of economic law. All virtuous habits that enhance the economic value of men develop character, and all vicious habits that impair the economic value of men degrade character. This is sound doctrine under the new school of economics, and is a wide departure from the teachings of the older economists, who believed that moral law had nothing whatever to do with economic law.

Mr. Foote advises the creation in the judicial branch of the State government of a department of municipal administration, to collect and publish statistics of the industrial companies and to be a court of equity wherein complaints may be considered, whether coming from the investors through the private corporation or from consumers through the municipal corporation. He recommends that all future franchises to gas, electric-light and street-car companies shall require the corporation to render uniform accounts and reports and to serve the public with the best methods commercially available ; that all consumers be treated alike ; that the corporate bonds or stocks represent actual investment, and that consumers be charged such rates as shall be fixed by the State from time to time, the rates collected to yield an income sufficient to provide for the payment of all fixed charges, expenses of administration, operation and maintenance, and a reasonable dividend per annum upon actual investment, and, finally, that any surplus remaining shall be divided equally between the municipality and the corporation, and a portion of that going to the corporation shall be divided between employees and investors. By this means, whereby publicity and the fixing of prices to consumers would be secured, Mr. Foote undertakes to solve the problem of municipal industrial corporations.

* The Law of Incorporated Companies operating under Municipal Franchises, such as illuminating gas companies, fuel gas companies, electrical central station companies, telephone companies, street railway companies, water companies, etc. By Allen Ripley Foote. LEADING ARTICLES OF THE MONTH.

THE ANTI-CATHOLIC CRUSADE.

DR. WASHINGTON GLADDEN makes a vigorous protest in the *Century* against what he terms "a most discouraging outbreak of religious rancor" in the very year of the World's Parliament of Religions. Dr. Gladden especially laments the appearance of such a movement at a time when "the occupant of the papal throne is perhaps the most enlightened and the most progressive pontiff who has ever occupied that throne: the whole policy of the Church under his administration has been tending toward a reconciliation with modern civilization, thus in effect reversing the tendencies of the preceding reign; the right of the people to govern themselves under republican forms has been distinctly affirmed by Pope Leo XIII; his deliverances upon the social question have manifested a large intelligence and quick human sympathy; and we are told by those who ought to know that the Pope is not alone in this liberalism—that he is heartily supported by the whole Curia and by public sentiment at Rome. This is the administration which the anti-Catholic zealots have chosen to attack: it is in the presence of these hopeful movements of the Roman ecclesiasticism that they are seeking to uncover the smoldering embers of religious animosity."

EXTENT OF THE MOVEMENT.

"Several secret orders are taking part in this crusade. Just now they are very strong in Ohio and in Michigan and in all the States further West. I learn that many of the local governments in eastern Michigan are in their possession; in some portions of Ohio they have been able to control municipal elections. In my own county, at the last election, every man but one upon the county ticket of one of the parties was reputed to be a member of one of these orders. It was also said, during the campaign, that a large proportion of the legislative candidates of one of the parties belonged to this order."

FORGERIES.

Dr. Gladden quotes certain documents, which, he says, have been widely circulated by these orders, and in which Cardinal Gibbons, Archbishop Ireland, and other American prelates are represented as "viewing with alarm" the spread of education and the rapid diffusion of the English language, and as urging the crowding out of American heretics from employment in every enterprise requiring labor. In another document, Pope Leo XIII is made to issue this astounding proclamation:

"We proclaim the people of the United States to have forfeited all right to rule said republic, and also all dominion, dignity and privileges appertaining to it. We likewise declare that all subjects of every rank and condition in the United States, and every

individual who has taken any oath of loyalty to the United States in any way whatever, may be absolved from said oath, as also from all duty, fidelity or obedience, on or about September 5, 1893, when the Roman Catholic Congress shall convene at Chicago, Ill., as we shall exonerate them from all engagements; and on or about the feast of Ignatius Loyola, in the year of our Lord 1893, *it will be the duty of the faithful to exterminate all heretics found within the jurisdiction of the United States.*

"This document has been published in many of the anti-Catholic newspapers; in some of them it has been kept standing week by week for months at a time; in leaflets and handbills of every form it has been distributed throughout the whole country."

"These transparent forgeries are taken seriously," says Dr. Gladden, "by tens of thousands of American voters. . . . When the ground has been well prepared by the dissemination of such dreadful documents and such harrowing tales the work of organization proceeds. The meeting places of these orders are intended to be secret; all their operations are carried on in the most stealthy manner. It will be readily seen, however, that a class of persons who could accept as genuine the documents which I have described would not be likely to preserve such secrets, and the existence and main purpose of these orders speedily transpire."

THE A. P. A.

"Chief among these anti-Catholic secret orders is the American Protective Association, better known by its initials. The platform of principles which this order publishes in the newspapers sounds well; most platforms do. It is not, however, always easy to find in its platform the animus of a political party; much less safe is it to accept those statements of its designs which a secret political society publishes in the newspapers. If its real purposes could be published in the newspapers there would appear to be no reason for secrecy."

"The platform of the A. P. A. makes these declarations: 'We attack no man's religion so long as he does not attempt to make his religion an element of political power.'

"'We are in favor of preserving constitutional liberty and maintaining the government of the United States.'

"'We regard all religio-political organizations as the enemies of civil and religious liberty.'"

OATH OF THE ORDER.

"This is the exoteric doctrine. The esoteric differs widely, as may be seen by comparing these statements with the oath taken at their initiation by all members of the order. This oath has been published in several places, having been derived, apparently,

from independent sources. Some verbal differences appear in these versions, but their substantial identity is conclusive evidence of their essential genuineness. The cardinal obligations of this oath are two: 1. A promise never to favor or aid the nomination, election or appointment of a Roman Catholic to any political office. 2. A promise never to employ a Roman Catholic in any capacity if the services of a Protestant can be obtained. The evidence that the oath of the order contains these two obligations is abundant and conclusive. Sane and reputable men, members of the order, in controversy with me upon the subject, have acknowledged this; and the challenge to men of known veracity to come forward and deny it has not been accepted. If the oath is not substantially as published, such a denial would violate no obligation.

"CONSTITUTIONAL LIBERTY."

"In the light of this oath, which every member of the A. P. A. takes with his hand upon his heart, we must interpret those outgivings printed in the newspapers. When he says that he attacks no man's religion so long as he does not intrude it into politics, we explain his saying as well as we can, in view of his oath that he will not employ a Roman Catholic in any capacity if he can obtain the services of a Protestant, and that he will never countenance or aid the nomination, election or appointment to public office of any Roman Catholic. Not a word is said in this oath about any distinction between Roman Catholics who attempt to make their religion an element of political power and Roman Catholics who do not; Roman Catholics, as such, are sweepingly proscribed. And when the champion of this order tells us in the newspapers that he is 'in favor of preserving constitutional liberty,' we must bear in mind that he has sworn to violate the first principle of American constitutional liberty, which forbids discrimination against men on account of their religious belief. The Constitution of the United States declares that 'no religious test shall ever be required as a qualification to any office or public trust under the United States.' All the State constitutions embody the same principle. The oath of the A. P. A. binds its members to apply a religious test to every candidate for office—to give political office to none but Protestants. This is what they mean when they say that they are 'in favor of preserving constitutional liberty.'

THE SCHOOL QUESTION.

"For one, I confess that I can not look with complacency upon the attitude of some of the Roman Catholic leaders toward the public schools; and their attempts, in cities where they have the power, to use the municipal machinery for their own purposes are not reassuring. So far as the schools are concerned, the encouraging fact is that multitudes of the Roman Catholic laymen, and not a few priests, are loyal supporters of our system of public education. Firm and reasonable treatment of the subject will strengthen this element, but a policy like that of the A. P. A. must drive the entire Roman Catholic population into

complete alienism. Could any rational Protestant expect Roman Catholics to send their children to schools under the control of men who have sworn these oaths and disseminated these forgeries?

THE DUTY OF PROTESTANTS.

"That the prevalence of this insanity will be brief is certain; but it may spread widely enough and last long enough to do incalculable mischief. May I not venture to call upon all intelligent Protestants, and especially upon Protestant clergymen, to consider well their responsibilities in relation to this epidemic? Can we afford, as Protestants, to approve by our silence such methods of warfare against Roman Catholics as this society is employing? For the honor of Protestantism is it not high time to separate ourselves from this class of 'patriots?' In any large town, if the leading Protestant clergymen will speak out clearly, the plague will be stayed or abated."

THE BIRTHPLACE OF THE JESUITS.

IN the first number of *La Revue de Paris* Pierre Loti contributes an interesting account of a journey taken by him to the great Spanish Convent of St. Ignatius at Loyola, a monastery which may be styled the birthplace of the Jesuits, and where the election of each general of the Order takes place. The convent is far away from town or village, and forms an imposing mass of building surrounding the chapel, which is the form of a basilica, and built of white and black marble. Everything about the monastery is severely simple, if we except the room which was once the cell of the founder of the Jesuits. This apartment is turned into a kind of chapel, and is now, says the French writer, of fairy-like magnificence, hung with red brocade; each object in it is of gold, and in a number of reliquaries are to be seen fragments of the humble habit and pieces of the bones of St. Ignatius Loyola. The monastery, which is also one of the noviceships of the Order, is so large that its numberless passages give the impression of a labyrinth. The walls are whitewashed, and each corridor is lined with the doors opening into narrow cells, on each door being written the name of its present occupant, French, Russian, English and German names being in almost as great predominance as Spanish. The strangest thing about Loyola seems to be the tiny feudal castle around which the monastery was built. The fathers are extremely proud of this strange survival of the Middle Ages. The walls, which are enormously thick, are made of rough stones and red brick, and so careful are the Jesuits of this curious little fortress that nothing is done which could in any way lead to its destruction, and the great monastery built around it and against it gives it the appearance of a pearl in a shell.

The Jesuits' gardens are filled with beds of chrysanthemums, and strange to say are surrounded by no wall nor even a hedge. All are free to come in and out, the very doors of the monastery being left unlocked during the daytime.

PARADISE AND THE FIRST SIN.

THE *Biblical World* (University Press of Chicago) is publishing President Harper's lectures on Genesis which are now attracting so much attention in Chicago. The lecturer's principles of investigation are thus stated by himself: "1. That the Hexateuch, which furnishes the immediate material for our investigation, is a part of a special divine revelation.

"2. That this revelation, according to its own testimony, was given gradually, in an accommodated form, being thus adjusted to the needs and capabilities of the people to whom it first came.

"3. That of necessity the limitations of one kind and another were marked and numerous; the material being, in the nature of the case, in many respects imperfect.

"4. That according to the claims of the Bible itself, we are to expect in it moral and religious truth, not historical or scientific truth.

"5. That the literary form in which this portion of the divine revelation now appears is a compilation of four distinct documents, no one of which goes farther back than 950 B. C.; it being maintained, however, that the essence of the material is Mosaic in its origin; that it is all the outgrowth of Mosaic material, and that it everywhere breathes the Mosaic spirit."

THE STORY OF EDEN.

Concerning the story of Eden, Dr. Harper reaches these conclusions:

"1. The writer of Genesis was ignorant of the real geographical and historical facts. It was not a part of the divine plan to reveal geography and history. The writer teaches that there was a place from which mankind came forth; that man was originally perfect; that he sinned, and that to-day he suffers. It would be possible to convey these truths in many ways. He takes the stories common to all ancient nations. He has no thought of geography or history. He asks simply, How can I best impress these truths upon the minds of men? He does what the prophet always does; he idealizes. There is here no history, no geography.

"2. The story is prophetic in the wide and in the narrow sense. Wilful disobedience, discontent, suspicion and lack of gratitude, a slight turning from the path of rectitude, followed by dire consequences—all this and much more the story illustrates as no page of the world's history illustrates so well. It is a picture into which every man may look and see himself, and shudder at the terrible cost of sin. It is the greatest sermon ever preached to man as a warning against sin; a sermon which millions have read and millions more will read; a sermon which will never cease to be read so long as man is man and God is God. But there is also here a promise; a prediction of a time when man will conquer his great enemy, sin; when light will once more take the place of night; peace, the place of war; life, eternal life, the place of death; the seed of the woman shall eventually gain the victory. This promise is vague. To those to whom it was first given, it must have been very vague indeed; but those to whom it is permitted to

look back upon this struggle of so many thousand years may clearly see, in spite of its vagueness, the germ which has grown, under the fostering care of the God who guided this strange history and this strange people, into Christ the Lord."

THE BOYHOOD OF JESUS CHRIST.

BEGINNING the March *Cosmopolitan* there is a paper of striking interest and of moving eloquence, by Dr. Lyman Abbott, in which, under the title, "The Son of the Carpenter," he traces the life and draws a picture of the surroundings of the boy Jesus. A number of illustrations show the present aspect of the spots connected with Christ's life. While it is scarcely fair to quote but a few paragraphs from an article which should be judged as to its unassuming yet reverential point of view, the lucid historical statements as to Christ's boyhood surroundings are so much the best thing of the sort that we have seen, that we give below certain sentences from them. Dr. Abbott says of the Jewish nation as it existed 1,893 years ago:

"Other nations looked back for their golden age; this nation looked forward. Other nations dreamed of a universal dominion, this nation, on the contrary, dreamed of a universal deliverance that was to come.

"Belonging to this peculiar nation, sharing its faith and hope, were this humble peasant and his wife.

HIS HOME LIFE AND TRAINING.

"They had one son. In accordance with the Jewish law which required every father to give his son a trade, this boy, brought up in his father's house, learned his father's trade—that of a carpenter. His boyhood life was spent in poverty. His home probably contained but a single room; the walls were of sun-dried brick; the roof was of straw. This single room was kitchen, parlor, bedroom, sitting room and workshop. It had neither window of glass nor chimney; a narrow slit in the wall, too narrow to admit the rain, admitted the light. The mother generally cooked without, on a sort of campfire. But the climate was mild; the resources contracted; the cooking slight. The mother ground a little wheat between two stones in a hand mill, and baked a thin cake upon a hot stone—this was their bread. Fruits were plenty and cheap, and an occasional fish served as an article of luxury. Often at night the father would wrap a shawl about him and sleep in the open air. As his son grew up toward manhood the son would do the same.

"There were no pictures on the walls, for the devout Jews gave a literal interpretation to the command, 'Thou shalt not make unto thee any graven image,' and confined themselves, as the Arabs do to this day, to geometrical ornamentations, now known as arabesques because they come from Arabia. Books were unknown among the peasant class to which this family belonged. Indeed, literature in the modern sense of the term was almost unknown in the nation.

The sacred books and the commentaries of the religious teachers thereupon were the only literature recognized. The writings of the pagans were looked upon with horror quite as great as that with which a devout Puritan would have regarded a century ago the products of French infidel thought and immoral imagination. The pious Jew would have as little permitted in his home the philosophy of Plato or the dramas of Æschylus, as would a New England deacon the philosophical writings of Voltaire or the comedies of Molière.

"It is probable that there were in this peasant home some fragments of the Old Testament, and it is certain that the son heard it read every Sabbath day in the synagogue, and was taught from it every day in the parish school. For the village synagogue had attached to it a school in which reading, possibly a little arithmetic, certainly the Old Testament and with it more or less of the current theological interpretation, were taught. But nothing more. The children of the peasants were not taught to write. A scribe could always be found in the street, with pen, ink and parchment, to write a letter. Science was not yet born. The only geography taught was that of the province of Palestine."

WHENCE CHRIST'S CONCEPTION OF HIS MISSION CAME.

"There are certain atmospheric influences which are sometimes more potent in affecting character than those which are organized and directed for that purpose. Of the home influence of this boy we know very little. If he had brothers and sisters they were not of a kind to inspire him; did not understand him; until after his death did not recognize his genius. Of the father we know scarcely anything—apparently he died before the boy came to maturity. At all events he disappears entirely from the scene, and Jesus at his death would hardly have committed his mother to the keeping of a friend, as he did, if the father were still living. Of the mother, the biographers of the son give us only glimpses, but they are such as to justify the Church and the world in regarding her as an almost ideal type of womanhood and motherhood. She was a woman of rare force of character—shown in that journey which she took, unattended, from Galilee to Judea, to visit Elizabeth, a dangerous expedition for a woman in those days of rough roads, lawless banditti and scant respect for women. She was a heart student of the Scriptures—shown in the one Psalm of which she is the author and which has remained in the ritual of the Church as an expression of devotion; and she had that patience which is the highest attribute of woman—shown in her standing at the cross, the helpless companion of her suffering son until he breathed his last.

"And yet it seems clear that the son did not get his conception of his mission from his mother; for it was she, who, on the one hand, was impatient for him to inaugurate his ministry by a miracle, and who, on the other hand, when that ministry brought him into conflict with the Pharisees, feared lest his enthusiasm was running into fanaticism, and would

have called him away from danger to safety and repose. In the wider influence of Palestine there is little or nothing to account for the character of this son of the carpenter. The preaching in this synagogue was much like preaching in our day—some of it good, some of it indifferent, some of it very bad. He might have heard in his boyhood from a scribe of the school of Hillel, who told him that to love God and his fellow-men was better than whole burnt offerings, or he might have heard from the scribe of the school of Shammai a discussion of the question whether it were right to eat an egg laid on the first day of the week which presumptively had been prepared by the hen on the Sabbath day. Probably he heard some preaching of both descriptions, but, on the whole, in neither of the three great schools of thought was there much to instruct or inspire—neither in the cynical and superstitious Sadducees, who denied both a personal God and a personal immortality; nor in the Essenes, the Puritans of the first century, who believed the world was hopelessly going wrong and withdrew from it to the wilderness in despair of bettering it; nor in the Pharisees, who knew no road to righteousness but that of compulsion, and so no law of righteousness but that of external statutes."

HOW NOT TO HELP THE POOR.

PRESIDENT JOHN H. FINLEY, of Knox College, continues in the March *Chautauquan* his discussion of the subject, "How Not to Help the Poor." He argues that "the system of compulsory support by the public is dangerous and harmful in that it invites undue reliance upon such support; deprives relief of the benefit which true charity confers both upon the recipient and the giver; tends to make permanent a class of paupers by the very means through which it seeks to ward off pauperism, and to bring others to the same state by the reduction of wages and by forced contributions to the poor fund."

THE TEN COMMANDMENTS OF CHARITY.

The ten commandments of charity, says President Finley, are:

"Thou shalt have no other motive in giving before the good of the poor.

"Thou shalt not give to the beggar because he is a beggar, for the iniquity of such a gift may be visited unto the third and fourth generations of him who receives it.

"Thou shalt not take the name of charity in vain.

"Thou shalt not tempt son or daughter to thrust father or mother or brother or sister upon the poor rate.

"Remember the spirit of charity to keep it holy.

"Thou shalt not kill the soul of man by feeding his stomach.

"Thou shalt not let mothers bury their shame in an orphan asylum nor fathers hide their greed.

"Thou shalt not rob the poor to feed the pauper.

"Thou shalt not covet the name of philanthropist for thine own glory.

"Thou shalt not let thy giving bear false witness to its motive.

"If these or like commandments were taught by the churches to-day, and were learned by all private as well as corporate and church givers, we should be able to dispense with the historic poor law, the mother of all poor laws, and to substitute for the harmful private charity of the past an organized discriminating charity with the spirit which belongs to the old Greek word from which it is derived, and which belongs also to that word of Anglo-Saxon origin which has been substituted for it in the Revised Version of the New Testament, love."

"UNION FOR PUBLIC GOOD."

"UNION for Practical Progress" is the title of a series of papers which Rev. Hiram Vrooman begins in the February *Arena*. He describes the Baltimore Union for Public Good (formed June 19 last) as the best model for a National Union of Moral Forces.

"This body is composed of delegates from nearly all the religious, philanthropic and reform societies of the city, and its purpose is to make practicable concerted action on the part of all persons interested in the public good, . . . to promote the good government, health and prosperity of the city of Baltimore, to secure useful and prevent injurious legislation affecting its interests, to correct public scandals, grievances and abuses, to restrain all forms of vice and immorality and to encourage the co-operation of individuals and existing societies aiming to advance these ends. Any congregation or society having for its object the moral or social improvement of the community may be affiliated to this association and shall be represented at its meetings by three delegates, to be selected in such manner as each society may determine and provided with credentials signed by its chief officer." Its president is Charles J. Bonaparte, grandnephew of the first Napoleon.

First Steps.

A second paper, advocating this reform movement, appears in the March *Arena*, from the pen of the Rev. Walter Vrooman. The writer describes some of the "First Steps in the Union of Reform Forces." He declares that "three earnest men or women, without wealth or special talents, by attaching themselves to the Union for Practical Progress, can in six months' time revolutionize the methods of religious and moral work in the town or city in which they live."

A definite programme of organization is outlined. The local union is to secure the co-operation of the churches. "Our three or more earnest persons who start the work in each village, town and city, will correspond regularly with the religious teachers of their respective localities; they will arrange meetings, circulate literature, form classes and organize clubs. At first their influence over existing churches and societies will be small, resting only on the wisdom of their programme. But as the years go by, their influ-

ence will increase, men will learn the economy of concerted action, and the Union for Practical Progress will become to the separate churches and reform societies, what our country is to the separate states."

A STUDY OF CITY TRAMPS.

MR. JOSIAH FLYNT continues in the March *Century* his valuable and entertaining studies of tramp life, taking for his subject, this time, "The City Tramp."

"Vagabonds," he says, "specialize nowadays quite as much as other people. The fight for existence makes them do it. Although a few tramps are such all-round men that they can succeed almost anywhere, there are a great many others who find that they must devote their time to one distinct line of begging in order to succeed. So to-day we have all sorts of hoboos. There are house-beggars, office-beggars, street-beggars, old-clothes-beggars, and of late years still another specialization has become popular in vagabondage. It is called 'land-squatting,' which means that the beggar in question has chosen a particular district for his operations. Of course a large number of tramps still go over all the country, but it is becoming quite customary for vagabonds to pick out certain States and counties for their homes. The country, as a whole, is so large that no beggar can ever really know it on business principles, and some clever beggars not long ago decided that it is better to know thoroughly a small district than to have only a general knowledge of the entire continent. Consequently, our large cities have become overrun with tramps who make them their homes the year around, till America can almost compete with England in the number of her 'city vags.' There is no large town in the United States that does not support its share, and it is seldom that these tramps are natives of the towns in which they beg. In New York, for example, there are scores of beggars who were born in Chicago, and *vice versa*. They have simply picked out the city which pleases them most and gone there. After a certain number of years they become so numerous that it is found necessary to specialize still further, and even to divide the town itself into districts, and to assign them to distinct kinds of begging. It is of these specialists in vagrancy that I intend to write in this paper."

"THE TOMATO-CAN VAG."

"The lowest type is what is called in tramp parlance 'the tomato-can vag.' In New York City, which has its full quota of these miserable creatures, they live in boxes, barrels, cellars, and nooks and corners of all sorts, where they can curl up and have a 'doss' (sleep). They get their food, if it can be called that, by picking over the refuse in the slop-barrels and cans of the dirty alleys. They beg very little, asking usually for the stale beer they find now and then in the kegs near saloons. Money is something they seldom touch, and yet a good many of them have been first-class criminals and hoboos in their day.

"I used to know a tomato-can tramp who lived for several months in a hogshhead near the east side docks of New York. I visited him one night when on a stroll in that part of the city, and had a talk about his life. After he had reeled off a fine lot of yarns, he said :

" ' Why, I remember jes lots o' things. I's been a crook, I's been a moocher, an' now I's shatin' on me uppers. Why, what I's seen would keep them blokes up there in Cooper Union readin' all winter, I guess. '

"This was probably true. He had been everywhere, and had seen and done nearly everything which the usual outcast can, and he wound up his life simply 'shatin' on his uppers.' No one will have any dealings with such a tramp except the men and women in his own class. He is hated by all the beggars above him, and they 'do' him every chance they get."

A HIGHER TYPE.

"The next higher type of the town tramp is the two-cent dossier—the man who lives in stale beer shops. In New York he is usually to be found about Mulberry Bend, the last resort of metropolitan outcasts before dropping down into 'the-barrel-and-box kentry.' This district supports a queer kind of lodging house called by the men who use it 'the two-cent doss.' It is really a makeshift for a restaurant, and is occasionally kept by an Italian. The lodgers come in late in the evening, pay two cents for some stale beer or coffee and then scramble for 'spots' on the benches or floor. All nationalities are represented. I have found in one of these places Chinamen, Frenchmen, Germans, Italians, Poles, negroes, Irishmen, Englishmen and 'Mer'cans,' and they were all as happy as could be. They beg just enough to keep them in 'booze,' their food being found mainly at 'free lunches.' Like the tomato-can tramp, they have little intercourse with beggars above them. By this I mean, of course, that they know they will not be treated very sociably outside their class, and decide very wisely to remain where they belong. They rarely leave a town which they have picked out as a home, and some of them never even get out of their small district."

THE VARIETIES OF "THE LODGING-HOUSE GANG."

"The other types of city vagabondage can be classified as 'the lodgin'-house gang,' with the exception of the room-beggar. I must therefore consider them in relation to their different styles of begging rather than living; for when once a beggar can live in any sort of lodging house he has a right to belong to the general crowd, no matter what he pays for his bed. The 'seven-center' house, for instance, is considerably lower than the 'ten-center,' but its being a lodging house is sufficient to separate its inmates entirely from the two classes who live in boxes and beer shops. And to make the classifying feature more intelligible, I shall give first a short account of the lodging house in all its grades, omitting only those that are carried on by charity.

"Beginning with the lowest, there is the 'seven-center,' in which hammocks of a bad order are used as beds. The covering is very often the lodger's coat, unless he happens to have a blanket of his own. In winter there is a large stove in the middle of the sleeping room, and this keeps things fairly warm. The usual lodger in this house is the town tramp, although the wandering hobo goes there, too. I have also seen a few genuine seekers of work there, but never two nights running. One night is usually enough, and they sleep out in preference to mixing in such a crowd as the place shelters.

"The 'ten-center' is the next grade above, and is probably the most popular of all in the United States. It is built after various models, the commonest being the 'double-decker,' where the bunks are made of gas-pipe, one right above the other. In this case the bedding is a straw tick and a blanket; that is all, as a rule. Yet I have known sheets to be used. Another model is something like the fore-castle of a ship. Around the walls several tiers of bunks are built, sometimes twelve feet high, and in the middle is the 'sitting-room,' with stove and chairs. Occasionally the only bedding is straw, there being no blanket of any kind. The class of men found in places of this type is hard to describe; the town tramp is there, and so is almost every other kind of vagabond. It is a sort of cesspool into which are drained all sorts of vagabonds, and the only way to distinguish them is to know them personally. Young and old, the intelligent and the ignorant, the criminal and the news-boy, all are found in the 'ten-center.'"

THE TRICKS OF STREET-BEGGARS.

Women very often make the keenest street-beggars. They are more original in posing and dressing, and if with their other talents they can also use their voices cleverly, they do very well.

"The business of the house-beggar is obviously to know a certain number of good houses in his district, just as the street-beggar knows a certain number of people in his street or streets. And if he is a mendicant who can deal with women more successfully than with men, he must know just when to visit houses in order that only the women may be at home. If he is a beggar of this style, he usually carries a 'jigger'—in other words, an artificially made sore, placed usually on an arm or a leg. He calls at the front door and asks for 'the lady.' When she appears he 'sizes her up' as best he can, and decides whether it will pay to use his 'jigger.' If it is necessary, he prefaces this disgusting scene by a little talk about his hardships, and claims that he has been very badly burned. Then he shows his miserable sore, and few women are callous enough to see it without flinching. If they 'squeal,' as the tramp says, he is sure to be rewarded.

"Another trick is to send around pretty little girls and boys to do the begging. A child will succeed at house-begging when an able-bodied man or woman will fail utterly, and the same is true of a very old man—the more of a centenarian he looks, the better."

THE IMPROVEMENT OF THE NEGRO.

GEN. THOMAS. J. MORGAN, commissioner of Indian affairs under President Harrison and at present corresponding secretary of the American Baptist Home Mission Society, contributes to the monthly published by that organization an article on the negro question. His views are largely based on observations and inquiries which he made while on a recent tour through the South, and are contained in the following paragraphs :

MORALITY AND RELIGION.

"I believe that I voice the growing sentiment of the best friends of the negroes, who are familiar with all the circumstances, when I say that just now the hope of the negro is neither in the bullet nor the ballot, but rather in the Bible and spelling-book and the hoe. It is of supreme importance to them that they should refrain from crime and from vice. It is not enough for them to be able to say that all the offenses against the white man that can be charged upon the negro are doubly true of the offenses committed against themselves by the whites. Their own hands must be clean before they can successfully resist the outrageous injustice of others. The truest solvent for all their wrongs must be found in the religion of Jesus Christ. When it can be said of the negroes generally that they are not only religious emotionally, but practically; that they are not only law-abiding, but are men of integrity of conduct, and purity of life, they will compel public respect. The best service we can render them, therefore, is in the strengthening of the Baptist churches, the improvement of the instruction in their Sunday schools, and the elevation of the character and attainment of their preachers.

CULTURE.

"Next to religion the great desideratum is education. It should be their aim to secure for their children, through the public schools and by every other available means, a universal common school education. An illiterate negro should be a rarity. An increasing number of them should seek the training that is offered by the academies and colleges. As the general standard of intelligence among them is raised by the common school, there will be an increased necessity for men and women of higher grades of culture who shall act as leaders and guides. The way is now open, or at least is opening, for a vast number of competent men and women in the higher walks of life. The professions of teaching, the ministry, the law, medicine and journalism now call for an increasing number of well trained, competent men and women of broad culture.

THRIFT.

"Next to religion and education, if not prior to both, should be placed as an indispensable condition of the progress of the negro race, the necessity of skilled labor. The negro has been trained by generations of slavery to toil, but his labor has been unintelligent and forced. What is needed now is not so

much a knowledge of the rudiments of work in the field and in the shop, as an intelligent mastery of the elements of industrial success. There is a field for intelligent mechanics, carpenters, blacksmiths, harness makers, machinists; and there is a great opportunity for gardeners, farmers, fruit growers and others, who are able to diversify the industries of the South and supplant the old mechanical methods by modern scientific processes.

LET POLITICS ALONE.

"I am inclined to think that the best thing that the negroes can do for the next ten years is to eschew politics almost *in toto* and to devote themselves assiduously to the improvement of their material, mental and moral condition. They will find ample opportunities for the employment of all their energies in cultivating their fields, improving their homes, building churches, organizing mission work and in establishing and endowing schools, and in fitting themselves for the highest usefulness by the most rigid training in the various schools and colleges now opened to them. In due time there will come to them a recognition such as is always bestowed upon industry, thrift, culture and character."

CIVIC ABUSES IN NEW YORK CITY.

As Seen by Mr. Howells' Altrurian.

ONE does not come away from Mr. Howells' Altrurian letters with any optimistic assurance as to the beauty and justice of the institutions of what we are pleased to call our civilization. The March *Cosmopolitan* publishes the latest epistolary budget from the Altrurian visitor under the title "Plutocratic Contrasts and Contradictions," which lead the novelist into animadversions on the streets, the cable cars, the elevated railroad, the tall apartment houses of the metropolis, and the dress, the poverty and wealth of its people. As to the rapid transit—we can imagine what a humanist and socialist such as Mr. Howells could find to criticise in it. "You have absolutely no experience of noise in the Altrurian life which can enable you to conceive of the hellish din that bursts upon the sense, when at some corner two cars encounter on the parallel tracks below, while two trains roar and shriek and hiss on the rails overhead, and a turmoil of rattling express wagons, heavy drays and trucks, and carts, hacks, carriages and huge vans rolls itself between and beneath the prime agents of the uproar."

THE CIVIC ASPECTS OF NEW YORK RAILWAYS.

"The street car company which took possession of Broadway never paid the abutters anything, I believe, and the elevated railroad companies are still resisting payment of damages on the four avenues which they occupied for their way up and down the city without offering compensation to the property owners along their route. If the community had built these roads, it would have indemnified every one, for the community is always just when it is the expression of the common

honesty here; and if it is ever unjust, it is because the uncommon dishonesty has contrived to corrupt it.

"Yet the Americans trust themselves so little in their civic embodiment that the movement for the public ownership of the railroads makes head slowly against an inconceivable prejudice. Last winter, when the problem of rapid transit pressed sorely upon the New Yorkers, the commission in charge could find no way to solve it but by offering an extension of franchise to the corporation which has already the monopoly of it. There was no question of the city's building the roads and working them at cost; and if there had been, there would have been no question of submitting the project to those whose interests are involved. They have no such thing here as the referendum, and the Americans who are supposed to make their own laws merely elect their representatives, and have no voice themselves in approving or condemning legislation."

ESTHETICS AND THE REAL ESTATE OPERATOR.

"In one place you will see a vast and lofty edifice, of brick or stone, and on each side of it or in front of it a structure one-fourth as high, or a row of scurvy hovels, left there till a purchaser comes, not to pay the honest worth of the land for it, but to yield the price the owner wants. In other places you see long stretches of high board fence, shutting in vacant lots, usually the best lots on the street, which the landlord holds for the rise destined to accrue to him from the building all round and beyond his property. In the meantime he pays a low tax on his land compared with the tax which the improved property pays, and gets some meager return for the use of his fence by the Italian fruiterers who build their stalls into it, and by the bill posters who cover it with a medley of theatrical announcements, picturing the scenes of the different plays and persons of the players. To the Altrurian public the selfishness of a man willing idly to benefit by the industry and energy of others in giving value to his possessions would be unimaginable. Yet this is so common here that it is accepted and honored as a proof of business sagacity; and the man who knows how to hold onto his land, until the very moment when it can enrich him most, though he has neither plowed nor sown it, or laid the foundation of a human dwelling upon it, is honored as a longheaded and solid citizen, who deserves well of his neighbors. There are many things which unite to render the avenues unseemly and unsightly, such as the apparently desperate tastelessness and the apparently instinctive uncleanness of the New Yorkers. But as I stand at some point commanding a long stretch of one of their tiresome perspectives, which is architecturally like nothing so much as a horse's jawbone with the teeth broken or dislodged at intervals, I can blame nothing so much for the hideous effect as the rapacity of the land owner holding on for a rise, as it is called. It is he who breaks the skyline, and keeps the street, mean and poor at the best in design, a defeated purpose, and a chaos come again.

THE WORST OF IT ALL.

"The life of the poor here seemed to me symbolized in a waste and ruined field that I came upon the other day in one of the westward avenues, which had imaginably once been the grounds about a pleasant home, or perhaps a public square. Till I saw this I did not think any piece of our mother earth could have been made to look so brutal and desolate amidst the habitations of men. But every spear of grass had been torn from it; the hardened and barren soil was furrowed and corrugated like a haggard face, and it was all strewn with clubs and stones, as if it had been a savage battleground. A few trees, that seemed beaten back, stood aloof from the borders next the streets, where some courses of an ancient stone wall rose in places above the pavement. I found the sight of it actually depraving; it made me feel ruffianly.

A SUGGESTION ON THE LIQUOR QUESTION.

"I perceive," continues the Altrurian, "that as long as there is poverty there must be drunkenness, until the State interferes and sells a man only so much as he can safely drink. Yet, knowing as I do from the daily witness of the press and the courts, that drink is the source of most of the crimes and vices which curse this people, I find the private traffic in alcohol infinitely shocking and the spectacle of it incredible. There is scarcely a block on any of the poorer avenues which has not its liquor store, and generally there are two; wherever a street crosses them there is a saloon on at least one of the corners: sometimes on two, sometimes on three, sometimes even on all four. I had one day the curiosity to count the saloons on Sixth avenue, between the Park and the point down town where the avenue properly ends. In a stretch of some two miles I counted ninety of them, besides the eating houses where you can buy drink with your meat; and this avenue is probably far less infested with the traffic than some others.

"You may, therefore, safely suppose that out of the hundred miles of shops, there are ten, or fifteen, or twenty miles of saloons. They have the best places on the avenues, and on the whole they make the handsomest show. They all have a cheerful and inviting look and if you step within you find them cozy, quiet, and for New York, clean. There are commonly tables set about in them, where their frequenters can take their beer or whisky at their ease, and eat the free lunch which is often given in them; in a rear room you see a billiard table. In fact, they form the poor man's clubhouses, and if he might resort to them with his family and be in the control of the State as to the amount he should spend and drink there, I could not think them without their rightful place in an economy which saps the vital forces of the laborer with overwork or keeps him in a fever of despair, as to the chances of getting or not getting work when he has lost it. We at home have so long passed the sad necessity to which such places minister that we sometimes forget it, but you know how in our old competitive days this traffic was one of the first to be taken out of private hands and assumed by

the State, which continued to manage it without a profit so long as the twin crazes of competition and drunkenness endured among us. If you suggested this to the average American, however, he would be horror-struck. He would tell you that what you proposed was little better than anarchy; that in a free country you must always leave private persons free to debauch men's souls and bodies with drink and make money out of their ruin; that anything else was contrary to human nature and an invasion of the sacred rights of the individual."

ELECTORAL CORRUPTION: ITS CAUSE AND CURE.

THIS is the title of an article in the *Cornell Magazine*, by Prof. J. W. Jenks. The writer begins with the assumption that corruption is "the fundamentally inherent vice of democratic government." He believes, however, that the mass of the people wish pure elections, and that corruption may be so limited as to do away with its serious effect on government. He finds the causes of electoral corruption as it exists to-day in "natural motives and often good ones," and illustrates this apparent paradox by citing the influences brought to bear on German officials under Bismarck, to secure support of the government, from patriotic motives, and the subsidizing of the press in France from the secret service fund, presumably in the interest of the country. "In like manner many an employer who, directly or indirectly, has coerced his employees into voting as he believes, feels that only his party's policy is right, and that his act is therefore laudable and in the workmen's interest. Many a party leader who has raised corruption funds and directed their expenditure has sincerely believed that his party could not win without bribery, and that the success of the opposition would be a far more serious evil to the country than the bribing of a few 'floaters' whose moral sense was already blunted. If the influence of bribery ended with the single act, the argument would be strong."

DEGREES OF CORRUPTION.

Prof. Jenks goes on to show that the larger number of bribing politicians have far more selfish aims; they work for money and office; while a large proportion of the ignorant men who receive bribes are not even conscious that they are committing any serious wrong. Even the intelligent classes are not fully awake to the wrong involved, it would seem, since college students often receive traveling expenses to and from the polls from the party committees. "The nature of corruption and the difficulty of controlling it appear more clearly, too, when we consider its extent and the places where it is most prevalent. People who live in districts that are 'safe' for either party, especially if the people are also fairly well-to-do, have no conception of the subject. In such places, there is only here and there a case of corruption, and that is mostly some kind of treating given to add force to an argument, or it is covered under the head of paying for services at the polls. Where, however, the district is a close one and the ignorant voters are

numerous, the proportion treated or bribed is high. In such districts it is not uncommon for twenty-five per cent. to fifty per cent. to be thus managed, while cases are found—as they have been found in similar circumstances in England and elsewhere, for we are no worse by nature than other people—where nearly all the voters are corrupted. As was said at the beginning, corruption is the normal condition of a country with many ignorant voters and great electoral prizes. It will always be found, unless special measures are taken to prevent it."

WHAT TO DO ABOUT IT.

As a preliminary step toward realizing his ideal of independent judgment on the part of the voter, Prof. Jenks would exclude from the suffrage all idiots and insane persons (as is now done) and also paupers, or persons receiving public relief. He would also exclude immigrants till it becomes evident that they really understand our government well enough to be able to form an independent opinion on the issues of the day. This would require a residence of at least three years. Finally, all who give or receive bribes should be thereby disfranchised for two or three years for the first offense, permanently for the second.

The safeguards against corruption which Prof. Jenks recommends—chiefly the secret ballot and "corrupt practices" laws—have been discussed by him in other articles. He further advocates a system of proportional representation. On the whole, he believes that public opinion has been aroused to the importance of the matter, and that the people will act.

Suppression of Bribery in England.

In the *March Century*, Prof. Jenks gives the results of his personal inspection of the workings of the English Corrupt Practices Act, which is frequently cited as a model for American imitation.

ENGLISH ELECTIONS SEEN THROUGH AMERICAN EYES.

"The conclusion of the whole matter is a very clear one. Englishmen are very human. The voters there are often ignorant and careless about their votes, as in every country where the suffrage is a broad one. Often the voters are men who have few high aims, but who have low, selfish appetites that they like to satisfy. The candidates and their agents like to win, and for the sake of winning they will do as the voters wish in many cases, if they dare. They appeal to the higher motives first and most strongly; then to prejudice; then, if need be, at times, to the lowest motives of greed and appetite.

WHAT LAW HAS DONE.

"The law, however, is most rigid, and, on the whole, public opinion is behind it. The risk from corruption is so great that warnings not to violate the law are put forward most prominently by all parties, and the dangers of so doing are fully explained. Without the risk involved in corruption, there would be much more of it. There are still a very little bribery; a little personation; more, but still not very

much, treating; some coercion by employers, some by priests; a good deal of trickery and misrepresentation that is mean but very natural, and which often comes from sincere but narrow prejudice; and a good deal of indirect, and, on the whole, I think very insidious and evil, though not always illegal, corruption committed while 'nursing the constituencies.' This evil is hardly so much political as social.

AS COMPARED WITH OTHER COUNTRIES.

"From all that I can learn, what corrupt practices exist are to be found mostly in the parliamentary elections. Those for the county councils and those more strictly local are, as might be expected perhaps, more free even than the parliamentary from corrupt practices of all kinds. On the whole, speaking broadly and comparatively, the elections of England are pure—probably, on the whole, better than those of France or Germany, far better than those of the United States. I think that one may say that they are purer than in any other of the great States where the political interest is so powerful. There is probably no more bribery or treating or personation in Germany, no more coercion by employers; but the government has sometimes made its coercive power felt more there, and the same thing holds true, in a somewhat different way, in France and Italy.

LESSONS OF EXPERIENCE.

"England, from a state of the worst corruption, has reached a very enviable condition, and this in good part as the result of her lawmaking. I have shown, I think, the very worst that can be said and I have in a great measure left unsaid the good; but the relative weakness of the bad side brings out the strength of the good.

"The experience of England seems to point out the next step for us to take, for we must not assume that any legislation on that subject will be final.

"There were more petitions to unseat members after the election of 1892 in England than after that of 1885. Presumably the politicians found the law more terrifying when it was new and were therefore unwilling to take so many risks in evading it. This is often the case with such a law. After a time it can be more or less successfully evaded and it must then be amended to meet new tricks. So we shall in the future, perhaps, need much legislation to keep the suffrage pure; civil service reform; some limiting qualifications of the suffrage for immigrants, perhaps, or for the ignorant and corrupt—possibly the proportional system of representation that works so strongly for purity in Switzerland. But, for the immediate future, we can most wisely look to corrupt practices acts, framed in the main on the English model, with, of course, due adaptation to our forms of government and of party organization. Seven of our States have already framed such laws, though most of them will probably need to be made more stringent and detailed. But such laws, with the Australian ballot to aid and a favoring public opinion to enforce them, can, for the present at least, give us within measurable distance a pure ballot."

RECENT RAILROAD FAILURES AND THEIR LESSONS.

ONE who has read from day to day the history of the business failures of the last year is hardly surprised to learn from Mr. Simon Sterne's article in the *Forum* that "since the first of January, 1893, about one-sixth of the total mileage of the railways of the United States, representing a capitalization in bonds and stock of \$750,000,000, has passed from the control of the proprietary interest into the hands of the country to be administered by receivers." This result, says Mr. Sterne, "has not been due to a long series of failures of crops, nor to diminished earning capacity of the railway companies themselves from the over-construction of new lines, nor to any such general public calamity to business enterprises as to make the misfortune to railway investment but part of a general disaster overtaking the country." Nor does he hold the Interstate Commerce act in any but a very remote and an almost unappreciable degree responsible for the extraordinary calamity which has overtaken the railroad interest of the country.

Mr. Sterne's first explanation of the phase of the railroad problem presented by the events of 1893 is that the railroads have outgrown the ability of the community to furnish men of the high moral and intellectual order necessary for their proper administration.

CAUSES OF FAILURE.

Furthermore, it is evident from Mr. Sterne's account that the railway corporations of the United States literally live from hand to mouth and have no working or reserve capital whatever, although it would seem that their business requires it more than any other. "The railways are capitalized for much more than they are worth. Usually the bonded indebtedness of the line, car-trust certificates, equipment and terminal securities, taken at par, represent a value in excess of the cost of the road, and upon them fixed interest is compulsorily payable. Hence, whatever the road earns upon actual cost must, unless it exceed say six per cent., be paid out annually in the shape of interest alone. As interest runs on the bonds long before the completion, during the construction of the road a part of the bonds are issued to cover payments of interest; in other words, a principal indebtedness is created to provide interest during construction, and thus the sum total of funded debt is increased at the outset, representing an expenditure which never can figure as an asset. When the railway is completed, its earning capacity, for better or for worse, as compared with expectation, begins. Usually there is no surplus to make good the depreciation in the value of the instruments of production, the necessity for the replacement of which is, from the start, an important factor of vanishing capital in every modern industrial enterprise. No manufacturer is a conservative business man who does not annually write off at least about ten per cent. of capitalization for depreciation of plant, and who does not provide a corresponding fund to replace old machinery with

new, and existing devices with new inventions, so as to keep pace, in a constantly progressive community, with its march of improvement and invention. If he fails to do this, and keeps in his capital account, on which he must pay interest, amounts representing machines which have gone to the scrap-heap, the first financial storm must topple him over.

NO RESERVE FUND.

"A railway, from the moment it is opened, must re-begin its process of construction, and, indeed, physically bebuild its road as its traffic develops. . . . The original bonded indebtedness, representing ties that have rotted, rails that have been sold, cars that have been broken up, bridges and engines that have disappeared, remains a charge upon the road in the shape of bonds bearing interest."

"All this vicious business produces the result that large floating debts are constantly increasing and the shock of a single bad year affecting their income or credit, produces insolvency; and then the fact is at once apparent that, except in the older parts of the railway systems of the United States, there is between the creditor and the railway no buffer in the way of a reserve fund or a stockholding interest, representing actual money investment in stock, to take up the shock of this disappointment in receipts or credit.

RAILWAY RECEIVERSHIPS.

"Another evil of railroad administration in the United States, lies," says Mr. Sterne, "in the courts themselves in creating railway receiverships. A railway official, in consequence of his incapacity or misfortune or as the victim of a vicious system, brings a railway into bankruptcy. He then—supported often by the trustee of the mortgage—is appointed receiver by the courts, on the application either of the company or of the complacent trustee or of an equally complacent creditor, and, in his capacity as receiver, continues to earn probably a larger salary than he did as president. The only excuse for such an appointment is that such an officer has the requisite knowledge of details necessary for the continued administration of the property. This evil is a monstrous one. When a great property like a railway gets into financial difficulties, there should be no haste in the appointment of a permanent receiver; and, in any event, the executive officer, in whose hands the company defaulted and whose administration should be most rigidly inquired into by the courts, should be the last person to be appointed in that capacity." Mr. Sterne urges that a law be passed by the Congress of the United States and by the various legislatures of States for the purpose of checking what he considers to be the too frequent appointments of receivers.

SUGGESTED REFORMS.

"Finally," says Mr. Sterne, "for the proper financial resuscitation of the railway system of the country after the calamitous events of 1893, and to prevent its recurrence, I believe that a uniform and conservative system of railway legislation, simultaneously enacted by the States of the Union, and

strengthened by Federal legislation, is imperatively necessary. The trustee relation of the majority of the stockholders toward the minority should be recognized and enforced. The minority should, in proportion to their strength, perpetually have a voice in the management; the crude confiscatory and communistic legislation of the Southern and Western States, on these subjects, should give way to scientific and conservative measures. Railways should be secured a field of operations, until public necessities require the construction of additional lines, and in that field held to a strict public accountability so as to prevent oppression; reasonable facilities should be afforded for the development of a fund to meet the public requirements for additional safety and accommodation to railway servants and the public. The trustee character of directors and administrators should be insisted upon, and breaches of such trust severely punished. Pooling should be permitted under the control and supervision of a public body like the National Railway Commission, and the evils of receiverships and the waste of reorganizations limited, if not wholly prevented; an official accounting should be provided for, and some safeguards found against the secret accumulation of floating debt. These reforms cannot be accomplished without work and sacrifice, without which, however, no good things in this world are accomplished."

THE BANKS AND THE PANIC OF 1893.

ALEXANDER D. NOYES considers in the current number of the *Political Science Quarterly* the relations which American banks sustained to the financial disturbances of last summer. After a thoughtful discussion of certain defects in our present banking system, such as the carrying and loaning out, in city banks, of interior banks' legal reserves, Mr. Noyes concludes that many banks were to a certain extent culpable in the inflation that preceded the last panic, while many were themselves victims of outside circumstances. "When we discuss, however, the conduct and policy of the banks after the panic of 1893 had actually begun, we stand on firmer ground. Every banking institution has its own peculiar responsibility placed upon it in time of panic, but the gravest responsibility by far rests on the great city depositories. In 1857, in 1861 and in 1873, the banks of the leading Eastern cities were the first to set an example of general suspension. With one noteworthy exception—the maintenance of payments by the Chicago banks in 1873—the panic record of our city banks, up to the last ten years, is a discreditable chapter of nerveless fright and easy surrender. It is, therefore, a gratifying fact to recognize, that though the violence of panic shock in 1893 was greater than in any preceding year, no general bank suspension followed, and in the Eastern cities no suspension whatever except as a result of actual insolvency.

SOUND PANIC BANKING.

"Nor is this all that can be said in praise. The reserve cities furnished throughout the crisis a memo-

able exposition of the principles of sound panic banking. The time-honored rule established by the 'Bullion Report' to Parliament in 1810, that in time of panic banks should discount freely and fearlessly for all solvent customers, was observed in a remarkable degree. In New York City, in ordinary times, the loan account often falls far below the deposit total; it rarely exceeds it. Between June 4, 1893, the week when panic may be said fairly to have begun, and August 5, which may be called the height of actual panic, deposits in the sixty-four New York clearing house banks decreased \$58,466,000, and actual specie and legal tender holdings \$49,621,800. This was a terribly sudden and violent impairment of reserves, the actual money decrease being thirty-eight per cent. Yet in the face of it, outstanding loans were contracted only \$7,972,700. This remarkable maintenance of bank accommodation to borrowers, in the face of monetary crisis, was made possible by two distinct and wise measures of policy. The first was a firm and continuous curtailment of outstanding loans before the panic's actual outbreak. This was to strengthen cash resources and reduce pressing liabilities. The second measure was the adoption, when once real panic had begun, of a policy almost exactly opposite. This was the issue of clearing house certificates, in order to maintain the loan account."

THE CAUSE OF INCREASED HOARDING.

The restrictions on cash payments to depositors made by the New York banks led, in the writer's opinion, to increased hoarding.

"So completely, under the bank restrictions, did paper money disappear, that by the middle of August business of every kind was being done with specie, and people who in years had never touched a gold piece for their common uses were making daily payments in eagles and double-eagles. This money came not from the 'purchases' from currency hoarders, but from the European gold importations. By the end of August practically all the banks had resumed full payment to depositors. But for a long time hardly any paper currency was paid; and how little the Wall Street purchases contributed to the recovery, the bank exhibits show. From August 5 to September 2—a period covering the existence of the currency premium—the specie holdings of the New York City banks increased by \$10,930,700. But holdings of legal tenders increased only \$1,785,800, and deposits only \$1,064,900."

THE PROPOSED CABLES ACROSS THE PACIFIC.

THE Hawaiian difficulty has called attention prominently to the importance of a Pacific submarine cable. For some time there have been on foot two distinct schemes for cables across the Pacific, one, which may be called the American plan, for a line from California to Japan, via the Sandwich Islands; the other, which may be called the British Canadian-Australian plan, for a line from Vancouver to Australia, via Sandwich, Samoan and

Fiji Islands. The advantages to be secured by the construction of either or both of these cable lines are set forth by Mr. Herbert Laws Webb, in the *Engineering Magazine*.

THE AMERICAN AND IMPERIAL ROUTES.

Of the two proposed routes, Mr. Webb is convinced that the Imperial route, the one from Canada to Australia, is the most attractive. "Apart from the question of joining the colonies together, it has the distinct advantage of containing a greater number of sections, which renders the line easier to operate and also gives greater opportunities for picking up traffic and subsidies. It has five sections, none of them of extraordinary length.

"The American route, on the other hand, has only two sections, one of which is of extraordinary length. The section from Hawaii to Japan will be over thirty-four hundred miles long, nearly a thousand miles more than the longest of the Atlantic cables. Such a long cable would be expensive to operate, as the transmission would be comparatively slow, and any interruptions would be very costly and the making of repairs would be increasingly great."

In spite of the obstacles in the way of operating the so-called American cable, Mr. Webb thinks that before long it will be a necessity of commerce. He shows clearly that from a practical point of view a single line across the Pacific would be unsafe, for the reason that the first requisite in a telegraph service being permanence, the only safeguard against interruptions or breakage of the service is duplication. Moreover, the longer the cables the greater the necessity for providing against interruptions. There seems to be no reason, therefore, why both the Pacific cables should not eventually be laid over both the American and Imperial routes.

ADVANTAGES TO BE SECURED.

"The Pacific cables will find their principal traffic," says Mr. Webb, "through providing a more direct route between Australasia and the American continent. There is already considerable trade between this country and Australia, China and Japan, and more direct communication cannot but give that trade a great incentive. Cables connecting America with Australia and Japan will give her quick communication besides with the Straits Settlements, the Philippines, China, Siam, Tonquin, India and Asiatic Russia. They will provide an alternate route from Great Britain to the extreme East and Australia, and other sources of traffic will be found in Canada and South America. The completion of the trans-Siberian railway, opening up communication across a vast tract of most varied resources, will introduce an important change in the channels of commerce in that part of the world that the cables will draw on for their traffic."

THE WORK ALREADY BEGUN.

The United States government has already made a survey of the section between California and Hawaii, which shows the only difficulty to contend with is the

great depth of the ocean, but this is after all not very much of a difficulty when the evenness of the bottom and its favorable position are taken into account.

A beginning has also been made, in a small way at the distant end of the Imperial line, by the laying of a cable from Queensland to New Caledonia. "This has been laid by a French company—the Société Française des Télégraphes Sousmarins—with the assurance of subsidies from the colonies interested. The cable company proposes to lay further sections to the Fijis, Samoa, the Fannings, Hawaii, and California, and is agitating for subsidies in competition with the promoters of the American and Imperial schemes."

A NAVAL UNION WITH GREAT BRITAIN.

MAJOR SIR G. S. CLARKE, K.C.M.G., presents in the *North American Review* an article on "Naval Union with Great Britain," which is in the nature of a reply to Mr. Carnegie's article, "A Look Ahead," in an earlier number. In the prefatory paragraphs Major Clarke announces that he writes in no spirit of mere criticism of Mr. Carnegie's views, but with an earnest desire to find some practical first steps acceptable to both nations capable of being carried into immediate effect. He regards Mr. Carnegie's dream of an Anglo-American commonwealth possible, but the realization of it "hopelessly remote." In the first place, the reunion for which Mr. Carnegie contends ignores the powerful factor of a vigorous distinctive nationality, which has grown up in the hundred and more years which have passed since the North American colonies fought for and achieved their independence. "To me," says Major Clarke, "mountains loom where Mr. Carnegie sees only the light mists of morning. They are not impassable, but the paths are not yet clear and the way is long. In Mr. Carnegie's vision the British Empire, parceled off apparently into separate States, is bodily incorporated with the Union, thus changing a form of government which has been the growth of centuries, abandoning at one stroke the position of a sovereign state held for nearly a thousand years, and claiming henceforth only a minority representation in a new national parliament which might vote away the old flag. It is all conceivable; the mutual benefits would be enormous; but for England, at least, it is a revolution such as the world has never seen, and even the great republic which swallows with ease an Arizona or an Idaho, would reel under the shock." Before England could enter the union she must first abandon her responsibilities in India or wait until India is self-governed. Major Clarke states positively that England will never flinch from responsibilities in the East, and furthermore states that it may be hundreds of years before a transformation to self-government in India is accomplished. "Must all wait," he exclaims, "until the British monarchy has passed away and India is self-governed?"

THE FIRST STEP TOWARD REUNION.

Concluding that "reunion" as presented by Mr. Carnegie is at present impossible, Major Clarke passes

on to a consideration of some immediate step which might be taken toward practicable union. A basis for present union which will endure, he finds in the common desire of both the United States and England that the ocean routes of the world should be inviolate and inviolable. In other words, he advocates the establishment of a naval union between the United States and Great Britain for protecting the commerce of the seas. The United States and Great Britain alone of nations, he asserts, satisfy every requirement of a true present union. Their instincts derived from a common ancestry, are essentially commercial, and their mutual interests enormously exceed those of any other two nations, the total British trade with the United States in 1891 being over 168,000,000 pounds.

Past combinations of naval forces have never been able to exert power proportionate to their numerical strength for want of full harmony and of mutual understanding. A naval league between the United States and Great Britain, however, "would be powerful far beyond the mere roll of their fighting ships. Sentiment, and the deep mutual confidence which kinship inspires, would confer on this unparalleled union an irresistible moral strength, to which the position and the territorial isolation of naval bases would lend supreme strategical advantage. Again, no two nations have ever yet been fully organized in peace with a view to joint action. Their combinations have been fortuitous and unprepared, their operations enfeebled by jealousy or distrust. The Anglo-American league of peace would exclude any such source of weakness. Scattered all over the world are British harbors, ready to become resting, coaling and refitting stations for United States ships. The Navy Department and the Admiralty would be brought into close communication; the two intelligence departments would exchange information. The distribution of ships in given contingencies would be the subject of joint consideration. A free interchange of ideas as to construction and armament would prevail. Finally, the basis of the league would be essentially democratic; since the welfare of the masses is intimately bound up with the security of sea-borne trade, even though neither democracy has yet fully grasped the fact."

AN ANGLO-AMERICAN COUNCIL OF ARBITRATION.

Major Clarke suggests in conclusion another important first step toward reunion which might be entered upon at once: "We have long grown accustomed to arbitration as the only intelligent method of laying to rest our small disputes; we have not as yet resorted to free discussion as its most natural form. There is a certain indignity involved in admitting the foreigner to intervention in our family affairs. We know each other as he knows neither, and an Anglo-American council could effectively deal with most questions likely to arise. Four members on either side, including the respective highest legal authorities, a president appointed for five years from each nation alternately, continuous renewal of members on the principle

of the United States Senate, and complete dissociation from party politics are the necessary conditions of the constitution of a high tribunal which would command universal confidence. To such a body, meeting once a year, would be referred, by joint consent, all questions not necessarily controversial, but of mutual arrangement; and the misunderstandings which the interchange of diplomatic notes inevitably promotes, together with the friction on the manufacture of which some newspapers thrive, would cease. In the last resort arbitration would still be available. The substitution of personal conference for smart dispatch-writing would mark an era in the relations of the two nations."

WOULD THE ANNEXATION OF MEXICO BE DESIRABLE?

MR. HENRY WARE ALLEN, whom many of our readers will remember as the author of the article "President Diaz and the Mexico of To-day," appearing in the *REVIEW OF REVIEWS*, January, 1893, discusses in the *Arena* the question "Would the Annexation of Mexico be Desirable?" At the present time the desirability of living north of the Rio Grande is so great as to make a vast difference between the land values of Northern Mexico and Southwestern Texas. It would seem, therefore, that an annexation to the United States would be of as great advantage to Mexico of to-day as it proved to the Territories of California and Texas. Mexico is fortunate in having a President and Cabinet whose great purpose is to promote the best welfare of the republic, but she is unfortunate, says Mr. Allen, "in that the ruling class is not inclined to sustain these gentlemen in their efforts for reform. She is unfortunate in having her soil with its vast unearned increment owned by comparatively a few individuals, whose interests the law favors in every way." The chief means of government revenue of Mexico to-day is the custom house tariff, and if Mexico should be annexed to the United States, the question presents itself, how can the revenue which would be lost to both countries through the abolition of the boundary custom house be made good? Mr. Allen argues to show that so far as Mexico is concerned the revenue could be secured by the application of the single tax system in lieu of the custom house.

MEXICO OPPOSED TO ANNEXATION.

Having stated the argument in favor of annexation and pointed out how the tariff obstacle could be surmounted, Mr. Allen goes on to say that it so happens Mexico wants no annexation to the United States. "No greater mistake could be made than for the government at Washington to entertain for an instant the proposition of annexing Mexico. President Diaz rules a people whose traditions, customs, and prejudices are entirely different from those of their northern neighbors. The Mexican people are patriotic, and would resent the protection of any other flag than their own—especially the flag that invaded their country in a war generally conceded to

have been a shame to the aggressive nation. The annexation of Mexico would inaugurate a season of turmoil, friction, and rebellion worse than any Mexico has yet experienced. It would be utterly impossible for the population of Mexico to be successfully governed, directly or indirectly, from Washington. As well might the United States be brought under Mexican rule.

COMMERCIAL UNION DESIRABLE.

"But commercial union," he adds, "is of the utmost desirability. Absolute free-trade is what is wanted, and is all that is wanted, in the way of annexation. Free-trade is all that the annexationists of Canada want, if they only knew it; and the author of 'Progressive Democracy,' in his recent proposition that England and the United States be re-united as one nation, is really actuated by a knowledge of the advantages of free-trade. He resorts to the clumsy expedient of joining the two nations, as he might advocate the annexation of Mexico, because of the cruel consistency that binds him to the fetich of protection—to the theory that as free-trade within a nation is all right, the only way to enjoy free-trade with foreigners is to make them fellow citizens."

MR. WELLS' VIEWS ON THE INCOME TAX.

IN the *Forum*, Mr. David A. Wells, the well-known writer and authority on economic and financial subjects, gives his views on the income tax, which, in short, are that theoretically it is one of the fairest taxes that could be devised, but that taking into account human nature as it exists, this method of raising revenue cannot be successfully administered.

THE ESSENCE OF PERSONAL TAXATION.

The first reason why human nature does not like the income tax, says Mr. Wells, is that it is the very essence of personal taxation. "Notwithstanding the decision of the Supreme Court of the United States that it is not a direct tax, it comes to the taxpayer most directly. The world's experience is to the same effect in respect to a 'poll or head tax.' It is acknowledged to be a direct tax and altogether personal in its incidence. It has accordingly always been most unpopular. Its collection has been the occasion of great civil disturbances in the world's history, and it has been denied a place, by popular vote or constitutional provision, in the tax system of twenty States of the Federal Union.

"A second and more important reason why a general income tax powerfully antagonizes popular sentiment is that its efficient administration, or revenue productiveness, requires that every person liable to taxation in respect to his annual net gains, profits or income shall make to a government official an exhibit of the financial condition of his estate, business or profession; for, in default of such an exhibit, any basis for assessment must be a mere matter of conjecture on the part of the assessor, with a result devoid of any pretense to correctness or equality. But such an

exhibit, necessarily disclosing to a greater or less degree his financial condition to his business competitors and to a curious, gossiping public, no man will willingly make; and he naturally regards it as in the nature of an outrage on the part of a government that seeks to compel him to do it. Hence the successful administration of an income tax involves and requires the use of arbitrary and inquisitorial methods and agencies which, perfectly consistent with a despotism, are entirely antagonistic to and incompatible with the principles and maintenance of a free government."

Mr. Wells then relates the history of our experience with the income tax from 1861 to 1872, concluding that the results scarcely warrant the re-adoption of this method of raising revenue.

THE INCOME TAX IN MASSACHUSETTS.

No State in the union has a more illiberal, all pervading system of taxation than Massachusetts, and no State in the administration of the tax law is more stringent and arbitrary. It would seem, therefore, that what Massachusetts fails to accomplish in the assessment and collection of taxes, it would be of little use for any of the other States or the Federal government to attempt with any anticipation of success. One of the specialties of municipal taxation in Boston, under the provision of its Board of Assessors, is the income tax. Mr. Wells quotes from a recent number of the *Boston Advertiser* an account of the working of this tax, to the effect that, first, comparatively few of the tax payers of Boston make any return to the assessors of their income; second, the fact that there are any returns at all is held to be due to the fact that returns are not open to the inspection of the public, and, third, although the amount annually collected from incomes in the city of Boston—\$840,000 in 1892—it probably represents about one-fourth of what is due the city from incomes. It is hardly to be expected, says Mr. Wells, that the Federal government could administer with a greater measure of success the income tax than it is being done to-day in Boston.

IT WOULD INVOLVE MULTIPLE TAXATION.

Mr. Wells calls attention to several other points bearing upon the proposal to re-enact a Federal income tax, which do not seem to have attracted attention. Such a tax, he points out, necessarily involves multiple taxation on one and the same income, person and property. Citizens in any State would be liable in the first instance to the Federal tax on his income, second, to a State tax on the same income, and, third, a tax upon the property or business producing the income in virtue of its location and consequent territorial jurisdiction of the State.

NOT A PRESENT NECESSITY.

Mr. Wells does not regard the income tax as a present necessity to meet an urgent temporary need. He maintains that from the present rate of taxation on distilled spirits, with a moderate increase of the tax on liquors and tobacco, the Federal government could obtain a revenue sufficient to defray all its ordinary expenditures, including interest on all its debts, and

have in addition a large annual surplus applicable for other purposes. And if in addition slight taxes were imposed upon the importation of sugar, tea or coffee, no other taxes, he is convinced, would need to be imposed by the Federal government.

WHAT ENGLISHMEN THINK OF THE REFERENDUM.

A SYMPOSIUM on the Referendum forms a principal feature in the *National Review*. The papers do not manifest any alacrity on the part of Unionists to jump at the innovation.

Professor A. V. Dicey, reserving statement of its disadvantages, enumerates among its advantages: 1. It may be so used as to make a clear distinction between laws which effect permanent changes in the constitution and ordinary legislation. 2. It would insure that in matters affecting the constitution the country always came to a decision on a clear and plain issue. 3. It gives due weight to the wishes of all voters. 4. It places the nation above parties or factions. Thus it would save the State from parliamentarism or sway of partisanship.

Mr. George Curzon is opposed to the Referendum in England, because: 1. It would involve the grotesque turmoil of a general election whenever the two Houses happened to disagree. 2. When a bill has been seriously amended by the Peers, on which version of the bill is the elector to vote? 3. The House of Commons would become a mere registry for the decrees of a parliamentary tyrant checked only by a haphazard plebiscite. 4. A plebiscite going against a Government bill would be tantamount to a dissolution. 5. Against the Peers would be taken as their condemnation. 6. What would be the position of a member whose constituency voted under Referendum contrary to his vote in Parliament? 7. The two Houses being as at present politically, the Referendum would only be set in motion during a radical Ministry. 8. It is a grave mistake to tempt the electorate to believe in its own infallibility.

Admiral Maxse confesses he is "not keen about it." As the fate of Ministries would depend on the result, the Referendum would be worked on party lines, and the question, "yes" or "no," would be huddled up beneath the usual vortex of issues. Each Referendum would involve the tumult and expense of a general election. He grants one advantage. The country could compel a Government possessing a feeble majority to dissolve.

Earl Grey objects to it that the proper object of a Government, and especially a representative legislature, is not to meet the wishes of the people, but to adopt such measures as are best for the people.

Lord Farrer would approve, if the issue could be put clearly and simply. But this is rarely possible. The question, "Will you or will you not have the Irish Home Rule bill?" involves a most complicated issue. After endless canvassing and wire pulling the real question would be as now, Will you have Mr. Gladstone or Lord Salisbury?

ABSURD EFFORT TO MAKE THE WORLD OVER.

PROFESSOR W. G. SUMNER, of Yale, thus concludes an article on the "Absurd Effort to Make the World Over," in the *Forum* :

"There is one democratic principle which means that every man should be esteemed for his merit and worth, for just what he is, without regard to birth, wealth, rank or other adventitious circumstances. The other principle is that each one of us ought to be equal to all others in what he gets and enjoys. The first principle is only partially realizable, but, so far as it goes, it is elevating and socially progressive and profitable. The second is not capable of an intelligible statement. The first is a principle of industrialism. It proceeds from and is intelligible only in a society built on the industrial virtues, free endeavor, security of property, and repression of the baser vices ; that is, in a society whose industrial system is built on labor and exchange. The other is only a rule of division for robbers who have to divide plunder, or monks, who have to divide gifts. If, therefore, we want to democratize industry in the sense of the first principle, we need only perfect what we have now, especially on its political side. If we try to democratize it in the sense of the other principle, we corrupt politics at one stroke ; we enter upon an industrial enterprise which will waste capital and bring us all to poverty ; and we set loose greed and envy as ruling social passions.

THE FUTILITY OF EFFORT.

"If this poor old world is as bad as they say, one more reflection may check the zeal of the headlong reformer. It is, at any rate, a tough old world. It has taken its trend and curvature and all its twists and tangles from a long course of formation. All its wry and crooked gnarls and knobs are therefore stiff and stubborn. If we puny men by our arts can do anything at all to straighten them, it will only be by modifying the tendencies of some of the forces at work, so that, after a sufficient time, their action may be changed a little, and slowly the lines of movement may be modified. This effort, however, can at most be only slight, and it will take a long time. In the meantime spontaneous forces will be at work, compared with which our efforts are like those of a man trying to deflect a river ; and these forces will have changed the whole problem before our interferences have time to make themselves felt. The great stream of time and earthly things will sweep on just the same in spite of us. It bears with it now all the errors and follies of the past, the wreckage of all the philosophies, the fragments of all the civilizations, the wisdom of all the abandoned ethical systems, the *débris* of all the institutions, and the penalties of all the mistakes. It is only in imagination that we stand by and look at it, and criticise it, and plan to change it. Every one of us is a child of his age and cannot get out of it. He is in the stream and is swept along with it. All his sciences and philosophy come to him out of it. Therefore the tide will not be changed by

us. It will swallow up both us and our experiments. It will absorb the efforts at change and take them into itself as new but trivial components, and the great movement of tradition and work will go on unchanged by our fads and schemes. The things which will change it are the great discoveries and inventions, the new reactions inside the social organism, and the changes in the earth itself on account of changes in the cosmical forces. These causes will make of it just what, in fidelity to them, it ought to be. The men will be carried along with it and be made by it. The utmost they can do by their cleverness will be to note and record their course as they are carried along, which is what we do now, and is that which leads us to the vain fancy that we can make or guide the movement. That is why it is the greatest folly of which a man can be capable, to sit down with a slate and pencil to plan out a new social world."

ORGANIZING ENGLISH VILLAGE LIFE.

THE splendid social part which the "country gentleman" could play, if he would, in frankly accepting and developing rural democracy is illustrated by a valuable memorandum of Mr. R. Ewing on "An Experiment in Local Government in a Village" in the current number of the *Economic Review* (London). The village is Winterslow, consisting of a few detached hamlets on the top of the Wiltshire Downs. "The County Councilor is a country gentleman who lives outside the district, and, in fact, in another county ; but he is our next neighbor, and has always been interested in the parish. He calls himself a Conservative, but he is full of Liberal ideas."

FAMILY GROUPS AND HOLDINGS.

"About two years ago he started a 'Village Committee,' based on the old Saxon idea of 'the Tithing,' as he called it. We have about 190 families (omitting solitary widows) ; these were grouped in tens, and each ten was invited to meet and appoint a committee man. On the first occasion this was done at a tea given by our Councilor, when he explained fully the objects of the meeting. Nineteen were thus chosen : the schoolmaster became their chairman. . . . The members represented every variety of the village life. They chose a sub-committee, representing the various hamlets, and this is consulted by the County Councilor before each meeting of the County Council." Questions as to roads, lighting, nomination of school managers, and of recipients of parish doles have come before this committee.

"The most interesting development of the work of the committee has been in connection with a farm which the County Councilor bought as an experiment in small holdings. The farm contained one hundred and ninety acres : eighty of these were sold to a single farmer, but the rest has been divided into lots varying from half an acre to five or seven acres, and apportioned for sale among the villagers. The system of payment is by yearly installments of interest and

principal combined, spread over fifteen years in half-yearly payments, though any lot can be bought up at a fixed scale, any year. The owners form a 'Landholders' Court, Limited,' which has the duty of collecting tithe and rates, and of giving consent to alienations and buildings on the lots, and which has also the power of investing the profits, after the original purchaser has been duly paid, in any objects intended to benefit the estate as a whole. . . . This interesting experiment was rendered more easy by the very cheap rate at which the property was bought—less than £8 per acre for the freehold—and by the generosity of the County Councilor, who refused to make any profit at all on the transaction, simply taking a small interest and the repayment of his actual expenses. . . . Most till the land, but a few use the smaller holdings as a poultry run.

"The same County Councilor started a pig-insurance club some years ago, which has been very successful. . . . A cow club was also attempted, but too few joined.

"The experiments . . . seem to show that the larger country village, even though much scattered and wanting any central nucleus, is still quite capable of self-government, and in the direction of its own local affairs can sink all political and religious differences."

THE FRENCH VILLAGER.

THE picture of village life in France which a "French official" contributes to the *Contemporary Review* is crowded with facts, and at the same time not lacking in vivid interest. From the great store of information it contains, some points may be taken.

The condition of the laborer is described as in every way much superior to what it was fifty years ago. As a rule his family is not numerous. Military service, which is not unpopular, prevents him marrying before he is twenty-four. Outdoor relief is rare. The workhouse is unknown. "In the rural districts of France nothing is done for the amusement of the laborer, or to improve him morally or intellectually; there are no workingmen's clubs, no concerts or winter entertainments got up by the richer inhabitants for the instruction and amusement of their less fortunate brethren. . . . Nothing is done for the poor except what is done by parish and state."

CIVIC INSTRUCTION.

Owing to the agricultural depression, "the land has no value at present." On the saving of the small landowner for his small family, the writer thinks, "it remains to be proved whether a capital in men is not better for a nation in the long run than a capital in money." Of the village schools, which are free, he says: "The education given in these schools is very good, the teachers being all trained and certificated. The subjects taught are French, arithmetic and mensuration, history and geography (general, and that of France in particular), the principles of morals,

'instruction civique,' which embraces knowledge necessary to every citizen concerning his duties and rights, the administration of the parish, that of the Department and then of the State, the use and election of deputies, etc., and all relating to the manner in which the country is governed; the rudiments of physical and natural sciences, agriculture (theoretical and practical), drawing and elementary music. Girls are taught needlework instead of agriculture. Religion finds no place in the teaching of the schools; parents who wish their children to receive religious instruction send them to the classes held by the priest in the church."

GROWTH OF UNITARIANISM.

To the diffusion of primary schools is largely due the consolidation of the Republic. The workmen and laborers are all Republicans. The large farmers, like their landlords, retain feudal prejudices. The parish councils are often wasteful.

"Old men, women and girls go regularly to church." "But as a rule the new generation of Frenchmen object to what they regard as the absurd dogmas and superstitious practices of the Church of Rome. They have reached a crisis analogous to the crisis reached by the Teutonic race in the sixteenth century. . . . The Protestants are only a small proportion of the population; they are mostly Calvinists and are generally more cultivated; but few are found in the country districts. The form of belief which is gaining most ground in France is Unitarianism, which is professed already by many of the intellectual *élite* of the French nation."

THE STRATEGIC IMPORTANCE OF ASIA MINOR.

AMONG the many excellent articles of the first number of the *Westöstliche Rundschau* is one by Major v. D. Otto Wachs, of Berlin, one of the first military writers in Germany on the subject. Its title is "Kleinasien aus Vogelschau"—"Bird's-eye View of Asia Minor." The article is remarkable for its wide research and thorough discussion of the "Eastern Question" in all its relations, both to the East and to Europe. The writer sets forth the geographical, historical, political and military importance of Asia Minor, and brings before us its ancient classic, apostolic, Christian and mediæval memories. The cities of the Levant, the fortunes of Jerusalem, Rome, Constantinople, and places once crowned with glory and renown, all pass before us. The great question is, Shall Asia Minor remain in its present degradation or be redeemed? "If the signs of the times do not deceive us, the fair region where the 'Seven Churches' were planted by apostolic hands will soon swing round to a new life and a new civilization." As to Constantinople, so intimate is the connection between it and Asia Minor that the one can not be held without the other. So soon as the Greek Cross stands on the summit of St. Sophia and the Russian rules in Stamboul, Asia Minor will become a Muscovite outwork, holding the Mediterranean and affecting the destiny of Europe. A French-Russian squadron could

OUR SECONDARY SCHOOLS.

THE report of the "Committee of Ten" of the National Educational Association, published early in the year by the U. S. Bureau of Education, has attracted wide attention and has received much discussion in the leading educational journals. The committee was appointed in July, 1892, and was charged with the duty of prosecuting researches on the subject of secondary school studies, with the aim of securing a better correlation between these schools and the colleges and universities of the country. The work of the committee was a most important one, and exceeded in scope all previous undertakings of the kind. President Eliot, of Harvard, served as chairman, and in the February number of the *Educational Review* he makes some valuable comments on the report as finally presented.

PERSONNEL OF THE COMMITTEE.

Of the composition of the committee, President Eliot says: "The Committee of Ten was fortunately constituted; for its membership represented the Bureau of Education, the two largest universities in the country—one an endowed, the other a State university,—two comparatively young State universities, a well-established college for women, three public schools, the best endowed preparatory school in the United States, and one of the most influential of the denominational colleges. Four members of the committee had had much experience in public school systems. The East, the West, and the South were effectively represented. Moreover, the members of the committee, taken together, had a large personal acquaintance among the teachers of all parts of the country, both in schools and in colleges."

ITS RECOMMENDATIONS.

Conferences were organized of school and college teachers to consider the proper limits of the subjects taught, the best methods of instruction, the most desirable allotments of time for each subject, and the best methods of testing the pupils' attainments. The recommendations made by these conferences, President Eliot considers very important. The committee itself makes several noteworthy suggestions. "Such are, for example, the declaration that every subject, which is taught at all in a secondary school, should be taught in the same way and to the same extent to every pupil so long as he pursues it, no matter what the probable destination of the pupil may be or at what point his education is to cease: the recommendation that every subject studied at all is to be studied so thoroughly and consecutively that it may provide a substantial mental training; and the suggestions that a certain portion of Saturday morning should be regularly used for laboratory work in the scientific subjects, and that young assistants to the regular teachers should be employed in laboratory and field courses."

SCHOOL AND COLLEGE.

"The committee clearly desired to establish a closer connection between secondary schools and colleges

and, therefore, made a general recommendation to the effect that the satisfactory completion of any good four years' course of study in a secondary school should admit to corresponding courses in colleges and scientific schools. At the same time they make it plain that, in their judgment, a secondary school programme intended for national use must be made primarily for those children whose education is not to be pursued beyond the secondary school."

From Other Points of View.

In the March number of the *Educational Review*, the discussion of the report of the Committee of Ten is continued. Prof. Charles de Garmo speaks of the influence of the report on collegiate education:

"The report will accelerate the reform of the colleges, since it shows that the latter need not inquire so particularly what a student has studied. The college curriculum is now so comprehensive that a student may profitably enter upon a course of higher instruction, no matter upon what phases of the humanities or the sciences the emphasis has been laid in his high school course. Under this enlarged conception of the scope of higher education it is now for the first time practicable to co-ordinate the colleges and the public high schools, so that the educational ladder which has been constructed from the kindergarten to the university in Michigan, Minnesota and other Western States is likewise a practicable possibility throughout the Union."

THE ACADEMIES.

Principal Bancroft, of Phillips Andover Academy, representing the preparatory schools, says:

"The mountain is coming to Mahomet! Schools and teachers who for a generation have been pleading and arguing for relief from arbitrary, shifting and diverse requirements, will feel that at last their contention has received national recognition. Diversity of requirements in the several colleges and scientific schools has been most oppressive to the schools whose pupils have dispersed most widely in their choice of a college, but it has contributed everywhere to the prevailing uncertainty as to what secondary education is, diminished the number of candidates for the higher education, and increased the proportion of candidates who go up hastily and imperfectly prepared. The secondary schools have a right to ask the colleges to agree together as to what constitutes secondary education and a candidate ought to know at his entrance upon college work. Nothing external to the schools would do so much to make them good instruments of education as the adoption by the colleges of the committee's programmes as the basis of all college work. The schools cannot adopt them till they have been accepted by the colleges. The reform is to come down from above. When they are adopted by any considerable number of the best colleges and scientific schools these programmes will appear in the schools, variously modified, no doubt, and gradually improved as occasion demands."

Secondary Education in England.

The *School Review* for March has an article on the present movement for organizing secondary education in England, by Alfred N. Disney, of the Islington High School, London. The subject derives added importance from the promised appointment of a royal commission of investigation. In the light of our American experience, Mr. Disney's account of the condition of things in England is of special interest.

He says, "At present the only thing known for certain about English secondary schools is that they are very few, and many are very inefficient. A government investigation has never taken place. In 1867 a commission inquired into the state of the endowed schools, and the result was that many of them have been reorganized under the direction of the charity commissioners. But the number of these schools is small; they are frequently located where they are not wanted, and only a few are available for girls. If the charity commissioners had in addition to revising their schemes arranged for periodical inspection of these endowed schools, the reform would have been much more valuable. By means of these endowed schools, by proprietary schools, and by private venture schools, the work of secondary education is at present carried on in England, and all these three are subject to striking defects. Their lack of inspection, co-ordination, connection with the elementary schools or the universities, and their numerical inferiority are some of the most striking. There is no *guarantee* for efficiency or even for the healthiness of the buildings. The endowed schools are to a great extent independent of public support, the proprietary schools have to keep their shareholders in view, and the private venture schools are largely at the mercy of the parent's whim. At the same time it cannot be denied that many of all these classes of schools are doing excellent work. The managers of many are actuated by real interest in the work of education. Professional rivalry, school traditions, the voluntary examination and inspection of schools by university examiners, and the need of a certain amount of efficiency to obtain public support operate in various degrees upon schools. But still there is no unimpeachable guarantee that any school is really efficient."

COMMON SCHOOLS AND THE FARMERS.

MR. E. P. POWELL publishes in the *New England Magazine* a protest against the failure of country schools to fit boys for intelligent farm life. He suggests important changes in the instruction given in these schools. "That part of the boy's education which consisted in skillful handling of scythe and ax and other tools is useless and vacated. So far as the three Rs are concerned, they can mostly be taught at home. What we want of our country schools is to make the farming to-day intelligent, interesting and profitable. The boys and girls should first of all be taught the composition of the rocks and soils with which they have to deal. This should be complemented with a good knowledge of plant and animal life. I suppose that no one could be more ignorant of

these things than the average farmer. He is in no case taught in the common schools the structure of the animals he employs, or the grains that he eats. Geography gives a knowledge of the surface of the earth in general; it points away from the farm. Geology gives a knowledge of the earth under foot, the farmer's own immediate property; it makes every grain of sand and every granule of clay interesting; it opens the eyes to ten thousand things the farmer must daily touch and see. Yet the farm children have geography and not geology. No one surely would condemn geography, no one would shut in or circumscribe the farmer's interests; but I plead for the other. Geology I would follow with biology in its forms of zoölogy and botany, and in its divisions of physiology, entomology and ornithology; that is, I insist that our country schools shall undertake to make farmers. The boy on the farm—and the girl quite as much—needs to know the things under his feet and over his head, the soil, the life in and on the soil, and his relation to them. He should understand a cow and a horse in their zoölogical relations, and to some extent anatomically. I am considering the broadening out of farm life, and the awakening of interest in those things that make a part of the farmer's daily life. As the schools are, whatever is taught points to the store and the city, and not to the farm. A college professor said to me, 'We can do very little in the way of putting more science into the college curriculum until the high schools are revolutionized, and that requires a preliminary change in the common schools.' Before the age of seven or eight, in well-to-do families where kindergartens are impossible, the child should be taught chiefly to observe. He should learn to see well and to use all his senses. After that age books should be used as aids to observation; not to dispense with original observation, but to assist. Every child should become an investigator. When this change is made, and the curriculum is re-adjusted as suggested, I do not say that you can not drive our boys away from the farms into trade and manufacture; but I do say that, unless a lad is born with a particular bias for something else, he will love the land so that he will not wish to leave."

The State as the School-Child's Coachman.

The idea of the State providing conveyances and drivers to take children to school may seem to those who share Mr. Herbert Spencer's views like a satire on modern collectivism. It is an idea which has been realized by the State of Massachusetts. Nearly one-half of the municipal areas into which the State is divided have adopted it, and the process has involved an annual expenditure of thirty-five thousand dollars. How this came about is told in an article by Mr. George H. Martin, State Supervisor of Schools, in the *Educational Review*. The general law required that school houses be "conveniently located" for the accommodation of all the children. As population tended to mass in certain centres, it became elsewhere proportionately sparse; and the provision of schools for outlying districts grew more and more

expensive. It was found more economical to concentrate the schools and pay for the carriage of distant scholars. By a law passed in 1869 municipalities were authorized to raise taxes for the conveyance of children. The advantages of concentration have led to a steady increase in this expenditure. One municipality reports: "We had quite a territory fifteen or sixteen years ago containing six districts, each with a poor school house and with an average of, perhaps, ten or a dozen pupils in each. We gradually abandoned these houses and carried the children to the centre, where we had a fine school building. We convey about seventy-five pupils at a cost of eleven hundred dollars annually. We hire teams, not pretentious turnouts, but comfortable. The children are not taken immediately from their homes except on main roads; we do not follow out cross-roads."

A similar report from Concord states: "The natural reluctance of parents to send their young children so far from home, and for all day, to attend the centre school, has vanished. The children are conveyed in comfortable vehicles fitted up for their accommodation. They are in charge of trusty drivers *en route*, and at noon they are under the especial care of one of the teachers, who has an extra compensation for the service."

"The attendance of the children conveyed is several per cent. better than that of the village children, and it is far higher than it was in the old district schools. . . . The children are conveyed from one and a half to three and a half miles. The cost of transportation is about forty dollars per week. It is estimated that it would cost sixty dollars a week to maintain schools in all the districts."

THE PLACE OF UNIVERSITY EXTENSION.

PROF. SIMON N. PATTEN, in the February number of *University Extension*, aims to discover the philosophical basis and justification of this educational movement. After a survey of the various forces active in our educational world, Prof. Patten concludes that the field of education is divided into three parts: preparation of the boy for industrial life, preparation of the adult for citizenship, and preparation of the scholar for specialized work. The boy and the scholar, he thinks, are provided for, but the citizen is neglected. "The school teacher and college professor have clearly defined duties and recognized means of fulfilling them. What are the functions of the third kind of teachers? How can they act efficiently, and what shall we call them?"

TO MAKE CITIZENS.

"The University Extension movement seeks to answer these questions and to create a clearly defined agency, co-ordinate with other educational forces, which will do for the citizen what the school does for the boy, or the university for the scholar. It does not desire to make up for the deficiencies in boys' education by a kind of night school, nor to give to busy adults that specialized knowledge which is the func-

tion of the university. However fully the school and university may fulfill their recognized duties, there remains a field of equal importance for University Extension. In fact, the more fully they perform their functions, the more clearly will the field of University Extension be defined, and its need felt. Elementary knowledge, specialized knowledge and race knowledge are distinct in kind, and require special agencies for their preservation, promotion and enlargement."

RACE KNOWLEDGE.

By "race knowledge," Prof. Patten means "that related, practical knowledge which enriches and enlarges the life of the citizen." He complains that the present system affords no means of acquiring such knowledge. "No educational agency impresses the functions of citizenship, or has as its end the elevation of national character. The school drills the boy in the elements of knowledge, and relies upon the indirect effects of this knowledge to mould his character. It is assumed that if boys become efficient producers, their interest will be with the State and make them good citizens. This is a crude utilitarian attitude, which has no basis in the facts relating to the history of our civilization. Good citizenship is not due to material interests, but to the instincts, feelings and ideals, which are a part of our race inheritance. It is often forgotten that political instincts and national character were formed before the era of boy education began. Our present educational methods are not more than two centuries old, and have become efficient only in this century. Our political instincts, however, are centuries old, and are too firmly imbedded in the national character to be materially weakened in so short a time by a change in the character of educational methods. Our present race knowledge also was largely acquired and its effects in social institutions and ideals fully realized while adult education was still one of the conscious forces of our civilization."

THE WORK OF LECTURERS.

Prof. Patten proceeds to show that in earlier times the universities and colleges, through the living personalities of great teachers, did much to extend race knowledge and form national character. Other agencies to this end were the instructions of the clergy and family life; but these influences have been largely displaced by the extension of elementary instruction which is lacking in the vital force characteristic of folk-lore and other forms of race knowledge.

"Both the university specialist and the Extension lecturer are engaged in adult education. They are also similar in that they are discoverers of new truths as well as teachers of the old. The specialist isolates and analyzes phenomena and discovers new processes for investigating them. He adds new facts to what is known and increases our theoretical knowledge. These facts and theories are purely objective and show only the external relations existing between things and events. The lecturer, however, must

take these facts and theories and discover the relations existing between them and the bodies of knowledge already assimilated by his hearers. The subjective unity of facts and events does not follow of itself upon the discovery of their objective relations. Things may lie isolated in the mind which are bound together by the strongest objective ties, or on the contrary, a vital connection may be felt between ideas which have no objective relation. It is the function of the lecturer to develop the logic of conviction and to use it rather than formal logic in creating a vital relation between the facts he wishes to impart to his hearers and their previous knowledge. He must leave these facts in their minds, not as mere facts, but as part of their organized race knowledge."

"It is evident, therefore, that university work divides itself into two portions, needing for its execution two distinct types of men—the specialist as explorer and expounder of objective facts, and the lecturer as popularizer and creator of race knowledge. The work of one must be confined largely to the great centres of learning, where the proper facilities for work and study are to be found; the other must come into direct contact with the public and carry to it the best products of our civilization. The university without efficient local organizations through which to impart culture to the adult population is as defective as the church would be, having theological schools or religious papers, but no local organizations or pastors."

A NEW EDUCATIONAL AGENCY.

After discussing the various differences between the work of the college professor and that of the Extension lecturer, referring particularly to the diverse needs of pupils and to peculiarities of environment, Prof. Patten concludes: "There is, therefore, a great present need of an educational agency to secure these results. University Extension must do for general history, recent events, and the enlarged national environment what oral instruction did for the local events and surroundings. The new environment must be related to the citizen, visualized and made concrete and objective. National institutions, cosmopolitan ideals, and a new morality must be made as vivid and real as were local forces they displaced. Not merely a county or a State, but all Europe and America must be put in concrete relations to each citizen. He must be made to realize his present social relations and feel as much in touch with distant events and places as with those of his own locality. Intensity and objectivity will then be restored to the emotions, instincts and ideals of the subjective environment, thus giving them once more a dominant place in the national character."

American Society for the Extension of University Teaching.

The *Bulletin* of February 16 gives a survey of the work of this organization during the year 1893. The general results are reported as favorable, notwithstanding the business depression of the latter half of the year, whose effects reacted disastrously on most

branches of educational and social effort. A new agency in the work of the society was established during the year in the form of a summer meeting. It is believed that this annual conference will prove of great value to the cause as a whole. All the branches of the work already begun by the society were continued during the year. The Extension Seminary was conducted for the benefit of workers in the field; the publication department has brought out a number of technical works embodying the experience of the movement to date; the lecture courses given were successful both in point of attendance and in stimulating systematic work. Some effort has been made to reach the working people with these lectures, and there is gratifying promise of success along this line. The society further reports the first systematic attempt to help the foreign born citizens of Philadelphia to qualify themselves for the duties and privileges of their new citizenship. Lectures were given in the Russian Jew quarters of the city, and were well attended. Some work has also been done among the colored people.

A LATIN PLAY AT HARVARD.

IN view of the approaching production of the "Phormio" of Terence, by Harvard students at Sanders Theatre, Mr. Morris H. Morgan contributes to the *Harvard Graduates' Magazine* a brief description of the stage arrangements of the Romans as they are to be reproduced at Sanders April 19:

"In the Roman theatre the *scaenae frons* was an elaborate structure, often with three stories of architecture, and decorated with pillars and statues. Ours has its decorations,—carvings, and the arms of the University, and under them the seats of state of the President and Fellows. Half way up the wall is the music gallery, its curved base projecting over the stage and serving as a sounding board somewhat after the fashion of the roof over the Roman stage at the top of the wall. There was of course no gallery here in a Roman theatre, but the music gallery is part of the architecture of ours. When a play was presented in a Roman theatre, it seems likely that the scenery did not extend all the way up to the top of the *scaenae frons*, but that it covered merely the lower portion, perhaps only the first story, leaving the architecture of the upper stories perfectly visible. And so it is our intention that our scenery, colored models of which have already been made, should extend only up to the base line of the music gallery, leaving the gallery and the inscription above it visible. The scene itself represents the fronts of three houses, and all the action takes place in the street before them. The curtain in the Roman theatre was not raised at the beginning of a play, but fell into a sort of box under the stage. There is no curtain in Sanders, and we must have one made which will fall on the Roman principle. The scene painted upon it will be a copy of the famous relief in the British Museum in which the god of the theatre, Dionysus, comes with his train to supper with a dramatic poet."

MARVELS SCIENCE HAS IN STORE.

MR. PEARSON'S pessimistic lament that all the great discoveries of science have been made has roused Lieut.-Colonel Elsdale to discourse with exhilarating buoyancy, in the *Contemporary*, upon "The Scientific Problems of the Future." He declares that new discoveries will crowd thicker upon the world in the twentieth than in the nineteenth century. Out of the possible legion he selects four.

THE CONQUEST OF THE AIR.

"The conquest of the air is the first." Already navigable balloons are being prepared by the French War Office which are expected to go at the rate of twenty-five miles an hour. Failing the sudden invention of a true flying machine, the writer anticipates a progressive development of this class of balloon. First, the gas will have simply to sustain the weight; the lifting power will be supplied by the addition of air screws. The air screw or propeller will gradually predominate, until it does the work of wings, and the balloon is rendered superfluous. The flying machine was fourteen years ago, in the then condition of mechanical science, demonstrably impossible; but if the present rate of progress be maintained for another fourteen years, it will have become actual. The flight of birds and the general laws of aerial locomotion have been carefully studied.

THROUGH THE AIR AT ONE HUNDRED MILES AN HOUR.

If competent and practical engineers would apply themselves to the problem it would soon be solved. The "vital issue" is to achieve "stable suspension in the air." "Once let the flying machine be stable, strong, safe, and powerful enough for its work, and it will represent the safest kind of locomotion ever invented. . . . The revolution made in locomotion by the flying machine, whereby we shall be able to run from London to New York in perhaps from thirty-six to forty-eight hours, and from London to Paris and back between breakfast and luncheon, will be at least as great as that caused recently by the introduction of railways and steam navigation. . . . The machines will run at a tremendous pace, probably up to or even exceeding one hundred miles an hour."

MODEL THE SHIP ON THE FISH.

Marine navigation is to be transformed. At present engineers seek to gain increased speed by developing the locomotive power. The writer suggests they are all on the wrong tack. They ought to study "the way of the fish in the sea," and to discover why the torpedo requires such enormously greater power to propel it than does the porpoise. He finds the reason of the difference in "surface or skin friction." This causes the larger half of total resistance to a ship's movement. We need to learn the secret of the coating of the fish. Smooth steel forms about the worst surface possible. He thinks that compressed paper faced like the skin of a shark might serve. He sug-

gests that the Admiralty should grant two or three thousand a year to experiments under a competent authority. The resistance due to wave-action might be obviated by a vessel of the American whale-back type. Ocean steamers might with present motor-power run fifty knots an hour.

THE BETTER UTILIZATION OF COAL AND GRASS.

How to get the power out of coal without burning it, or rather, how to bring coal into such a condition that on conjunction with the oxygen of the air it will supply us with electrical force, is a problem the writer expects to be soon solved. He is also hopeful of chemical and medical science making the vegetable foods—notably grass—digestible by man without first passing through animal intermediaries. An enormous increase of our food supply would be the result.

A GIGANTIC SEARCH LIGHT.

EVERY one who attended the World's Fair remembers the large electric search lights which at night shot their beams across the grounds, and out over the lake. In *Cassier's Magazine*, Mr. H. M. Norris, of the American Society of Mechanical Engineers, tells how the largest of these lights was constructed and describes the method of operating it.

This search light is the largest and most powerful one in the world. The drum is ten feet six inches high, and the total weight is about six thousand pounds. It is so perfectly mounted and balanced that a child can move it in any direction. The reflecting lens mirror used is sixty inches in diameter and three and one-quarter inches thick at the center, and one-sixteenth of an inch thick at the edges, weighing about eight hundred pounds. Inside the drum of the search light is an electric lamp, the maximum current of which is two hundred ampères, and at this point the lamp has a luminous intensity of from 90,000 to 100,000 candles, and the reflected beam a total intensity of 375,000,000 candles. How far the powerful beam of light of this instrument can be seen is difficult to state. The search light recently set up on Mount Washington in the White Mountains, having a diameter of only thirty inches, and a reflected light from the mirror of 100,000 candle-power, could be seen from points one hundred miles away, and a newspaper could be read in its beam ten miles away. During the months in which this light was in operation, it was frequently used in sending messages to different points, the messages being sent to the mountain for verification by means of the ordinary telegraph. Portland, Maine, a distance of over eighty miles, was thus communicated with several times.

The uses to which the search light can be put are constantly increasing. Communications written in stencil upon sheets of tin can be used as lantern slides in the larger sizes of projectors, which, thrown upon the clouds as upon a huge canvas, can be easily read a mile or two away. As an aid in ship navigation its

value is inestimable, although at the present time lamps of the higher candle power are mainly used upon decks of men-of-war, forming an important factor in the fighting efficiency of these vessels.

FLYING À LA ALBATROSS.

ONE Herr Lilienthal, of Berlin, has invented a flying machine, similar to that devised by the lamented Darius Green, but which enables the human bird to alight rather more gracefully. The German Darius' experiment with the perfected machine is thus described in the *Leisure Hour*:

"Avoiding anything like competition with the fully developed wing-power of birds, this experimenter has begun with the safer and more elementary feat of soaring on 'the wings of the wind' which we so much admire in certain birds—in the swallow, the hawk, and the albatross. . . . He has made

SLIDING DOWN A DECLINE OF FIFTEEN DEGREES.

diagrams of the direction of the wind blowing over a plain, and has found this direction to be an up-gradient of three degrees. His idea is that the motion of the lower regions of the air is retarded by friction against the earth. In this and other ways, the wind does the necessary work for soaring birds.

"The accompanying illustration, which is a reproduction of an instantaneous photograph taken in Steglitz near Berlin, shows the way in which he slides down a slight decline of ten or fifteen degrees. The wing surface is forty-five square feet. It is not safe to use a larger surface before having tried to manage a smaller one. He takes a sharp run of four or five steps before the wind, jumps into the air, and floats down a gradient of about seven hundred and fifty feet in length—a very fair flight to begin with. By shifting his centre of gravity (*à la* albatross) relatively to the centre of resistance, he can give the wing surface any amount of inclination; he can, in

fact, to a certain extent, either slide down, move quickly, or slacken the movement, or alter his direction."

CABLE CARS VERSUS HORSE CARS.

IN the March *Scribner's*, Philip G. Hubert, Jr., has an interesting paper on "The Cable Street Railway," in which striking half tone views are given of the New York Broadway cable system, its power house, etc. Of the relative cost and advantages of horse cars and cable cars, Mr. Hubert says:

"From the reports made to the *Street Railway Journal* it was computed that the average operating expenses, taking the figures of a dozen cable roads, are 8.4 cents per car and per mile. The operating expense upon the average horse car line is said to be 10.2 cents, which shows a saving of less than twenty per cent. In large cities, however, the results are more favorable to the cable than this. The average cost of construction and equipment of a cable line in a small city is put by experts at \$175,000 a mile. For a city like New York such figures have to be doubled.

"The first outlay for a cable plant is of course enormous as compared to a horse car road, but the deterioration is insignificant. Steam engines and driving machinery last a lifetime, while the hard work required of a car horse uses the animal up in less than five years. Another item of saving is in the wages of stablemen and hostlers. Wherever a machine can be made to do the work of a man there is a saving, and the force of men now required at the power houses of the Broadway road in New York City to run the machinery is only one-eighth of what it used to be when horses were used. Still another advantage is in the smaller quarters required. A building half the size of the old stables will contain the boilers and engines required for the cable. The enormous stables of the big horse car lines have long been a menace to the city on account of the danger from fire, and a source of foul odors at all times. The carting through the streets of vast quantities of manure from the stables is also done away with.

"There is also one advantage which the cable road has over horse cars that few persons not familiar with the subject realize. Both cable roads and horse car roads have to be prepared at all times to carry an exceptionally large number of passengers. During certain hours of the day the business requires four times as many cars as at other times; then upon occasions of public ceremony, parades, celebrations, etc., the whole force of cars may fall short. In order to be ready for such emergencies, both daily and occasional, the horse car road has to keep in readiness a large number of horses, probably twice the number required for the average work of the road. And of course the car horse costs as much to keep in idleness as when at work. With the cable roads a greater demand means simply more steam, more coal to be shoveled into the furnaces. Finally, the cable roads expect not only to save money in the ways I have indicated, but they expect to receive a larger income than from horse cars because of the better service

offered to the public. They expect to attract customers from the elevated roads and the horse car lines, and they are probably justified in so doing."

ELECTRIC CARRIAGES.

THE electric street car is quite a familiar institution. Electric railways have long ceased to be a novelty. The prospect of running carriages by electricity, and of filling our thoroughfares with swiftly-moving horseless vehicles, is now said to be drawing perceptibly near. A well-known French electrician predicts that even before the end of the present century Paris "will have become a paradise of electric coaches." *Cassier's Magazine* announces that, of many recent efforts made in this direction by French enterprise, "the latest outcome is a carriage, designed by Paul Ponchain, of Armentières, with which most satisfactory results are said to have been recently obtained."

"It has seats for six persons, and electric power is furnished by Dujardin batteries, arranged in six groups of nine cells each. . . The batteries are carried in a large box, coated with asphaltum, and careful provision has been made to avoid spilling the solution. A suitable controlling switch enables the making of various combinations among the batteries so as to make different working speeds possible. The motor is a Rehniewski machine of 2,000 Watts capacity, capable, in case of need, of developing double that amount of power for a short time. The power is transmitted to the rear carriage axle by link belts and sprocket wheels. Steering is effected by a hand wheel attached to a rod, the lower end of which moves the axle by means of bevel gearing. The electric measuring instruments, switches for lighting the three lamps with which the carriage is equipped, and a reversing switch are carried on the dash board. The service weight of the whole outfit is about 3,000 pounds, and one charge of the batteries is said to be sufficient for a 44-mile trip on a paved street at a speed of about 10 miles an hour."

The writer thinks that "progress in storage battery development" has been of late so encouraging as to warrant large expectations of its speedy commercial success in the uses specified.

THE ZULUS.

MISS ANNIE RUSSELL concludes an article on the Zulus, in *To-day*, as follows:

"Of all the races of South Africa the Zulus possess the strongest characteristics. They are of fine physique, and their mental endowments have been universally testified to as remarkable. They are full of a genial humor and ready at repartee. They delight in argument and display great rhetorical force. They raise quibbles with a deftness that only falls short of art, and has often excited the comment that they would eminently adorn the legal profession. Of their language it has been said that it is characterized by extreme refinement, and in its precision of grammatical forms and facility for making compound words it is scarcely inferior to the Greek."

NATURAL SCIENCE IN JAPAN.

ONE of the best reviews of scientific progress is *Natural Science* (London), which was founded just two years ago. A notable series of articles on "Natural Science in Japan," by Mr. F. A. Bather, has been running in the January, February and March numbers, and the following extracts will show how interesting are the articles, and how much care and trouble have been bestowed on the subject.

LOVE OF NATURE.

"Few people in this world have the love of nature so strongly inborn in them as have the Japanese. It pervades all their life—religion, art, poetry, daily pursuits, and holiday recreations.

"Art, not the conventions of the schools and the copies of Chinese masters, but the living naturalism started by Okyo and perfected by Hokusai—how it sports with and idealizes the minutest facts of this natural world! Natural, this art is in its irregularity, even in its impossibility, and above all in the life with which it is instinct. It is not the remote or the grand that inspires these artists, but the near, the quaint, and the beautiful.

"Poetry, with all its conventions, and they are neither few nor easy, is for the Japanese almost entirely an impressionist rendering of nature. Sometimes a mere sketch, that appeals to one solely by its beauty; sometimes a piece of such sympathy with the soul of things that its subtlety and delicacy perpetually charm while they perpetually elude us.

"If there is one thing characteristic of the Japanese, it is their love of flowers. No house in Japan so small but has its little landscape garden, if only in the back yard; and no inn so humble but can find a flower to brighten the room of every guest. The love of animals, though not perhaps quite so conspicuous, is nevertheless sufficiently obvious."

MODERNIZATION OF JAPAN.

The love that these children of nature have for their mother is now abundantly exemplified. But this feeling is in no way connected with the scientific spirit. At last, however, the scientific spirit, with such other modern improvements as quick-firing guns and labor disputes, has invaded the land of the rising sun; and it is the object of Mr. Bather's paper partly to trace its gradual growth, and partly to show how it flourishes to-day.

"The modernization or Europeanization of Japan has been a purely defensive measure, initiated and carried on by a certain section of the Japanese themselves, and notably by their great statesmen, the Counts Ito and Inouye. But the actual working out of the scheme has of necessity been placed, till recently, in the hands of foreigners employed by the Japanese government. In this development two great races, the Anglo-Saxon and the Germanic, have played prominent parts. The English speakers have devoted themselves to the more practical and obviously utilitarian side of life, embellished, as usual, by the attempt to impose on an alien people their own

particular religious opinions. To them are due the railways and the College of Engineering, the Navy and the Mint, the Press and the Prayer-Book.

"The Germans, on the other hand, have exerted their influence chiefly in the direction of history, medicine and the natural sciences. It is to the labors of such men as Engelbrecht, Kaempfer, C. P. Thunberg, P. F. von Siebold, Edmund Naumann and Max Fesca that the present position of natural science in Japan is largely due.

NATURAL SCIENCE IN THE PAST.

"Kaempfer, a Westphalian, came to Nagasaki in 1651, being then thirty-nine years of age. He stayed in Japan two years and two months, during which time he was, like other foreigners, practically confined to Deshima, an island district of Nagasaki, except on the two occasions when he attended the Dutch embassy on its yearly visit of homage to the Shogun's Court at Yedo, now Tokio. In spite of the disadvantages under which he labored, he collected a vast amount of information, subsequently given to the world in his *Amœnitatum Exoticarum Politico-physico-mediarum Fasciculus V.* (Lemgo, 1712), and in the *History of Japan*.

"In Kaempfer's time a knowledge of natural history seems to have been very sparingly diffused among the Japanese. Monsters, indeed, they were well acquainted with, but animals of a less exalted type appealed to them in a very small degree.

"Over a century elapsed before another man of any scientific importance found his way to Japan. At last, in August, 1775, C. P. Thunberg, the Swedish entomologist, came as physician to the Dutch Legation, and he stayed in Nagasaki till December, 1776. He was not idle during his visit and the results are to be found in several volumes. Besides making researches on his own account, Thunberg instructed some Japanese in various branches of natural history, especially botany.

WHAT A GERMAN ACCOMPLISHED.

"Again we pass over three-quarters of a century before the arrival of the greatest German of all who have visited Japan. Philipp Franz von Siebold landed at Nagasaki in August, 1823, and by force of character, by urbanity of manner, by skill as a physician, even by a system of bribery which fell in with the customs of the country, and which surely, under the circumstances, no sensible man of the world will condemn, he obtained an extraordinary hold over the Japanese, suspicious and intractable as they then were. Suddenly a rumor got about that the chief Court spy had sold him a map of the country. This was treason according to the old Japanese law. Siebold was cast into a dungeon, from which he emerged only on January 18, 1830, with strict orders never to return to Japan.

"Siebold noticed, among other characteristics of the Japanese, their love of the monstrous, the keen eye united with the cunning hand, and the practical bent of their minds. Botany, he says, was especially cultivated by them, partly for its service in the phar-

macopœia, partly since they depended on the vegetable kingdom for almost all the necessities of life, in the way both of food and clothing. For their own pleasure and for the ornament of their houses they cultivated the rarer plants.

"The study of zoölogy had prospered less; for investigations into the qualities of animals seemed to this herbivorous nation less necessary and useful than into those of plants. They had a very accurate knowledge of such animals as happened to be of any use to them, especially of fish, crustaceans, shell-fish, and certain other molluscs. They often formed collections of shells, and made various articles out of them. In all their collections they valued a thing the more for its monstrosity. It was the same with geology."

The mere mention of the various scientific institutions of Japan is enough to show how enormous the advance of the last quarter of a century has been. They are the College of Science of the Imperial University at Tokio, the Geological Survey, the Imperial Museum at Ueno Park, the Learned Societies, and various other educational bodies that have for part of their task the dissemination of natural knowledge.

WOMAN SUFFRAGE IN NEW ZEALAND.

IN the United States, woman's participation in the suffrage is an accomplished fact in Wyoming and Colorado, and to a limited extent in Michigan, Kansas, and (as regards school questions) in several other States. Americans generally have had no more experience under any system of women's voting than have the English. We are watching with interest the progress of the movement to grant women the franchise in some of the British colonial governments. An account of the first election in New Zealand at which women used the ballot is given by Mr. R. H. Bakewell in the *Nineteenth Century*.

"At nine precisely, the polling places throughout the colony were opened, and here in Auckland the women were the first to enter. Only six are allowed at a time in each polling place, but by a liberal interpretation of the law there may be several polling places in one building. There was no confusion, no cries or jeers or interference of any kind with the voters, and very little more excitement than at an ordinary election; that is, not half so many people about the streets as on Sunday afternoon when the children are going to Sunday-school, or on Sunday evening when the people are going to church. Perhaps a few more women were walking about than are usually to be seen in the morning. Cabs and carriages arrived constantly at the polling places with 'lady voters.' All went on just as if the women had had votes as long as the colony had had responsible government.

"During the whole day not a single drunken man was to be seen anywhere, and the women passed to and from the polling places without any annoyance, and with only the inevitable but extremely courteous solicitations of the canvassers for the different candi-

dates. As I never saw an election in England since the Ballot, I do not know what particular plan is adopted; but ours, which is used all over Australasia, is simplicity itself. The voter goes up to the returning officer, mentions his name, and waits for a ballot paper. As soon as the name is found on the roll the returning officer writes the number it bears on the roll, on a corner of the ballot paper, which he then turns over and gums down. The voter takes his paper

MRS. YATES, MAYOR OF ONEHUNGA.

to a temporary screen, where there is a desk and pencil (which is tied to the desk). The paper contains the names of all the candidates, printed in alphabetical order. The voter then strikes out the names of the candidates he does not intend to vote for, folds the paper, and in the presence of the returning officer places it in the ballot-box."

"A DREADFUL OBJECT LESSON."

Mr. Bakewell's views as to the results of this first election are doleful indeed.

"It seems to be the general opinion that, whatever may be the changes made in the *personnel* of the Ministry, the colony is now committed for three years to a course of extreme Radical legislation. The Opposition is powerless. All the most powerful members have either been defeated, or, like Sir John Hall, have given up politics. We must trust to beer and the banks to save us from absolute ruin. The men elected are nearly all, with only one or two exceptions, of the most uneducated class in the community, either the lowest bourgeoisie or mere carpet-

baggers. They have displaced men of education and experience. Such are the results of the Female Franchise! It is to be hoped that it will be a warning to English Conservatives. We shall probably for some years to come be a dreadful object lesson to the rest of the British Empire,"

Mrs. Fawcett, in the *March Contemporary*, ridicules Mr. Bakewell's deductions, and asks the British public to suspend judgment till further information can be obtained.

Mrs. Yates, who has been elected to the chief magistracy of Onehunga, in New Zealand, has the distinction of being the first woman mayor in the British Empire, and, says a writer in an Australian review, "on the occasion of her installation she bore herself with great dignity."

WHY WOMEN OUGHT NOT TO WORK.

"THE problem of woman from a bio-sociological point of view" is treated by Signor G. Ferrero in the current number of the *Monist*. "The essential condition of feminine existence," which he desires to analyze in his paper, is that which he names "the Law of *Non-Labor*." "As it is a natural law that the man must labor and struggle to live, so it is a natural law that the woman should neither labor nor struggle for her existence. Biology clearly shows us that the physiological prosperity of species depends on the division of labor between the sexes, for in exact ratio to this is the duration of life." Marriage, as found among the higher animals, is "a perfected form of the division of labor and mutual co-operation of the sexes." During hatching time the male bird does all the providing for his brooding mate. At other times her functions in seeking food are merely auxiliary. Similarly with lion and hyæna. The fearful toil which falls to the savage woman, the writer pronounces to be "merely a passing phase, a very dangerous aberration, produced by the excessive selfishness of man, which does not and cannot last long." He remarks that the races in which it is found "have remained in a savage state and have made scarcely any progress." In civilized nations "female toil is not necessary for the production of the wealth needed for humanity."

"Man alone could do this. Woman labor only tends to lower the marketable value of male labor; for, while woman is working in the factories, there are everywhere, and especially in Europe, crowds of men vainly seeking employment, to whom the cessation of work is an oft recurrent and terrible evil. This shows that, even from a sociological point of view, female labor is a pathological phenomenon.

"Statistics show us an increase of mortality among women and children in countries where industrial life has pressed mothers into its ranks.

"A perfect woman should be a *chef d'œuvre* of grace and refinement, and to this end she must be exempt from toil. . . . The working woman grows ugly and loses her feminine characteristics. . . . Womanly grace, and the love which men bear a beautiful woman, have perhaps been the origin

of paternal love, and of all the other sweet and tender feelings of which the male is capable. Grace is the æsthetic side of weakness.

"Woman more than man enjoys all the benefits of civilization, which nevertheless have been in great part acquired by him alone. . . . Man labors and toils to-day just as he did of old, and there is nothing abnormal in this fact, for it is his positive duty. What advantage, then, can be gained by participating in man's struggle for existence, when woman has only to wait until he places these benefits at her feet?

"I cannot understand why the question of woman suffrage should so excite public opinion. It is entirely profitless to her. . . . If her husband strains every nerve already to provide her with all the luxuries of life, he will certainly not be lax in defending those interests which are identical with those of his family."

WOMAN IN CLUBLAND.

UNDER this title the Hon. Coralie Glyn contributes to the *Humanitarian* a lively sketch of several women's clubs in London. She avers that "women's clubs have, despite all prophecies to the contrary, become not only a fact, but even a factor, in the intellectual life of this latter end of the nineteenth century" and that of the majority of the well and carefully organized women's clubs throughout Great Britain, the record has been one of "gradual, but steadily increasing, growth."

"Perhaps in London among some of the best known clubs may be cited the 'Alexandra' and the 'Pioneers,' the 'Writers,' and the 'Victorian,' and the 'Somerville' and the 'University.' To the 'Alexandra,' which heads the list numerically, belongs likewise the honor of being one of the earliest established.

"The 'Writers' Club, which has its habitation in Fleet street, has not been founded many years, but, aided by the unceasing efforts of Lady Jeune and of Mrs. 'John Strange Winter,' it has flourished exceedingly, and is now on the lookout for more extensive premises. It forms the 'happy hunting ground' of many of the leading journalists of the day."

In the East end of London also, the writer reports, clubland is thriving greatly. "The success which many of these working women's and girls' clubs have attained has in some cases exceeded even the most sanguine expectations. One of the first founded was that organized by Miss Stanley in Greek street, Soho, and this club proved to be the parent of over twenty subsequently established ones. The Soho Club (for working girls) is open every week-day from seven till ten o'clock, and also on Sundays. Its entrance fee is one shilling, and its subscription two shillings per quarter. A coffee bar is open every evening, and members can also procure tea and dinner."

Women's Clubs in Washington.

Emily L. Sherwood, in *To-day*, makes a running commentary on several of the more prominent of these organizations. Washingtonians themselves may

well be amazed at the number and diversity of interests represented by the literary and social clubs of their city.

"Even the society woman often has another, deeper, fuller side to her character, and nothing proves it more conclusively than the many women's societies in the city, in which she takes her share of interest as a member or otherwise. But few women, perhaps, pause to consider or give credit to the originators of this new régime. Those who have for years fought the battle for woman suffrage have had everything else in the way of opportunity granted, save only what they have asked for. Besides the oldest of them all—the Woman's National Suffrage Association—there is the Woman's National Press Association; the Woman's Historical Society; the Woman's Anthropological Society; the Woman's Washington Social Club; the Pro Re Nata; the Daughters of the American Revolution; the Colonial Dames, and the Women of the Relief Corps and Loyal Legion of the Grand Army."

There are also several clubs in which men and women stand on an equal footing, such as the Shakespere Club, the Travel Club, the Unity, and the famous Literary Society, which limits its membership to forty, actual residents of the city, and an honorary list of ten.

THE BEATIFICATION OF JEANNE D'ARC.

"THE aspirations of many a lover of purity and patriotic valor," says the editor of the *Catholic World* in the March number, "will be gratified by the intelligence that the Congregation of Rites have just found that the case for the beatification of Jeanne D'Arc has been proved. The evidence has long been in process of sifting, and a special meeting was held at the beginning of February to put the question to a vote. Cardinal Parocchi went over the whole case in an exhaustive speech, detailing the proofs of the miracles attributed to the Maid of Orleans and dilating upon her extraordinary virtues, her childlike innocence and simplicity, and the wonderful story of her behavior before the executioners who called themselves her judges. There are in existence, fortunately, the most ample records of her trial (so-called), as also a detailed report of the rehabilitation proceedings which took place about thirty years subsequent to her execution, at which latter many of the witnesses at the original indictment were re-examined, and the documentary evidence, which has been kept with the utmost care, is extraordinarily clear down to the smallest verbal detail. The Pope, acting on the report of the Congregation, now gives leave for the introduction of the process of beatification, using, according to immemorial custom, his baptismal name of Joachim, reserving his pontifical name for the following decrees. The members of the Congregation of Rites present on this memorable occasion were Cardinal Aloisi-Masella, Prefect of Rites, and Cardinals Parocchi, Bianchi, Melchers, Ricci-Paracciani, Ruffo-Scilla, Mocenni, Verga, Macilla, Macchi, and Langenieux."

'A LADY OF ENGLAND.

IN *The Church at Home and Abroad* appears a sketch of the late Miss Charlotte Tucker (A. L. O. E.), from which we quote the following paragraphs :

"The letters, 'A. L. O. E.," says the writer, "would make a real word if they were written close together, but those little dots spoil them for any good spelling and show that each letter stands for a separate word. I have heard two explanations of the letters—that they might mean 'A Lover of Everybody' or 'A Lady of England.' I believe that the second explanation is the right one, but either of them would describe the good woman who always used those letters as her signature, and who died in India December 2, 1893. Her real name was Miss Charlotte Tucker and she was a Lady of England, having everything that money could buy to make her home and her life comfortable and happy. But she was so truly a Lover of Everybody that she was always anxious to help every one whom she could reach to be good and happy.

SHE WROTE FOR BOYS AND GIRLS.

"Among the people whom she loved and worked for were the boys and girls of England and America and she wrote a great many books to interest and help them. Perhaps you will find some of them in your Sabbath school library, and if they seem to you a little dull and old-fashioned beside the many newer and fresher books that are written in these days, I am sure that you will believe that the kind woman who wrote them had a heart very full of love for her young readers, and I do not doubt that many of them were helped by her books to overcome faults that have not gone out of fashion yet.

"But when Miss Tucker was fifty-four years old, so old that most of us would have thought that we could not undertake a new life and a new work, she decided that she could not stay in England, where there were so many good earnest people to do the work, but that she would go as a missionary to India, where she had lived for a few years when she was a child, and do what she could to help the people of that heathen land to understand about Christ and to love Him. For eighteen years she has been doing such work, living a simple, quiet, godly life, using her money and her strength for the people among whom she lived.

A PROLIFIC WRITER.

"She learned two languages and wrote more than one hundred books and tracts for the people of India ; she visited the Hindu and Mohammedan women in their homes, telling them of the love of Jesus and of the home in heaven that He has prepared for them ; in the Boys Boarding School at Batálá she knew every boy and was always ready with her advice and sympathy. Some one said to her, 'I never saw her for even a short time, without getting some good and helpful thought to carry away with me.'

"But at last the strength that had been used so industriously and so unselfishly gave way and the beautiful life ended. There were many hearts to feel

sad as the quiet form was carried to the grave, and it was not only the boys who had been her pupils, and the missionaries and Christian friends who had worked with her, but Hindus and Mohammedans who showed their respect and love by joining the funeral procession.

"A Lady of England, giving up her home and spending eighteen long years in work for the people of India ; a Lover of Everybody, reaching out a helping hand and speaking and writing helpful words to make other lives happier and holier. Was it not a beautiful life that ended on that December day?"

"PICTURESQUE VILLAGE HOMES."

For Lonely Gentlewomen of Narrow Means.

MRS. M. C. SMITH expounds in the *Westminster Review* a beautiful and admirable scheme which she has been carrying out. "There are," she observes, "thousands of women of gentle birth with small incomes, and endowed with no special training for any profession or business pursuit. With an annuity of perhaps £30 to £50 some of them live a lonely life in dreary lodgings or in boarding houses, others a still more uncomfortable one with more fortunate relatives."

TWO ANNE HATHAWAY COTTAGES.

The writer hit upon the idea that these women might be much more happily housed in country cottages, in some "cozy, sunny, picturesque places." "With this object in view, about eighteen months ago I started my first cottage. It took my fancy because it was detached and picturesque, with roses, honeysuckle and jasmine clambering over the rustic porch and round its doors and windows, grass plots in front and a gay border of flowers. This tiny nest contains only two rooms, the sitting room being supplemented by a small scullery."

The sitting room, when finished, made "a charming little snuggerly, with its writing-table and other accessories, as comfortable and refined as any fastidious lady could wish." The bedroom is large and airy. The rent of the cottage is five shillings weekly. "Two ladies living together in such a house could easily manage on £60 or £70 between them, yet live in comfort, independence and refinement." This first cottage has been "inhabited, enjoyed, and very much admired."

The writer's second venture was more ambitious. It is very old, and thatched like the other ; it is built in the same Anne Hathaway style. It is much larger, and might be called a five-roomed cottage, with three-quarters of an acre of ground attached. The rent of this cottage is 7s. 6d. weekly.

THE CLUB.

The third venture is the Club,—still a picturesque village home, accommodating four or five ladies who pay from 3s. 6d. to 5s. a week. Among many other advantages there is a pretty little donkey carriage for the use of the tenants.

"There is no charity connected with this scheme.

“LA MARÉCHALE.”

No donations or subscriptions are required. I offer my pretty homes, supplied with every necessary for use and comfort, and all I ask is rent. The domestic management is left entirely in the hands of the tenants themselves."

A NOTED NEWSPAPER CORRESPONDENT.

A BRIGHT sketch of Mrs. Emily Crawford occupies the place of honor in the *Young Woman*. The writer remarks upon her unique eminence in her profession, and her astounding powers of getting work done

"In addition to being the regular daily correspondent of the *Daily News* and *Pall Mall Gazette*, she has long been one of Mr. Labouchere's most valued regular contributors to *Truth*, and twice a week her brilliant epigrammatic letters enable the readers of the *New York Tribune* to know as much of the notabilities of to-day as if they were living in the gay city itself."

Born in Dublin fifty-two years ago, of an Irish country family, she removed with her mother and sisters, on the death of her father, to Paris.

INTRODUCTION TO JOURNALISM.

"My first introduction to journalism," said Mrs. Crawford to her interviewer, "was very simple. Owing to the fact that my mother had some very good connections, we were, soon after our arrival in France, invited to the Tuileries. Naturally I, as a young girl, was very much impressed and amused, and, may I add, shocked by much that went on in the Imperial circle, the more so that I noticed how garbled were the accounts in the English papers of that day both of the political and social life in Paris. A letter of mine, written to a private friend, was shown by her to a London editor. He was amused by my fresh style, and wrote to ask for an occasional article."

In her twenty-third year Miss Johnstone married Mr. George Crawford, a member of the English Bar, and a distinguished newspaper correspondent. "Then began what is rarely seen in this world—a perfect intellectual and moral union. Late and early husband and wife worked together." His sudden death, after many years of signal happiness, brought out yet more strikingly her indomitable will and prompt resource. She said: "When he died, I felt as if the world had come to an end; but I sat up by his dead body the whole night, writing an account of his career, in order to send it off at once to the paper he had served so faithfully. For the sake of my children I determined to try and obtain a continuance of the work, and after a short delay I was offered the reversion of his post."

MRS. CRAWFORD'S MOTTO.

She has chosen as her journalistic motto, "Observe, reflect, be genuine." She confesses that she "cannot dictate a line." She now regularly uses a type-writer. The writer reports this motherly trait: "The correspondent of the *Daily News* is, I believe, the only lady foreigner to whom was ever offered the *legion*

d'honneur. But, greatly to her friends' disappointment, she refused to accept it, begging that it might be given to her son.

"No woman ought to think of writing for a livelihood," we once heard the great lady journalist exclaim, "unless in addition to special aptitude she possesses dauntless courage, exceptional health and powers of physical endurance, and a considerable amount of reserve force."

"LA MARÉCHALE."

MISS FRANCES E. WILLARD tells the readers of the *Review of the Churches* the wonderful story of Mrs. Catherine Booth's eldest daughter. She recalls how Miss Booth "commenced public work when only fourteen years of age, driven to it by an irresistible urging of divine love after she had received a remarkable baptism of the Spirit." Asked what led her to choose France as her sphere of work, she replied that "as a child at school studying its history she learned to pity France from the bottom of her heart, and subsequently her father designated her for this mission." "She had always a special liking for the French language. 'I love France,' she said to me with sparkling eyes."

HER WORK IN PARIS.

"When La Maréchale opened the batteries of the Salvation Army on the Parisians, it seemed a forlorn hope. In her little hall at the bottom of an *impasse* in one of the rowdiest quarters of the city, the worst elements congregated, and it was amidst a bedlam of hostile voices, representing all the most aggressive forms of immorality and infidelity, that this frail woman fought nightly for God, and for six months she kept up this fatiguing struggle *every night* with the exception of a few Saturdays. No wonder she was wasted to a shadow. But it was not long before the "something" supernatural which inspired her was recognized, and the people began to call her 'Sainte Catherine.' Several years later how changed were the circumstances! La Maréchale was able to secure, in the fashionable "Salle de Conférences" of the Grands Boulevards, the attention of the *élite* of Paris. . . . In France and Switzerland last year the Army held nearly 300,000 meetings, dealt with nearly 5,000 souls at its penitent forms, while well nigh 800,000 copies of its salvation papers were sold."

THE RUDE MANNERS OF THE SWISS.

Miss Willard seems as unpleasantly impressed by the manners of the Swiss commonalty as by the "justice" of the Swiss authorities. "At another place a Russian princess was converted, and when we were in Switzerland we learned that this lady, while standing at the door at a meeting in Vevey selling Salvation literature, had her bonnet torn from her head, and was roughly kissed by a Swiss peasant, to which indignity she paid no attention whatever, but put on her bonnet and pursued her avocation. The lower class of Swiss people seem to be remark-

ably rude, crude, and almost cruel. In the orchard meeting to which I have referred, held by Commissioner Booth-Clibborn (the husband of La Maréchale), and attended by Lady Henry Somerset and myself, the conduct of the boorish young men present exceeded anything that we had ever witnessed.

"Her husband, Arthur Booth-Clibborn, . . . is for a man as handsome and every way attractive as she is for a woman. To say the truth, we never met a young pair more ideally fitted, or more righteously fond of one another. . . . Their present home in Paris is a small flat on a fifth story."

THE WOMEN OF HUNGARY.

H EFT 5 of *Unser Zeit* gives a short study of the Hungarian woman by Adolf Kohut. Some brilliant women, he says, have figured in the history of Hungary, especially such heroines as Maria Szechy, immortalized in a drama by Ludwig von Doczi; Cecilia Rozgonyi, who rescued the army and the King of Hungary at Galambocz, and too many others to do more than refer to here. It is of these women that the poets of the Magyar people sing, and these heroines live in the hearts of the people as the most perfect examples of beauty, virtue and bravery.

TENDER AND TRUE.

With regard to the Magyar woman who speaks the language of Petöfi and Jókai, and whose ancestors have really lived in Transleithania from time immemorial, the type is to be found in the country districts. Here we meet her with her coral lips and large speaking eyes, looking so obstinate and smiling so alluringly. The peculiar look in the eyes of the Magyar woman, her vivacity, her quick step, as well as her inclination for comfort, lead one to conclude that she has Turkish blood in her veins. She has a good heart, a kind disposition, is tender and true, with a passionate love or a passionate hatred for her husband; she is a good mother and trustworthy friend. True, she does not always know how to bridle her lively temperament, and she will sometimes be guilty of a breach of strict etiquette.

It is a mistake to assume that the Hungarian women are all brunettes, though dark brown is the prevailing color. An old national song says that they are neither fair nor brown; and Alexander Petöfi sings: "Beautiful are the blondes, beautiful are the brunettes, all Magyar women are beautiful when they are beautiful; and when goodness is added to beauty!"

SOMEWHAT VAIN.

A weakness is the Hungarian woman's great preference for elegant toilettes, for gold and silver, diamonds and pearls. She is vain, though she knows her beauty does not need any artifices of the toilet, but her coquetry is harmless and unconscious. She will not have any one else but her husband in love with her. The national dress adds to the natural charms of "the fair and the dark angels."

The women of Budapest, like the women of all large towns, like a perfect luxury of dress. They

will not only conquer in the drawing-room, but surprise the men and women in the streets. Their narrow shoes give them an unsteady step, and a certain tremolo robs them of their natural elasticity and holds them up to scorn. Jókai has held up to ridicule these fine ladies, and has endeavored to influence public opinion against such follies in dress. He has also had much to say against the coffee house life of certain ladies, who take their families out to restaurants for all their meals, and thus absent themselves from their husbands and their homes. "The hearth is not degrading; it may be a throne from which a woman may rule the world."

CZARDAS, OR NATIONAL DANCE.

The Oriental fire of the Magyar woman is most visible in the national dance, which neither the peasants nor the aristocracy can resist. The gypsies generally are very beautiful while they are young. They are well-proportioned, have thick hair, dark flashing eyes, pearl-white teeth, and coral lips. The expression of their features shows a mixture of wild shyness and melancholy dreaming. The grace of their deportment is inimitable.

The German women in Hungary have very different attractions: they are gentler, quieter, more intelligent and artistic. The Servians, the Croats, the Roumanians and the other nationalities dwelling in Hungary are all noticed casually. The Servian holds fast to old manners and customs, and loves the song and the dance. She has dark hair, while the other women have mostly light hair. The Roumanian is a very beautiful woman. She has black eyes with long eyelashes and thick eyebrows, and her black hair gives her face an ideal expression.

HILDEGARD WERNER.

The Lady of the "Litteris et Artibus" Medal.

A LTHOUGH it is now a couple of months since Miss Werner received so signal an honor from King Oscar of Sweden as the "Litteris et Artibus" medal, she is still the subject of eulogistic articles and biographical notices in Scandinavian magazines. *Svensk Musiktidning* is last in the field, but makes up for its tardiness by having the most correct and interesting biography of all, as well as the latest portrait of the eminent musician. So much, however, has already been written of Miss Werner in English papers, musical and otherwise, that extracts from this last biography would be superfluous. It may be mentioned, however, that Miss Werner is a prolific contributor of musical notes and personal reminiscences to the best of our musical magazines; and though perhaps best known as a pianist and violinist of very great power, she is also a composer of some note. Her latest composition, a very joyous and effective piece of music, entitled "The Festive March," is dedicated to Mr. W. E. Adams, the genial editor of the *Newcastle Weekly Chronicle*, to which paper Miss Werner is a frequent and valued contributor. Having been settled in England some twenty years, this

talented lady has become a good deal Anglicized in thought and manner, though still retaining her intense love of "little Sweden."

WAGNER AND GRIEG.

WAGNER has a warm and indefatigable champion in Mr. William Ashton-Ellis, Secretary of the London Wagner Society. The splendid translation of "Opera and Drama"—Wagner's *magnum opus*—is scarcely out of hand before Mr. Ellis is confronted with the duty of dealing with the grave charges brought against Wagner by Grieg, and, it may be added, by the late Ferdinand Praeger.

GRIEG'S CRITICISM OF WAGNER.

In January, Edvard Grieg published in the *Century* a critical study of Schumann, and in it took occasion to make some disparaging observations on Wagner, to which Mr. Ellis thus replies in the *Meister* of February:

"It is a sad thing that Edvard Grieg has done; it can do no good to the cause of Schumann's music, no harm to Wagner's name; and the only reputation it can possibly affect will be the writer's own. One might almost believe that in Grieg's eyes the world has just woken from a sleep of fourteen years, for he merely condescends to re-hashing *on dits*, and calling them 'open secrets;' but we know no words of courtesy wherewith to characterize the direct accusation of forgery brought by Grieg against Wagner, without the production of one tittle of evidence.

"If Grieg had been better acquainted with Wagner's style, he would have found words in the article which Wagner would never have dreamt of using, and he would have known that not only had Wagner published his views about Schumann in the essay 'On Conducting,' but in the very next number of the paper he had something to say concerning Schumann above his own signature.

"If there be any Schumann haters," Mr. Ellis concludes, "we have no wish to be classed among them, and therefore bid good-by to Grieg with his own remark: 'Schumann stands where he stood, impregnable, as does Wagner;' to which we add: Where now stands Grieg?"

Meanwhile Mr. Ellis has received assurances from the best authority that the article in the *Bayreuther Blätter* which Greig attributes to Wagner, was written by Joseph Rubinstein, and was neither dictated nor inspired by Wagner.

FERDINAND PRAEGER.

A much graver scandal is that of Praeger and Wagner's letters, which Mr. Ellis is exposing in the *Musical Standard*. "Wagner as I Knew Him" appeared just two years ago, and was recommended by the majority of critics as an "interesting book," and with only a few exceptions was its authority questioned. The book would probably soon have been forgotten again, but for the fact that a "German translation by the author" appeared at Bayreuth in the summer of 1892 during the Festival, and the physical congregation in one town of those naturally

hostile to all slanderers of Wagner's name rendered easy a comparison of notes.

In the meantime, Mr. Ellis had published "1849: a Vindication," and had exposed the gross errors, and worse than errors, in Praeger's account of Wagner's revolutionary period; but he little dreamt that Praeger himself was preparing the completest refutation of his own statements by his so-called translation from the English of his book. Hardly a page of the German does not contradict the author's own statements in English, and the most cursory examination showed that the passages from Wagner's prose had been translated first into Praeger's English and then into Praeger's German!

An important point left to what one may call a moral certainty was the alterations in Wagner's letters to Praeger. It was clear they were not textually reproduced in the German—that they had, in fact been meddled with—and the question remained, "Did they all even exist?" Mr. Houston S. Chamberlain, an English resident in Vienna, has just published, with the full assent of the owner, the originals of twenty of the letters printed in Praeger's book and one other. They have appeared in the *Bayreuther Blätter*, and in later numbers of the *Musical Standard*. Mr. Ellis will discuss them, and show how not one single sentence of the letters in "Wagner as I Knew Him" is given in the writer's own words, while those very letters which have been singled out by the English and German press as special targets for scorn are nowhere to be found.

A Sketch of Edvard Grieg.

William Mason makes in the March *Century* a conscientious and artistic study of the famous Norwegian musician, Edvard Grieg. Like so many musicians, Grieg was precocious to an almost absurd degree, beginning his studies at six and composing his first piece at nine years of age. Mr. Mason considers the revolt that Grieg made against classicism a healthy instinct, and discusses the master's adaptation of the eccentric, often weird Norse melodies, some of which seem to be fairly without rhythm.

A VISIT TO THE COMPOSER'S HOME.

"On the afternoon," concludes Mr. Mason, "of July 1, 1890, having received an invitation from Grieg, I made him a short visit at Villa Trolldhagen, his summer home, situated on the borders of the Nordstrand, a drive of about an hour and a half from Bergen. His house is of hard wood throughout, very substantial, and at the same time cozy and comfortable. The front door opens from the sitting or music room directly upon the lawn without any intermediate hall way. The grounds are beautiful, and in many places are thick with forest trees and shrubs, while here and there a clearing brings to view the waters of the fjord. The wild flowers, with their bright, rich colors, were especially attractive. Mrs. Grieg, a very charming woman of bright and cheerful disposition, entertains in a genial way. She is an excellent musician and singer, and has accompanied her husband on most of his concert tours. Her earn-

est and heartfelt singing, enhanced and supplemented by her husband's exquisite accompaniments on the pianoforte, has an effect of spontaneity as though improvised, and the result is in every way a genuine musical delight. Grieg himself is genial, cultured, and unaffected. He has a keen intelligence, and a cheerful disposition, which he retains notwithstanding the necessity of constant care of his health occasioned by a serious pulmonary affection contracted by studying at Leipsic. He is short in stature, and has a large and imposing head. His expression is serious, earnest and artless, and he is by nature repugnant to anything like posing. He leads a very retired life, rarely going out, and then only on extraordinary occasions. He is patriotic and public spirited, takes a constant interest in whatever affects the welfare of his country, and he has felt much concerned about the political changes now going on in Norway. His intense nationality, as well as his marked individuality, find constant expression in his music, the originality and style of which are unmistakable."

SOME COMPOSERS.

THE musicians are having a royal time of it in the magazines. We have this month illustrated interviews with Mr. Edward Lloyd and Signor Tosti, while "How Composers Work" is the subject of an interesting article by Mr. F. A. Jones in the *Strand Magazine* of February. The *fac-simile* reproductions of the MSS. of the composers were in most instances rewritten to be produced in the magazine, and are therefore specimens of their compositions when ready for publication rather than the first jottings of a composer, which are, as a rule, intelligible only to himself.

Sir Joseph Barnby finds that ideas come most readily in the railway carriage or during a drive, and he prefers the morning as the time for composition.

Mr. J. F. Barnett says that when an idea does not come to him spontaneously, he tries for something, generally at the piano. If he succeeds he dots it down, but does not feel satisfied till he tries it again the following day. He prefers the evening for composition and the morning for working out his ideas and for orchestration.

Sometimes Jacques Blumenthal composes at the piano, at other times away from it. He reads poetry, and when any poem strikes his fancy, he copies it out, and the verses wait till their time comes to be set to music. Some have to wait for years, some are composed almost at once; it all depends on the mood in which he happens to be.

Mr. F. H. Cowen does his work by fits and starts—that is, for some months continuously, almost night and day, especially when he is engaged upon a large work. The next month or two he will lie quite fallow. Mr. Alfred R. Gaul, when composing, first thinks of the necessary construction for best bringing out the meaning of the words, then of the melody and harmony.

Prof. C. H. Lloyd reads over the words he is to set

to music several times, till they suggest appropriate music, and then jots down his ideas on paper.

Each composer has also been drawn on such ever-green questions as the following: Which do you consider your best composition? Do you believe in writing to order? Can the art of composition be acquired if there is no aptitude? Are the English a musical nation?

Peter Cornelius, the Poet-Composer.

In Heft 7 of *Voms Fels zum Meer* Adolf Stern has an interesting study of Peter Cornelius, the poet-composer.

Cornelius is well known as a lyric poet and a composer. Born at Mainz in 1824 of a family of artists, he was first intended for the stage, and was only able to leave it for a musical career on the death of his father in 1843. Then he went to Berlin to teach and to study, and to lead a very trying existence, till Wagner and his art principles woke up the world, and among those who rushed to Weimar to hear "Lohengrin" and learn more about the music-drama was Cornelius. Liszt at once interested himself in the young musician, and the result was that Cornelius was settled in Weimar by the end of 1853. At the end of 1858 his opera, "The Barber of Bagdad," was performed under Liszt's direction, but it met with such systematic opposition that the composer was compelled to quit Weimar. After many ups and downs he reappears, and his other well-known opera, "The Cid," is produced with great success. He died at the comparatively early age of fifty.

Smetana, the Famous Czech Composer.

Works of Smetana have been so prominently brought before the German public of late that it is not surprising to find studies of the famous Czech composer in the magazines. *Nord und Süd* for February gives a sketch by Friedrich Hlavac, and the *New Quarterly Musical Review* has another by Mr. R. H. Legge, and both are highly interesting.

Before Smetana's day Bohemian music was non-existent, at least for all practical purposes; and however brilliant the future of Bohemian music may be, there can be no question as to the debt which it owes to Smetana for its past and to some extent for its immediate future.

He made his appearance as a pianist at the age of six. Later, Schumann's advice to study Bach again and again was acted upon, and Smetana's first appointment of note was that of concert-meister to the Emperor Ferdinand.

In 1848 he married the pianist Katharin Kolar, and, with her help, founded a pianoforte school in Prague. In the same year he made the acquaintance of Liszt, with whom he afterward became very intimate, and who exercised no little influence upon many of his subsequent compositions.

His opera, "Die Brandenberger in Böhmen," produced in 1866, was a success owing to the use made in it of national folk-music. "Libuse" was produced at the opening of the National Theatre in

Prague in 1881. In 1882 alas ! there was a marked decadence of power in the composer's work, and by 1884 the mental disease from which he died was too obvious to be ignored and the last few weeks of his life were spent in an asylum.

Some ten years before his death Smetana had lost his sense of hearing ; nevertheless in this pitiable condition he wrote a number of orchestral works and several operas. His own account of the growth of the disease is melancholy reading. He seems to have been followed everywhere by the most insufferably commonplace melodies, and immediately before the total deafness he constantly heard a sound as of harp-playing, and he declared that he could produce real musical notes by gently tapping the lobes of his ears.

At Prague a Smetana-cycle was given in September last ; but outside his own country he has been much neglected. He was only "discovered" at Vienna in 1892 and very few of his works have yet reached London. "The Sold Bride" seems to have aroused the greatest interest among the operas, but the symphonic poems, "Mein Vaterland," are charming pieces of programme music.

Palestrina, the Italian Composer.

February 2 being the 300th anniversary of the death of Palestrina, the magazines do honor to the memory of the great Italian composer by reviewing the position which he occupies in the history of church music. Chief among the notices is that by Mr. J. S. Shedlock in the *New Quarterly Musical Review* (London) of February. He acknowledges the service rendered by the Bach Society in affording some opportunity of hearing Palestrina, but regards the conditions under which that music is presented as inadequate and misleading. Palestrina consecrated his art to the service of religion. Another sketch appears in Heft 8 of *Ueber Land und Meer*.

NATURE IN EARLY AMERICAN LITERATURE.

TO the pages of the *Sewanee Review* Mr. Selden L. Whitcomb, of Columbia College, contributes a study of "Nature in Early American Literature." The period which the writer examines (1607 to 1814) is not usually considered very important in our literature, but some interesting material is here brought to notice.

In the early pages of his article, Mr. Whitcomb traces in general terms, but with some illustrative examples, the progress our early observers of nature made from a merely business point of view toward an emotional and poetic interpretation. There was also a growing investigation of the more secret phenomena, and an increasing appreciation of the "finer shadings in nature's harmony." The humming bird and the whippoorwill entered American literature at a very early date, but it took some time to discover that no nightingale sings in our hedge rows. The two individual observers of the eighteenth century to which the article gives most space are :

JOHN BARTRAM AND ST JOHN DE CREVECEUR.

The former, "from the importance of his historical position, and no less from the inherent interest of his career, deserves to be considered a classical figure among our early naturalists." The story of his conversion to botany is thus told in his own [?] words : "One day I was very busy in holding my plow (for thou seest that I am but a plowman), and being weary I ran under the shade of a tree to repose myself. I cast my eyes on a daisy ; I plucked it mechanically, and viewed it with more curiosity than country farmers are wont to do, and observed therein very many distinct parts, some perpendicular and some horizontal. 'What a shame,' said my mind, or something that inspired my mind, 'that thee shouldst have employed so many years in tilling the earth and destroying so many flowers and plants, without being acquainted with their structures and their uses !' I returned to my team, but this new desire did not quit my mind." Crevecoeur, the author of the once well-known "Letters of an American Farmer," published just before the Revolutionary war, united an independent observation of nature with a graceful style in recording its results. The birds in which he is interested are those that nest, scold, preen their feathers and teach their young to fly about his own domicile. A score of writers had already pictured the marvellous tints of the humming bird, but Crevecoeur does not rest content with what were already commonplaces. He has noticed that "this insect bird will tear and lacerate flowers into a hundred pieces ;" that two humming birds will fight as furiously as wild beasts until one falls a sacrifice to this strange ferocity.

Mr. Whitcomb discusses the policy which Dennie followed in his portfolio (founded in 1801) toward American literature and toward the artificial style of pastoral then in vogue, and contrasts the very different attitude toward nature of our first professional man of letters, Charles Brockden Brown, and the American ornithologist, Alexander Wilson. Many evidences of a better appreciation of the actual home phenomena of nature are found in the periodical literature from 1800 on, and in 1814

BRYANT'S YELLOW VIOLET BEGINS A NEW ERA.

This poem, Mr. Whitcomb thinks, is more truly due to the inspiration of actual contact with nature than *Thanatopsis*. He concludes the article with the generalizations : "From the beginning of colonization until the present day, there have been writers in America seeing with interest and with pleasure what nature has set before their eyes ; whose conscious life has been to a greater or less extent molded by her constant presence. . . . All that was genuine in our early poetry and prose, however humble and imperfect, had a share in the influences which made possible Bryant, Emerson, Thoreau, Whitman, and gave to each a loving, understanding audience. We need have no regrets for the loss of so much of our literature of nature as lacked sincerity. It is not dead. It is lying non-existent, for, as Thoreau said, 'in order to die, it is necessary first to have lived.'"

THE PERIODICALS REVIEWED.

THE FORUM.

THE articles by David A. Wells on the income tax, by Simon Sterne on railroad failures, and by Prof. W. G. Sumner on "The Absurd Effort to Make the World Over," have been noticed at length among the "Leading Articles of the Month."

DUTY OF EDUCATED MEN IN A DEMOCRACY.

Mr. E. L. Godkin grapples with the "scholar in politics" problem. He believes that while college graduates fail to bring away from the universities any great amount of knowledge, still the general effect of college training is to raise the standards of public duty. "This brings me to the question, What is really the attitude of educated men toward universal suffrage to-day? As a general rule I think they really mistrust or regret it, but accept it as the inevitable."

The shortcomings which Mr. Godkin charges up to our educated class are not such as people generally impute to "literary fellers." He says we are suffering from a dearth of criticism.

"It is a very rare thing for an educated man to say anything publicly about the questions of the day. He is absorbed in science, or art, or literature, in the practice of his profession, or in the conduct of his business; and if he has any interest at all in public affairs, it is a languid one. He is silent because he has not much care, or because he does not wish to embarrass the administration or 'hurt the party,' or because he does not feel that anything he could say would make much difference. So that on the whole it is very rarely that the instructed opinion of the country is ever heard on any subject."

So Mr. Godkin concludes that it is the duty of educated men to "talk" more than they now do, and to talk to some purpose.

THE GOTHENBURG SYSTEM AND OUR LIQUOR TRAFFIC.

Dr. E. R. L. Gould answers several objections that have been urged against the adoption of the Gothenburg system in the United States and shows that the introduction of the system would not stop the progress of prohibition, State or local, since local option features are a part of the scheme, and the people may choose every three years whether or not the sale of all kinds of liquors shall be suppressed.

STABILITY OF THE GREAT RELIGIOUS SECTS.

H. K. Carroll, special agent of the U. S. Census for church statistics, presents interesting deductions from the data that he has collected relating to the comparative strength and vigor of the various denominations. "A hundred years ago the prominent denominations were Baptist, Catholic, Congregational, Friends, Episcopal, Lutheran, Methodist, Presbyterian and Reformed. These bodies still constitute the chief part of the Christian forces, with some changes in their relative positions. The Catholic group is numerically in the forefront, the Methodist is second, the Baptist third, the Presbyterian fourth, the Lutheran fifth, the Episcopal sixth and the Congregational, which has no branches, seventh. Phenomenal cases of growth are those of the Catholic, Methodist, Baptist and Lutheran groups, the first and last chiefly by immigration. The increase of the Presby-

terian, Episcopal and Congregational denominations has been large, but more gradual."

RELIGIOUS ANALYSIS OF A NEW ENGLAND TOWN.

The chief interest to the general reader in the Rev. Wm. B. Hale's brief study of the religious and social history of the town of Middleboro, Mass., lies in the fact that in many respects the town is a typical one, and the conditions investigated by Mr. Hale are duplicated all over New England.

"At present there are in the town :

Congregationalists	700	Unitarians	100
Roman Catholics	600	Perfectionists	30
Baptists	450	Adventists	20
Methodists	300		
Episcopalians	100	Total	2,300

and 4,500 persons who have no affiliations of any sort with any religious body. There were last Sunday in the fifteen churches of the town less than twelve hundred people; that is, for every three persons who went to church there were seventeen who did not go. Most of the religious societies are in debt; every church is of wood, and several of the organizations have neither a church nor a hope of ever having one."

THE NORTH AMERICAN REVIEW.

SIR G. S. CLARKE'S article on a "Naval Union with Great Britain" is summarized in the preceding department.

THE HOUSE OF REPRESENTATIVES AND THE HOUSE OF COMMONS.

Secretary Herbert comes to the defense of the committee system as maintained in the lower House of the American Congress.

"It is not intended in this article to assert that the committee system is perfect, but only to maintain that under our form of government the House of Representatives must necessarily have committees of its own members to prepare legislation, and that the system at present existing is not subject to the grave objections urged against it. It is true that members may trust committees too implicitly, but the same objection would seem to lie against a system of parliamentary government where the ministry must be followed implicitly in every important measure, the penalty of a defeat of the government in every such case being the immediate loss of every seat and another appeal to elections. . . .

"One undeniable advantage of our committee system is that it brings members of opposing parties and different sections into close personal relations with each other. The extent of population and territory, the variety of climate and products, with the geographical distribution of our industries, result in a constant clash of interests. It certainly is desirable that those who are to reconcile these interests should be able to attribute to each other, where they exist, the virtues of patriotism and integrity, and every experienced member knows that mutual respect and confidence are a common, and warm friendship between men of opposing parties and from different sections a not uncommon, result of joint service on committees."

NEW ASPECT OF THE WOMAN QUESTION.

Sarah Grand, author of "The Heavenly Twins," discourses on the twentieth-century woman.

"It would be as rational for us now to declare that men generally are Bawling Brothers or to adopt the hasty conclusion which makes all men out to be fiends on the one hand and all women fools on the other. We have our Shrieking Sisterhood, as the counterpart of the Bawling Brotherhood. The latter consists of two sorts of men. First of all is he who is satisfied with the cow-kind of woman as being most convenient; it is the threat of any strike among his domestic cattle for more consideration that irritates him into loud and angry protests. The other sort of Bawling Brother is he who is under the influence of the scum of our sex, who knows nothing better than women of that class in and out of society, preys upon them or ruins himself for them, takes his whole tone from them, and judges us all by them. Both the cow-woman and the scum-woman are well within range of the comprehension of the Bawling Brotherhood, but the new woman is a little above him, and he never even thought of looking up to where she has been sitting apart in silent contemplation all these years, thinking and thinking, until at last she solved the problem and proclaimed for herself what was wrong with Home-is-the-Woman's-Sphere, and prescribed the remedy."

THE OUTLOOK FOR WAR IN EUROPE.

Archibald Forbes is confident that at least two years are likely to elapse without bloodshed, but when the conflict finally comes, it will be a struggle to the death. "The *vae victis* will be overwhelming, for the nations which shall be vanquished must reckon on suffering dismemberment. The map of Europe will be transformed out of recognition. If the Triple Alliance conquers, there will be no longer a French nation, and Russia will be reft of all territory west of the Dnieper, and of the Baltic Provinces as well. In the contrary result, Italy will be the washpot of France, and over Germany will Russia cast her shoe."

NATURAL MONOPOLIES AND THE WORKINGMAN.

Prof. Richard T. Ely emphasizes, as a practical programme of social reform, his well-known policy of government ownership of non-competitive business.

"To the anti-socialist it may be said that what is advocated is not socialism, but something far from it. A policy which leaves to private enterprise agriculture, manufactures, and commerce is something quite different from a policy which leaves no field for private industry. To the socialist it can be said: Let us try this reform first. You want this, and so do we. Here is a point of union. To the wage-earner it can be said: The change proposed is not one which holds out extravagant hope, but it does give a prospect of gradual and steady improvement and is a preparation for other steps forward. Will you put aside bitterness and contention and unite in measures which tend gradually to bring about the socialization of natural monopolies? Maintain friendly relations, so far as in you lies, with all men. Cultivate peace, patience and long-suffering. Make haste slowly and secure each step forward. Attend to your individual duties while working for social measures. Put aside envy and jealousy and be willing to learn even from your enemies. While allowing nothing to turn you aside from your purposes, follow these purposes 'with malice toward none and charity for all.'"

PRISONS IN THE OLD WORLD AND IN THE NEW.

Major Griffiths, Her Majesty's Inspector of Prisons, takes a gloomy view of American penal institutions.

"That a great country which once led the van of prison reform should to-day lag so far behind is more its misfortune than its fault. Grave social and economic difficulties have no doubt hampered the question of penal treatment in America. It has been complicated by the constant influx of comparatively poor immigrants, the admixture of so many alien races with the native born, the presence of the negro element which has supplied a large percentage of the worst crimes. The rapid growth of territory again, the pressure upon young communities to establish more useful institutions, the continual strife of political parties, and the continual change of office-holders have largely affected the question. It has been for the most part grappled with in only the oldest States, and not always comprehensively in them."

THE ARENA.

ELSEWHERE will be found reviews of Henry Ware Allen's article on the annexation of Mexico and of the series of papers on union for public good.

MANUAL TRAINING.

In contrasting new with old methods in education, Arnold H. Heinemann argues that "a judicious practice of manual training increases the energy and vivacity of the mental powers of the pupils, and enables them, in a much shorter time, to assimilate more new ideas and to be able to reproduce them better than they can do when they have to devote all their time and strength to intellectual pursuits. In this way manual training proves to be the true and only natural method—the method which nature herself employed in the evolution of the human race."

NATIONALIZATION OF RAILROADS.

Rabbi Solomon Schindler again advocates the purchase of railroads by the government. "Let the people once decide to nationalize railroads, and they will soon learn how to do it."

THE NEW BIBLE.

Rev. Frank Buffington Vrooman aims to point out the relation which modern Biblical science sustains to the spread of "world religion." "The situation is in a way analogous to that of a congregation whose village has become a city. Its necessities have demanded a house of worship larger and better than the one in which the fathers worshiped. Many a sacred memory and tradition must be destroyed. The high-backed pews which have been in the family for generations, the preacher's perch, the choir 'loft,' the dull, square, beautiful, dear old place must go and something new must arise upon its site."

JESUS OR CÆSAR.

Mr. Flower, the editor of the magazine, bemoans the spirit of the time, which he thinks is far more in accord with Cæsarism than with the gospel of Christ. He advocates a vigorous educational work "not only for the higher development of the unfortunate, but also for awakening the conscience and calling out all that is noble and divine in our nature, for kindling a love of justice which should become an overmastering passion, for teaching the individual to be true to his best self, and for impressing on the minds of all that no one lives unto himself."

THE FORTNIGHTLY REVIEW.

SCIENCE, politics, economics, literature, and travel are all well represented in the current number of the *Fortnightly Review*.

HOW MR. PLUNKETT WOULD SAVE IRELAND.

The series of articles on Ireland by two writers both signing themselves X., leads Mr. Horace Plunkett to criticise their pessimism and nationalism, and at the same time to suggest his own remedy. His point is that a complete change in the industrial habits of the people is the first requisite. We must begin with the people where they are on the land. And the new social force on which he would rely for the needed transformation is "agricultural co-operation." He gives an interesting account of his success in developing a co-operative society of dairying industry. This industry had previously dwindled since Continental dairymen had learned co-operative methods. An enlarged peasant proprietary would promote the movement, and agricultural organization would give better security to the State for money lent. Industrialism, not nationalism, is his motto.

HINTS FOR THE COMING ENGLISH BUDGET.

The "Poor Man's Budget" suggested by the Radical memorial to the Chancellor of the Exchequer is sympathetically expounded by Mr. W. M. J. Williams. He illustrates his proposals by the following estimated results:

EXTRA REVENUE.		NEW EXPENDITURE.	
1. From graduated probate.....	£5,000,000	£2,500,000	Deficit.
2. From graduated income tax ..	5,000,000	2,500,000	Navy, extra.
3. From graduated succession duty.	4,000,000		
4. From local probate moiety ...	2,250,000	4,000,000	} Remission of breakfast duties.
Total	£16,250,000	£9,000,000	
Balance for further relief of taxation.....	£7,250,000		

CARBON THE SOURCE OF SOLAR LIGHT.

Sir Robert Ball unearthed a theory advanced by Dr. G. J. Stoney in 1866, as to the composition of the photosphere or luminous clouds enveloping the sun. It is not from the hottest part of the sun, where all elements are in gaseous form, that we gain the most light, but from this outer sphere or shell of cloud, in which the elements must be not gaseous, but liquid or solid. Of the elements which could be either liquid or solid at such a temperature, the writer arrives at one which satisfies all the conditions—carbon. So "Dr. Stoney has concluded that the same element, which is the great source of artificial light in almost all forms on this earth, is also the source of solar light. Our conception of the important functions of carbon in the universe is thus greatly extended."

CRISPI AS DESPOT.

"An Observer" indulges in very strong language about *l'uomo fatale*, as the Italians call Signor Crispi. The result of his appointment has been "the abolition of all liberties and safeguards of the body politic, and the substitution of secret, irresponsible, and absolutely despotic tribunals and secret agencies worked by the will of one man. . . . Italy is at the present time as completely ruled by an unscrupulous despotism, and by sheer use of

the sabre and musket, as is Poland at this hour, or as Austrian Venetia was earlier in the century."

"FROM CAPE TOWN TO CAIRO."

"I have found out one thing, and that is, if you have an idea, and it is a good idea, and if you will only stick to it, it will come out all right," so Mr. Lucy reports Mr. Cecil Rhodes, and adds: "The good idea to which he intends to stick is to open and maintain communication under the British flag across the African continent between Cape Town and Cairo. . . . He does not believe England will ever withdraw from Egypt, and, seeing in his mind's eye the British flag permanently flying at Cairo, he desires to make a highway of communication with the older British outpost at the Cape."

THE CONTEMPORARY REVIEW.

THE contents of the March number are of a kind thoroughly characteristic of the *Contemporary*: sociology and theology, in varied phases preponderating, but politics, literature and science not overlooked. Several of the articles will leave a lasting mark on the reader's memory. We have noticed elsewhere a French official's "Village Life in France," and Lieut.-Colonel Elsdale's striking predictions on "Scientific Problems of the Future," as well as Mrs. Henry Fawcett's defense of New Zealand women.

SHAKESPEARE FROM A NEW POINT OF VIEW.

Phil Robinson essays to prove the Shakespearian authorship of "Titus Andronicus" by showing its continuity in points of natural history with other works. "As a matter of fact, Shakespeare has never yet been seriously approached on the side of his natural history. His references to Nature in some departments have been catalogued, but there has never been any intention hitherto to establish the individuality or identity of the man Shakespeare from his natural history, nor to study it as a whole with relation to the writer. It may be a matter for surprise that it should have been left for me, an unaccredited student of the Bard, and at the end of this century, to look at Shakespeare from a new point of view. But the fact remains."

TOLSTOI ON RELIGION AND MORALITY.

The Russian Count gives his answer to an Ethical Society who asked him to distinguish or relate religion and morality. Correspondent to his three stages of human evolution—savage, social, Christian—he classifies religions as those which aim at the gratification of the individual himself, of the society in which he stands, of the Superior Will which produced him. Without a religious foundation there can be no true, unsimulated morality, as without a root there can be no true plant. And so . . . I say religion is the conception by man of his relation to the infinite universe, and to its source. And morality is the ever-present guide of life proceeding only from this relation."

THE SECRET OF MORMON SUCCESS.

Rev. H. R. Haweis completes his glowing sketch of Mormon history. He thus enumerates the vital elements of their faith and progress: "Now take their faith in a living and constantly self-revealing God, in a prophetic ministry, in a sacred book, in an atoning love, in a communion of saints, in spiritual manifestations, and add thereto a stern respect for the moral law (as defined on the lines of the Old rather than the New Testament), ad-

mirable thrift and organized industry, obedience to authority, immense energy spent upon the unexhausted and apparently inexhaustible resources of a new world, and last but not least, a succession of men endowed with singular courage, genius and devotion, like Joseph Smith, Brigham Young, Taylor, Woodruff, Cannon and Clawson, and enough has been advanced to explain the vitality of the Mormon faith and the prosperity of the Mormon people."

THE NINETEENTH CENTURY.

THE contents of the March number of the *Nineteenth Century* show a wide and fairly balanced variety, and supply in the main bright and lively reading.

THE SHAH'S NOTES ON ENGLAND.

Professor Vambéry gives an account of the Shah of Persia's Diary of his last European visit, chiefly as it bears on his last stay in England. He was profoundly impressed with the public receptions, and still more the private hospitality extended to him here. He was very observant, and noted down a great number of details. Of Lady Salisbury he remarks, "She is a lady of middle size, highly respectable, up in politics, exceedingly wise and clever."

"The Shah's diary is decidedly the most comprehensive guidebook to English aristocratic, social and industrial life." The professor suggests that "London ought to have special allurements for Asiatic princes. Palaces for Mohammedans and Hindus provided with mosques and temples, with basins and baths, ought to be at the disposal of royal visitors anxious to visit the British capital without infringement of their religious and customary life, and the lesson in European culture imparted to them at a distance would have a much greater effect if supported by studies made on the spot."

"A MOST IMMORAL AGITATION."

Sir Lepel Griffin exults in the prospect of the British Opium Commission knocking the bottom out of anti-opium allegations. Lord Kimberley only appointed it, he says, to escape pressure and to secure the collapse of the fanatics. Of the latter, Sir Lepel exclaims: "Poor, simple, honest hearts! They did not know that, judged by any truthful standard, the people of India were on a far higher level of morality than Englishmen; that they were industrious, sober, chaste and religious; that a drunken man was rare, unless he were an Englishman; and that a drunken woman was unknown."

Already the evidence has shown "the temperate habits of the Indian people, and that consequently opium is taken in moderation, not in excess; that its results are beneficial and not injurious; and that, in many unhealthy districts, it is a necessity rather than a luxury."

"The anti-opium agitation" he declares to be "one of the most immoral in modern history."

OTHER ARTICLES.

Mr. Edward Dicey interprets Mr. Chamberlain's plea for a united national party to mean that the Liberal Unionists should simply merge themselves in the Conservative Party, and he endeavors to smooth the way for all Liberal Unionists like himself. What serious difference is there between us? he asks. "I was never able to take our English party divisions very seriously."

A sketch of Notre Dame d'Amiens leads Mr. Walter Pater to observe that, as distinct from the later monastic artists, "those old, very secular builders aimed at, they achieved an immense cheerfulness in their great church."

THE NEW REVIEW.

THE *New Review*, true to its name, keeps familiarizing us with novelty. This month it presents us with the first act of a dream poem, "Hannele," by Gerhart Hauptmann, translated by William Archer. It also gives us three humorous sketches by Thackeray. These, with three others, he drew within an hour while at a friend's house, talking gayly all the while. Mr. Harry Quilter, in an *Apologia pro Arte Mea*, humorously brings together press criticisms on his work which are incongruous and contradictory, and wants to know what a man is to make of all these. "Nauticus" furnishes a study in "The Official Estimates of Rival Navies." He marvels at the fact "that among a people which aspires to lead the world in naval matters, ignorance of things naval is so general, that of critics who can be expected to intelligently analyze such a return there are not six in Parliament nor twelve, outside the navy, in the rest of the Empire." He contrasts the weeks spent in Parliament over parochial business with the few hours' discussion given to the Navy, on which England's future existence depends. Lords Halsbury and Ashbourne, the Earls of Iddesleigh and Donoughmore, contribute their views on "The House of Lords as a Constitutional Force." The late Francis Adams' daring disparagement of Tennyson is noticed elsewhere.

THE NATIONAL REVIEW.

THE March number of the *National Review* is mainly political. The Symposium on the Referendum is noticed elsewhere.

A French deputy, M. André Lebon, essays to set forth the true state of French feeling toward England. France increases her fleet not with any desire to dispute British maritime supremacy, but to cope with the Triple Alliance. He will not deny that the current opinion of France is unfavorable toward the British. He gives as reasons: Protectionists have identified England with the Free Trade policy they hate. The French have not received from Englishmen the sympathy or even the justice they had a right to expect on the question of Alsace and Lorraine. The English press habitually treats all foreigners, and especially the French, as inferiors. England has more national jealousy toward France than the English themselves know.

"A Family Man" unfolds his domestic budget and shows the cost of living of a working gentleman and his family with an income of £700. He discusses affirmatively the question: Is life worth living at the price? He reports that "it is regarded simply in the light of a crime for any one under £1,000 a year to have the audacity to have a family." By way of reducing expenses he advocates linking a whole street together into a sort of co-operative home. A poem by Alfred Austin finds the true ruler of mankind not in sword or senate, but in "the silent eremitic mind," "lord of all knowledge while itself unknown."

"A Conservative M.P." advances reasons for a coalition between his party and the Liberal Unionists. Whips and private secretaries take such a coalition for granted. He finds the real line of cleavage between parties in their attitude to the demands of labor. Lord Stanley of Alderley indulges in somewhat desultory gossip on the Welsh Land Commission, which he charges with undisguised one-sidedness. "Z." offers some side aspects of Disestablishment with a view to detaching from it certain Liberal Unionists, Liberal Churchmen and those politicians who only support it because believing it inevitable. Capt.

Maude reviews Capt. Mahan's epoch-making work on the "Influence of Sea Power."

THE CENTURY.

WE have reviewed in another department articles on "The Suppression of Bribery in England," by Prof. Jeremiah W. Jenks; "The Anti-Catholic Crusade," by Dr. Washington Gladden; "The Imagination," by James Russell Lowell; "The City Tramp," by Josiah Flynt, and "Edvard Grieg," by William Mason.

The above articles cover the important papers in the *Century*, but there are besides several very pleasant sketches—notably a beautifully illustrated sketch which Charles de Kay puts under the delicious title of "Drowsy Kent."

This number begins with a paper, "The Tuileries under the Second Empire," by Anna L. Bicknell, who is titularly described as "an inmate of the palace." The value of this small historical chapter lies in the inside view it gives us of the imperial family and their customs. Of the Tuileries she says: "It was anything but a convenient habitation, built as it was at different periods and with different aims. Several of the galleries had been cut up into apartments for the use of the numerous members of Louis Phillippe's family. These were separated by passages having no means of external light or ventilation, so that lamps burned day and night and the air was close and heavy. The different floors communicated in the interior by narrow, winding staircases, also lighted much of the time, so that the first impression to the visitor was strangely lugubrious and funereal. Two floors, also, had been made out of one, so that the ceilings were low, and the deep windows prevented the free transmission of light, especially darkening the room situated toward the north. The conveniences of modern life were very imperfect. During the greater part of the Emperor's reign there was not even water put in, and the daily supply of the inmates was brought up in pails to the various apartments. The sanitary arrangements and drainage were very bad; in the regions inhabited by the servants the air was absolutely pestilential."

HARPER'S.

IN another department we have quoted from Mr. Poultney Bigelow's paper on "The Russian and His Jew." In Mr. R. R. Bowker's necessarily very technical article on the manufacture of "A Steel Tool," he gives some carefully arranged statistics of wages and production in the iron and steel industry, which show, among other things, that the United States surpasses in quantity of product by about one-fourth her nearest competitor, which is England. As to the future, Mr. Bowker says: "That the United States will continue to increase the distance between herself and the most productive of her competitors is scarcely to be doubted. With such a large supply of the richest ores lying within easy reach of our principal iron centres, the primary condition is in our favor. The ingenious mechanical contrivances in our works, which are in some respects in advance of those used in England, enable the workman to accomplish much more—a consideration which probably has much to do with the ability of the manufacturer to pay higher wages. Sir Isaac Lowthian Bell, the foremost metallurgical authority of Great Britain, some years ago solemnly warned his countrymen that if they expected to compete in the world's market with the Greater Britain over the water, they must study and adapt the economics in hand labor

which American skill and energy had made so brilliantly practicable in iron and steel making."

In the Editor's Study, Mr. Charles Dudley Warner delivers himself as to the imminent question of the "Greater New York." He does not consider the problem of the inherent advantages of very large cities as at all solved, pointing to the "undigested mass of poverty, feebleness, and suffering of human 'slag' which London and Paris contain."

SCRIBNER'S.

THERE is opportunity for some very striking illustrations in the article on "The High Building and Its Art," by Barr Ferree in the *March Scribner's*. Mr. Ferree traces the introduction of the enormously tall office building from the very evident needs of our city space—colossal structures which, as he says, are miniature cities in themselves, many of them containing day populations exceeding that of a considerable town. He is more particularly interested in the architectural task involved in the designing of one of these giants, and it is not difficult for him to impress upon us the harrowing obstacles in building "a thing that is high and without breath." "Nothing like this," he says, "has ever happened before, and in an art which, like architecture, depends so largely upon what has been done previously, there need be little wonder that our architects have not always achieved satisfactory results."

Octave Thanet is a very charming contributor to the series of articles on "Men's Occupations" which *Scribner's* is publishing. She talks about "The Farmer in the North," and her description of him is brightened up by some inimitable touches. She does not satisfy herself with speaking of the disappointed and "legislative" Kansas farmer and of the "foot-sore and soul-sore toiler that Garland paints," but she also has more pleasant things to say of "the farmer as I know him in my own Iowa county, with his generous fields and trig fences, his comfortable, painted house, his barns bursting with plenty, his contented cattle and his shelter for his farm machines. This Western farmer has passed the pioneer stage. Yet I must confess that prosperous as he is, he moves into the village as soon as he accumulates a competency, and his brightest boys want to leave the farm. Nor do I wonder. It is a lonely life, and until we solve the problem of mitigating that loneliness our farmers will not turn to the farm except as they are flogged there by necessity."

Mr. Charles R. Dodge tells us, in his paper on "Subtropical Florida," how much is missed by the conventional tourist who rushes from the North to the great hotels and famous resorts of Ponce de Leon land and to them only. He draws a fascinating picture of the southern part of the peninsula which is not yet given over to tourist travel, with its pleasant bays and wild Everglade swamps and its tropical vegetation, its Indians and its deer. In another department of this number appears a review of Mr. Hubert's article, "The Cable Street Railway." Last month we noticed "The Sea Island Hurricanes" by Joel Chandler Harris.

THE *Review of the Churches* brings to a close with Mr. Riley's rejoinder the Round Table Conference on the School Board controversy. Archdeacon Farrar gives an interesting and most sympathetic account of Dr. Stephenson's Homes. Miss Willard's sketch of "La Maréchale" is noticed elsewhere. Dr. Lunn announces attractive arrangements for tours and tourists to the Reunion Conferences to be held at Grindelwald.

THE COSMOPOLITAN.

FROM the March *Cosmopolitan* we have selected W. D. Howells' "Letters of an Altrurian Traveller" and Dr. Lyman Abbott's story of the youth of Christ to review among the Leading Articles.

In the department of Mr. Walker's magazine that he calls "In the World of Art and Letters," Mr. I. Zangwill falls over the discussion of M. Richard Le Gallienne's "Religion of a Literary Man" into a fine rhapsody of irony. "My suggestion," says Mr. Zangwill, "is that the religion of the future shall consist of the most pessimistic propositions imaginable; its creed shall be godless and immoral, its thirty-nine articles shall exhaust the possibilities of unfaith and its burdens shall be *vanitas vanitatum*. Man shall be an automaton, and life a hereditary disease, and the world a hospital, and truth a dream, and beauty an optical illusion. These sad tidings of great sorrow shall be organized into a state church, with bishops and paraphernalia, and shall be sucked in by the infant at its mother's breast. Men shall be tutored in unrighteousness, and innocence shall be under ecclesiastical ban. Faith and Hope shall be the seven deadly virtues, and unalloyed despair of man and nature a dogma it were blasphemous to doubt. The good shall be persecuted and the theists tortured, and those that say there is balm in Gilead shall be thrust beyond the pale of decent society."

President Daniel C. Gilman, of Johns Hopkins University, has a word to say in the same department on a favorite reform of his—the teaching of handcraft, and especially of drawing as a part of the college course. He says:

"Most Bachelors of the Liberal Arts have never learned to draw the simplest objects, with any approach to accuracy, a cube, a cone, an orange, or a flower, nor have they even mastered the elements of mechanical draughting so that they can make with rule and compass a legible diagram or a working plan. As for sketching the lay of the land when they travel, catching the characteristics of a church, a cottage or a boat, or limning the form and features of fish, bird, beast or man, they are as infantile as they would be in managing a steam engine, or landing a tarpon, or translating the Nimrod epic from the original cuneiform."

M'CLURE'S MAGAZINE.

THERE is in the March *McClure's* a capitally illustrated personal article on "John Ruskin at Home" by H. M. Spielmann, editor of the *Magazine of Art*, who draws the following portrait of the poet:

"There he stands, erect though bent; for the chronic stoop, the result of a feeble spine in early manhood, hardly prevents him from holding himself upright, though it has reduced his height from that of a tall to that of a medium-sized man, and set his head well down between his shoulders. More often than not he wears a dark blue frock coat and trousers and double-breasted waistcoat of good homespun tweed, woven by his own St. George's Guild—a manufacture which has taken firm root in England among the village industries, but which has not exactly flooded the market, because the quality is (to the trade) so exasperatingly good that the linens and cloths will not wear out.

"Thus he is when he is the host: his ample iron-gray locks, long and silky, combed back, but falling rebelliously about his temples; and his beard, well-trimmed for a time after he began to grow it in 1881, but now long and patriarchal, dropping within his waistcoat, or, when he is in bed, picturesquely flowing down the dressing-gown in

a stately sweep. It was that beard, by the way, which he admits, with his charmingly confessed tenderness about his appearance, he thought made him look 'the least bit nice'; but which, he declared, made him 'come out like an ourang-outang' in his photographs. And nothing could be more vivacious than his conversation, partly through his enormous range of information and experience, partly through his command of language and expression, and partly, too, through his keen and rapid intelligence and striking originality of thought."

THE SOUTHERN MAGAZINE.

THE March number of the *Southern Magazine* comes out in a gay cover of pink and green. Mr. Edward Ingle calls his article on the great specialization in newspaper printing, editing and publishing, "A Paradox of Co-Operation," and he thinks that co-operation has gone much too far in journalism. As to its evils, he says:

"Newspaper reading, like beer drinking, is an acquired taste for the majority of Americans. Long and regular indulgence in it has not only brought the newspaper almost to the category of absolute necessities, but the rapidity and cheapness of its manufacture have made a continuance of the habit a question of quantity rather than quality."

There are several pleasant stories and descriptive articles, one of the former illustrated by the only artist who has yet seemed to have any success in picturing the Southern negro—E. W. Kemble. This magazine is offering a series of three prizes for the three best short stories submitted by writers who have never had contributions accepted by the half dozen more important magazines—an interesting innovation.

ATLANTIC MONTHLY.

PROFESSOR JEREMIAH W. JENKS' thorough character sketch of the Greek minister, Tricoupis, we have reviewed in another department of the magazine.

Writing under the alarming title "Is the Musical Idea Masculine?" Edith Brower ventures to explain why the world has never seen a great woman composer. Her arguments, which she explains at length, are principally that, in the first place, woman, while possessed of wit and wisdom and humanity and power, is not capable of vieing with the greatest men in expressing intense emotional scenes. "She stimulates us delightfully; she enchains, absorbs us: nor is her hold ephemeral; but she is incapable of that soul-carrying rush, that culminating crescendo of emotional force, which makes largely the overwhelming effect of Browning's poetry, of Macaulay's and Ruskin's prose, of Wagner's operas."

And, then, in the second place, woman is not in harmony with the abstract.

"The fact of this repulsion from the abstract felt by woman (evidences of which repulsion are met with in those most gifted in imagination and emotional force) makes it appear highly probable that, unless her nature be changed—which Heaven forbid!—she will not in any future age excel in the art of musical composition."

THE *Sunday at Home* begins this month to give the journal of an Albanian colporteur's captivity among the brigands of the Albanian highlands, by whom he was carried off in 1884. Valuable insight into brigand life is conveyed by these vivid memoirs. There are besides interesting sketches of Sunday in Birmingham, with special reference to the adult schools and P. S. A.

THE FRENCH REVIEWS.

THE REVUE DE PARIS.

THE long awaited new French Review has at last made its appearance, and bids fair to prove a formidable rival to the old established *Revue des Deux Mondes*. Both February numbers attain a very high level both as regards noted contributors and excellence of contributions, although they do not always go hand in hand.

NOTEWORTHY ARTICLES OF FIRST NUMBER.

Two writers who have passed away forever are given the place of honor in the first number: Honoré de Balzac with "Letters to a Foreign Lady," consisting of the great novelist's long correspondence with Madame Hanska, the fair Russian who ultimately became his wife; and Ernest Renan, with an article which gives a striking description and sums up the life-work of Philo of Alexandria. The historian of the Jews, though he admits that the Alexandrian philosopher had much in common with Christian theology, entirely denies that he ever became a follower of our Lord; and this, although Philo has been at times mentioned as one of the Fathers of the Church.

In the same number Pierre Loti describes Loyola's Convent, noticed elsewhere. The editor of the *Figaro*, Francis Magnard, discusses the rise of the Napoleonic Legend; Emile Faguet contributes a kindly but critical article on Pierre Brunetière, the latest elected Immortal and new editor of the *Revue des Deux Mondes*; and J. J. Jusserand, the well-known authority on Mediæval England, tells the life romance of James I, the poet-king of Scotland, who, when a prisoner at Windsor, fell in love with Joan of Beaufort.

ERNEST RENAN.

The most interesting article in the second number of the *Revue de Paris* is that by the veteran, Jules Simon, on Ernest Renan. It is, perhaps, the most satisfactory and true account yet published of the late writer. Like Ernest Renan, M. Simon is a son of wild, picturesque Brittany, and for fifty years he was the closest friend and confidant of the historian. He gives a touching picture of the affection and respect which subsisted to the end between Renan's former friends and companions at the Treguier seminary and himself, even after the publication of his celebrated "Life of Christ." Though he went through some bitter experiences, especially when a young man, Renan always assured those round him that he had been exceptionally fortunate. "He was a great traveler in the world of thought," says his biographer. "I could have wished that his way had not lain by the Abbaye de Jouarre; but it should be remembered that he has also led us to Jerusalem, to Phœnicia, and through Ancient Greece. He had his hours of sadness and discouragement. He was at various times repudiated, calumniated, condemned without right of appeal, and reduced to the worst forms of poverty. His never brilliant health gave way, and he suffered at last from two or three diseases. But even though he could no longer sleep or eat or even hold conversations with those he loved, he would still exclaim, 'I am happy; I have been exceptionally fortunate, and must accordingly give thanks.' His laugh was sometimes ironic, yet oftener joyful. He has left us this fine precept, to do our work singing."

One of the two editors of the *Revue*, M. James Darmstetter, contributes not the least valuable article to the number, for in it he goes over every phase of the social and political history of France during the last twenty-two years—that is to say, since the Franco-Prussian war.

THE REVUE DES DEUX MONDES.

THREE of the articles in the *Revue des Deux Mondes* for February 1 deal with Germany and show a marked change in the attitude of the French press. Their tone is that of calm condemnation and cautious criticism devoid of irritation. The first in point of date is an extract from a diary of Michelet written fifty-two years ago. He left Paris June 20, 1842, and by way of Metz and Strasburg entered Germany. In the latter city he goes first to the Cathedral and next to the town library, where he makes a curious reflection. "The books, the contents of the Museum, are a mixture of France and Germany. There is here truly marriage between the two nations. Nothing can be more touching. I shut myself up there for hours, reading, interrogating the past. Beneath my eyes is a relic—the little old Cathedral of the town with the date of 1388, which serves as model for the arms of the corporations of Strasburg." Be it remembered that in 1842 Strasburg was French. But across the Rhine goes the comparatively young Michelet of fifty years ago, keeping his eye upon the gray mountains of his native France, "land of strong and valiant men, may I retain somewhat of thee!"

BLUM AND BISMARCK.

The third article is a review by Monsieur "G. Valbert" of Herr Blum's History of the German Empire from 1871 to 1890. This is a work which was undertaken under the good auspices of M. de Bismarck himself. But there came a time when the Chancellor withdrew his encouragement, the cause being certain statements concerning Count d'Armis, the German Ambassador in Paris, suspected of financial relations with the notorious Baron Hirsch. The end of it was that Prince Bismarck published a denial of any interest in M. Blum's book, said he had not read it, and had forbidden any one to speak to him upon the subject. This was especially hard, because Blum professed for Prince Bismarck an "admiration without limit and without reserve." "Whether it were a question of foreign policy, of home administration, of taxes or customs, he approved everywhere and always, and even forgave Bismarck when the latter reconciled himself with the Pope." But more remarkable than anything said or thought by M. Blum is the entire impartiality of M. Valbert, who remarks that "if M. de Bismarck made many enemies, it is just to observe that he brought them down upon himself as much by the superiority of his political genius as by his despotism, his haughtiness, and the severity of his demands." M. Valbert discusses the enemy of France as Macaulay might have discussed Marlborough, if the general had been a Frenchman or a Jacobite. France no longer pays to Germany the involuntary tribute of anger, but treats her as a rival to whom she can now afford to be disdainfully just.

THE NOUVELLE REVUE.

BOTH February numbers of *La Nouvelle Revue* contain articles of exceptional interest. The first number opens with forty-seven unpublished letters addressed by Napoleon the First to Fouché, his Minister of Police, Eugène Napoleon, when the latter was Viceroy of Italy, Marshal Victor, Governor of Berlin, and to a number of more or less intimate friends. They are chiefly interesting as giving a clear idea of the great emperor's epistolary methods and directness of vision, and spread over a period of eleven years, from 1804 to 1815.

The *Nouvelle Revue* of February 15 opens with a curi-

ous account of Napoleon the First's dealings with the Jesuits. He apparently regarded them as his worst enemies, and all his generals had orders to search the monasteries in every country they conquered. The article has evidently been written to excuse the laws lately enacted against the religious orders by the French government.

THE PSYCHOLOGY OF CLOTHES.

G. Ferrero contributes a curious article on the "Psychology of Clothing." He declares that from all time human beings have always devoted a considerable amount of thought to the ornamentation of their persons. In Madagascar the king alone wears red; and the same law obtained in France during the Middle Ages, only then scarlet was reserved for the aristocracy. In widely different civilizations various forms of clothing have constantly been made the subject of legislation and the mark of special rank or honor. Therefore, observes M. Ferrero, the historian and sociologist should make a special point of understanding the various fashions of the people he is studying, for it will be found that there is always a close connection between the various fashions of clothing and the social and political condition of a nation. A zoölogist can build up an animal from a single bone. In the same fashion an historian and a sociologist ought to be able to describe the exact condition and civilization of a people even

though they possessed no other indication than what was suggested by their fashion plates. There, where you find that splendid brilliantly-colored garments were worn by the governing classes, and dull poor habiliments by the rank and file, you may affirm, without fear of contradiction, that an aristocratic or military government was in power. This was the case with Uganda, Ancient Assyria, etc. On the other hand, if you are told that in any given nation all classes dressed more or less alike, you may feel sure that a democratic form of government obtained. Clothes have played a great part in the revolutions and wars of the world; even during the Byzantine Empire we hear of the two political parties styled the Reds and Blues, according to the color of their caps; and in the Italy of to-day the Radicals are Red, the Monarchists are Blue, the Clericals are Black. Everywhere in the world, remarks M. Ferrero, the priests and the soldiers always wear a distinctive uniform. Indeed, any kind of special clothing is at once noticed and respected accordingly. A dwarf in a policeman's uniform inspires far more terror in the mind of the evil-doer than a giant in every-day clothing.

Other valuable articles deal with "Contemporary Spanish Literature," "The French Provinces," and "The Literary Personality of M. Brunetière," the new Academician and Editor of the *Revue des Deux Mondes*.

THE WESTÖSTLICHE RUNDSCHAU

A NEW magazine has appeared in the field of European periodical literature, introducing itself as the "*Westöstliche Rundschau Politisch-literarische Halbmonatschrift, zur Pflege der Interessen des Dreibund, Leipzig, 1894.*" Pp. 80. As its name indicates, this German semi-monthly is devoted especially to the interests of the "Triple Alliance" of Germany, Austria, and Italy, urging the necessity of united action and preparation to meet what is regarded as a near invasion of Europe, once more, by the semi-barbarous hordes of Russia now in secret alliance with France. The first number of this new comer has already excited great attention in European political circles. Its staff of contributors, already numbering two hundred and twenty persons, among whom are names of eminence in literary culture as well as of political and military note, is surprisingly large, and with the editor-in-chief, Dr. Karl Siegen, of Leipzig, is more than sufficient guarantee of the first-rate quality of the articles that will appear in its pages. In the words of the editor, the magazine "represents the mighty family of patriots in Germany, Austro-Hungary and Italy now exposed to the impending danger of a new Asiatic invasion of the blooming fields of European culture-life, and the problem consists in the gathering of all the powers of the civilized world in order to avert the danger. The greatness of it appears not only in the animated and prodigious means and might of the united peoples, but also in the irresistibility inherent in the thought all over Europe that the utmost opposition to destructive barbarism is the moral task of all civilized nations." Germany arms in the interest of peace. Austria stands guard with Hungary on the threshold of the Orient. Italy, burdened by financial embarrassments, shrinks not from the union, and seeks hereby her way out to the completion of her independence. England's moral support, perhaps more, must gravitate to the "Dreibund."

France throws herself into the arms of Russia and is on the spring ready to avenge her late humiliation. Russia, never satisfied, plies her Oriental intrigues more than ever, her eyes fastened on India, the Balkan, Asia Minor and Egypt. The future of civilized Europe depends upon the Peace-Bond of her nationalities supported by the whole might of her military force.

A FINNISH MAGAZINE.

FINSK TIDSKRIFT is an admirably conducted magazine, published in Helsingfors, Finland, by T. Gustafsson and M. G. Schybergson, but printed in the Swedish language. It is devoted to literature, science, art and politics, and presents, therefore, a bill of fare at once bright and solid, and full of variety. In the February number M. G. Schybergson continues his long and intensely interesting biographical study of Mikael Speranski, once the favorite statesman of Alexander I, afterward the victim of intrigue and slander, and, for no very clear reason, thrown off by the Czar who made no secret of believing him innocent of all treachery and wrong doing. There can be no doubt, however, that Alexander felt the loss of Speranski very keenly, and, whatever the real motive might have been that led him to exile the favorite who had shown such devotion to him, almost regretted the step he had taken. The day after, Prince Galitzin, who appeared by command before him, found the Czar pacing his room gloomy and disturbed. On the Prince inquiring if he were ill, Alexander returned, almost tearfully: "No; but if your hand had been cut off, you would surely groan and complain at your hurt; I was robbed last night of Speranski—he was my right hand." During the whole lengthy conversation with Galitzin the Czar spoke only of his heavy loss, often with tears in his eyes. "You and Moltschanroff," he said at last, "will search Mikael Mikailovitch (Speranski's) papers, but you will find nothing—he is no traitor."

THE NEW BOOKS.

"MARCELLA." *

MRS. HUMPHRY WARD'S NEW NOVEL ON
SOCIALISM AND WEALTH.

WHATEVER the judgment of the critics may be,—and these lines are written before any of the critics have said their word,—we may confidently predict, from a rapid advance reading, that Mrs. Humphry Ward's "Marcella" will be pronounced her best book by the pub-

MRS. HUMPHRY WARD.

lic who read to enjoy and to learn rather than to criticise. Quite as truly as "Robert Ellsmere," "Marcella" is a story of immediately contemporaneous life and thought. It is more readable, considered as a story, than "Robert Ellsmere" or "David Grieve." As a vehicle for the discussion of current social problems, it is by far more lucid and more satisfactory than either of its predecessors. It carries us into the very heart of the politico-economic movements and controversies that occupy so central a position in English life and society to-day.

* Marcella. By Mrs. Humphry Ward. Two vols., 12mo, pp. 447-498. New York: Macmillan & Co.

Marcella Boyce is the daughter of a younger son of a landed proprietor of ancient and aristocratic lineage. This second son has gone into Parliament at an early age and has married young. His prospects have been brilliant, but his moral nature is unsound, and at length he brings disgrace upon his family by dishonest and swindling financial transactions which are exposed and which cause his complete downfall. His father saves him from punishment as a criminal by the payment of heavy sums of money which almost impoverish the estate, and the old man dies soon afterward. The elder son Robert Boyce succeeds to the estate, and the disgraced younger son Richard Boyce disappears from view. Richard's wife, through all his misconduct, has clung to him with tenacity and unswerving devotion, though the effort at self-control at length results in a strangely reserved and unsympathetic nature. They have one child, Marcella, the heroine of the story. She is sent to a second-class boarding school at the age of nine, and sees nothing of her parents except in brief vacations for many years. Uneventful boarding school life continues until she is nineteen.

Meanwhile, from a plain and forlorn childhood, in which she has shown strong impulses and great individuality, Marcella has developed into a young womanhood of rare beauty and strength of mind and character. At nineteen she is taken from her rural boarding school and allowed to spend a time in London for the study of art and music in connection with the South Kensington schools. She has strong artistic aptitudes and predilections, but circumstances bring her quickly into contact with the philanthropic movements, and more particularly with the socialistic propaganda, of present-day London. One of her companions, a young lady art student, has two brothers who are art designers by profession, and ardent upholders of the socialistic ideal. They are active members of the "Venturist Society." Readers who are at all familiar with London life and movements will at once recognize the well-known Fabian Society under this disguised name. The Fabians, as a group, are men and women of high culture and sincere devotion to human progress. Marcella Boyce throws herself with the earnestness which is the key to her nature into work for the London poor under the guidance and according to the methods of the new school of humanitarian socialism.

But when Marcella reaches the age of twenty-one, having been two years in London, her father succeeds through the death of his elder brother to the family estates at Mellor, and Marcella is summoned to the home of her ancestors. In London she has imbibed the socialistic abhorrence of wealth, and has come to believe that private property, especially in land, is the chief social curse. Her position at Mellor, therefore, is a highly interesting one. She finds herself passionately in love with the place and its traditions, yet greatly in doubt as to the rightness of the English system of landlord proprietorship. She finds Mellor in a sadly decayed and neglected condition, and she is horrified at the wretched condition of the people in the agricultural village which belongs to the estate. She has not been told of her father's early offenses, and does not for a time understand why he is not received by the

old county families, especially by Lord Maxwell, who owns the adjoining estate.

Through her interest in the villagers and her participation in charitable work, Marcella becomes acquainted with Aldous Raeburn, Lord Maxwell's grandson and heir. He is a man of thirty, of university training, conservative by instinct, quiet and reserved, but of high ideals of duty and justice, and possessed in the fullest degree of a sense of the responsibility imposed upon a man of his class. He falls in love with Marcella, and soon afterward they are engaged. Not to dwell too minutely upon the story, a sharp clash,—growing out of their different points of view as to questions of social ethics,—leads Marcella to break off the engagement. Jim Hurd is one of the poorest and most unfortunate of the villagers. He is led, through want, to the dangerous practice of poaching. Lord Maxwell's gamekeeper, a burly, insolent fellow, has always been an enemy of the deformed and unfortunate Hurd. At length he catches Hurd in the game preserves, and in the conflict that ensues Hurd shoots the gamekeeper and kills him. Marcella, who has been a ministering angel in Hurd's family, uses every effort to secure a reprieve of the man's death sentence. Aldous Raeburn's sense of duty will not allow him to sign a petition for the act of clemency.

Marcella breaks off the engagement, leaves her home, and goes to London, where she enters upon the work of a nurse among the poorest of the poor, taking to London with her Jim Hurd's widow and small children. A new and prominent character has meanwhile been introduced into the story in the person of a young Mr. Wharton, who has talent and ambition, and who thinks he sees in the cause of socialism an opportunity to advance his own fortunes. He is a distant relative of Lord Maxwell and has become the editor of a powerful London paper which has strong labor and socialistic leanings, and is known as the *Clarion*. Everything in the description of this paper and its influence would point to the London *Daily Chronicle* as the real journal that was in Mrs. Ward's mind. Wharton becomes a labor candidate for Parliament in a constituency which lies adjacent to Mellor, and powerfully espouses Marcella's cause in behalf of poor Jim Hurd. Wharton's interference aids in the breach between Marcella and her lover, and in Marcella's subsequent London life and work Wharton reappears from time to time. His career as a labor leader finally comes to an end through the exposure of the fact that he has taken a large bribe from an association of mine owners in order to induce him to advocate in the *Clarion* a cessation of a miners' strike, the continuance of which had been chiefly due to the *Clarion's* strenuous support of the strikers. Wharton meantime has endeavored to win Marcella's hand, with some prospects of success; but he is rejected, and at once succeeds in capturing the daughter of a Tory lord. He is a strong type of the insincere reformer whose desertion is only a question of time and self-interest.

Aldous Raeburn, Marcella's old lover, has meanwhile become an under-secretary in a Conservative cabinet. In making a practical investigation into certain housing conditions in a poor part of London, he encounters Marcella, who, in her capacity as nurse, had been attempting to protect a sick wife against a drunken husband and has been badly injured by a blow from the infuriated brute. The story develops rapidly, and the encumbering characters are disposed of with all the neatness and dispatch that make the conventional novel so agreeable to the sympathetic reader. Lord Maxwell falls mortally ill and dies on the continent, Aldous succeeding to the title and

the estates; and soon afterward Richard Boyce conveniently ends his unprofitable existence, Marcella being his sole heir.

Thus far we have not alluded to one of the most attractive characters in the story, Edward Hallin. If, in drawing the portrait of Edward Hallin, Mrs. Ward had not in mind the lamented Arnold Toynbee,—who founded Toynbee Hall in East London, lectured to workmen on economic subjects, and died while his work was only begun, leaving a loved and cherished memory,—the ordinary reader will be much deceived by the striking resemblance. Edward Hallin had been an intimate Cambridge friend of Aldous Raeburn, and the friendship had grown stronger through the after years. In her London life and labor Marcella had known Hallin as she knew the other reformers, labor leaders and social philanthropists. Edward Hallin's dying days are spent with his friend on the Maxwell estate. Raeburn's devotion to Marcella has remained unbroken, and through her hard experiences as a London nurse her appreciation of his high character and worth has constantly grown stronger, and her love for him has grown deeper and more mature. That these two, then, should become reconciled was a foregone conclusion. The story ends at the point where they are about to be married and to join hands and hearts in their life work for the welfare of the people about them.

The doctrines of the book, however, are more important than the story,—though considered as a piece of fiction it is certainly an artistic and charming product. Upon the whole, the book must be regarded as a defense of wealth and landed property from the point of view of the social well-being. It preaches no selfish doctrine of wealth, but rather the doctrine of social responsibility. It does not defend the existing order with blindness, nor does it unfairly distort or caricature the doctrines and ideals of the brave and honest men who are leading the socialistic propaganda in London. But it constitutes, in essence, a plea for progress upon the basis of character and individual freedom, as against all proposals for a sudden or violent overturning of long-established institutions. Specifically, it may be considered an argument against the nationalization of land. In general, it controverts the collectivist ideal. In England the book must perforce create much discussion by reason of the great intimacy with which it deals with movements of the day, and by reason of the further fact that many of its characters seem to be drawn almost too closely from well-known personages. In America it will be of value to all those who would like to understand better the ins and outs of the social and economic agitation that centers in London, and the part that social-economic questions play in the public and private life of England in this closing decade of our century. Mrs. Ward has certainly achieved a remarkable success in this third serious novel of modern social and ethical life.

MR. CRAWFORD'S NEW STORY OF NEW YORK SOCIETY LIFE.*

"**K**ATHERINE LAUDERDALE," which has just been published in two volumes (an American novel in two volumes is something of a rarity since the days of Cooper), introduces us to a number of people,

* Katherine Lauderdale. By F. Marion Crawford. Two vols., 12mo, pp. 332-336. New York: Macmillan & Co. \$2.

about whose fortunes Mr. Crawford proposes to tell us still more in a future story or stories. The world in which the characters of the new novel live and move and have their love affairs is that of contemporary good society in New York City; it borders upon, when it does not overlap, the circle of the "four hundred," and a number of the novelist's character delineations are said to have been sketched from real and well-known society people. Mr. Crawford has given us to understand, in a few pregnant sentences occurring here and there in the course of the narrative, that the mental and spiritual condition of this upper class is not Elysian, although most of his characters possess "things good in themselves, besides great wealth—such as beauty, health, a fair share of wit and the cheerful heart without which all else is ashes." Katherine Lauderdale herself, though a sensible young woman of nineteen years and not particularly speculative, is adrift religiously: she might under certain conditions be fascinated by theosophy, psychical research—by any theory or knowledge which would satisfy the demand of the anxious soul. "The mind of the idle portion of American society to-day reminds one of a polypus whose countless feelers are perpetually waving and writhing in the fruitless attempt to catch the very smallest fragment of something from the other side, wherewith to satisfy the mortal hunger that torments it."

But while Mr. Crawford has given the picture of a certain society class, and while he has here and there thrown in sentences which generalize a truth with such force and succinctness that they might pass into proverbs; while he has also localized the events of the story by deft touches picturing certain city quarters or certain street scenes of the metropolis, it is with the characters themselves—not a large group—and with the series of somewhat startling events which furnish the narrative of the tale that the reader is principally concerned. The minor personages of the drama are drawn with distinctness and care; but for their more complete history we must await the sequel. Of Pa l Griggs, the cynical and successful author; of Crowdie (evidently a carefully chosen name), the famous painter, with ugly features and repulsive, snake-like manners; of the old millionaire "Robert the Rich," and of several other characters we are anxious to know more.

Katherine Lauderdale is the daughter of a miserly, but well-to-do New York business man of strong Presbyterian preference, and of a Catholic mother who is something of an artist, who was once a brilliant Kentucky belle, and is still known as one of the most beautiful women in metropolitan society. Mr. Crawford's newly created heroine may be sketched in his own language: "She was a very beautiful girl. . . . Yet there was something puzzling in the face, primarily due perhaps to the mixture of races. The features were harmonious, strong, and on the whole noble and classic in outline, the mouth especially being of a very pure type, and the curved lips of that creamy, salmon rose-color occasionally seen in dark persons." Katherine's "deep gray eyes, almost black at times, had an oddly fixed and earnest look. In them there was no softness on ordinary occasions. They expressed rather a determination to penetrate what they saw, not altogether unmixed with wonder at the discoveries they made." Her lover, a cousin by the name of John Ralston, is a rather dissipated young man of twenty-five, the only son of a widow of a United States navy officer. Ralston lives with his mother in a comfortable Fifth Avenue home, and has at the time of the story not succeeded in finding the particular line of effort for which nature has adapted

MR. F. MARION CRAWFORD.

him, and his income was not sufficient to support a wife upon a scale befitting his place in the social ranks.

Katherine urges upon her lover and obtains his consent to a secret marriage, in the hope that she might, by revealing it to the wealthy old uncle, "Robert the Rich," win from him the promise to give Ralston another chance to make his way in the business world. The old millionaire is especially fond of Katherine, but he has twice tested Ralston's power to apply himself to routine duties and the result has been unsatisfactory. Katherine's visit to the uncle is unsuccessful, but it is one of the strong scenes of the novel. Her husband's visit to the same quarter a little later ends in a violently angry debate, which argues ill for the future relations of Ralston and his uncle.

The action of the story is crowded into the space of a few days, lasting from Monday afternoon to Friday afternoon of a winter week. Katherine and Ralston are secretly married in accordance with her wish. The hero has frankly told Katherine a few days before their marriage that he was somewhat under the influence of the drink habit. Upon the day of that marriage Ralston goes through a series of rather strange adventures upon the streets of New York; his friends, his mother and his bride all suppose him to be drunk, but they are mistaken. The testimony of an old family doctor convinces Ralston's mother and the city press that the peculiar condition of the young man's brain and his encounter with a professional prize-fighter were not due to drink, but to an accident, which stunned and confused him. Katherine and her husband met at a young people's dinner party, she cold as ice at his shameful offense; he stern with the sense of being unjustly accused; but his explanation is completely satisfactory, and the second volume closes with a charming reconciliation between the young husband and wife, which the reader, however, feels may be only temporary.

An excellent portrait of Mr. Crawford is used as frontispiece, and Mr. Albert Brennan has enforced some of the important events of the story by full-page illustrations.

TOLSTOI AS A CHRISTIAN ANARCHIST.*

IN his latest work Count Tolstoi appears once more as the teacher and preacher of what he conceives to be the good news of Jesus Christ. He enforces again the prohibition of evil-speaking, of debauchery, of oaths and of resistance to evil. The doctrine of non-resistance is the diapason of his whole discourse. But he delivers his old message in deeper tones and in a nobler dialect. He surrounds it with an ampler atmosphere of history and philosophy, and seeks for it a profounder basis in religion. He recognizes now, as he failed adequately to recognize before, that he was by no means the first to discover from the teaching of Jesus the obligatoriness of non-resistance. He acknowledges that the doctrine of non-resistance to evil by force has been professed by a minority of men from the very foundation of Christianity. He vigorously criticises the majority, believers and unbelievers, who hold the opposite view.

The early corruption of Christianity, Tolstoi, indeed, grants to be as inevitable as the decay of germinating seed in the soil. But as the new life went on developing within the decadent forms of pagan society, the meaning of Christianity became ever clearer and clearer, until at the present time, though Church and State are both still essentially pagan, it pervades and dominates the conscience of mankind. That we are all children of God and brothers of each other, and that love is the true law of life, are principles which Tolstoi with astounding optimism declares to form the real conscience of modern humanity. But with this generally diffused conscience modern conduct is in glaring contradiction. Universal military service and the consequent possibility of mutual murder on the largest scale show that "pagan life has reached its extreme limit and must annihilate itself." The transition to the Christian stage is inevitable.

How is this to be brought about? Certainly not by further extension of the sphere of government, as in international arbitration and kindred schemes. For these Tolstoi has the utmost scorn. "Government is in its essence always a force acting in violation of justice." It is based on the very negation of non-resistance. "Christianity destroys all government." Nor must we wait for

society to take the leap into the new life all at once. As a swarm of bees moves from one branch to another by each separate bee using its own wings, so each individual man should use his own freedom to obey the law of Christ and to detach himself from pagan ways of life.

Tolstoi has gone beyond the literalism which seemed once to mar his interpretation of the Sermon on the Mount. Precise rules, he says, belong to the social and pagan state. Jesus laid down principles which are not to be mistaken for rules, but which point to the eternal ideal. His five (negative) commandments are "signposts on the endless road to perfection."

But is the individual free so to obey Christ? This question brings out Tolstoi's theory of freedom. Man may not be free as regards his acts, but he is free as regards the causes of these acts. He is free to recognize and profess the truth. "And the truth shall make you free." But he is not free to recognize all truths. Some truths, already built into universal custom, he recognizes of necessity. Others, not yet reached by human evolution, he cannot recognize. But between these lie the truths which he is free to recognize. Recognition or non-recognition depends on no external causes. Hence, to recognize the truth now within range is the supreme duty; to refuse to recognize it is to be guilty of hypocrisy, which was the sin Jesus most strongly denounced. Even if you will not carry out in act Christ's anti-coercive precepts, pleads Tolstoi, at least do not play the hypocrite and deny or treat lightly the contradiction between the Christian conscience and our cruel social organization. Recognize and profess the truth, and gradually the action of men will follow the increasingly recognized truth.

For after individual obedience Tolstoi acknowledges the education of public opinion as the second instrument of change. As the few in deed and the many in thought come to recognize the colossal folly and wrong of government, the inevitable transition will take place.

When? That depends, answers Tolstoi, on your will and the will of other individuals. But come it must, sooner or later.

To what will the change bring us? "What will become of humanity if each of us performs the duty God demands of us?" What of civilization, science, art, culture? Tolstoi frankly confesses that we do not know. The law of life is to move on from the known to the unknown: only that is progress. We must conform to truth at all costs: only what is false will perish by our conformity. Wholly in the power of the Master, in the workshop erected and directed by Him, am I to shrink from carrying out His orders, because they seem strange and I do not know His final aim?

*"The Kingdom of God is Within You." By Count Leo Tolstoi. 12mo, pp. 378. New York: Cassell Publishing Company. \$1.50.

OTHER RECENT AMERICAN PUBLICATIONS.

CIVICS, POLITICS, ECONOMICS AND HISTORY.

The Laws and Jurisprudence of England and America. A Series of Lectures delivered before Yale University by John F. Dillon, LL.D. Octavo, pp. 447. Boston: Little, Brown & Co. \$4.

This work by Judge Dillon deals with the subjects of legal education; trial by jury; the origin, development and characteristics of the common law; written constitutions; legislation; case law; law reports; the doctrine of judicial precedent; codification and law reform. The purpose of the lectures is to set forth the merits of our legal system as adapted to the needs of our polity.

Compendium of Transportation Theories. Kensington Series—First Book. Octavo, pp. 295. Washington: Kensington Publishing Company. \$2.

This is a convenient collection of recent papers and addresses on various phases of the railway problem by such well-known experts as Charles Francis Adams, Jr., Judge T. M. Cooley, Joseph Nimmo, Jr., C. P. Huntington, Prof. H. C. Adams, Theodore Voorhees, W. M. Acworth, of London, and other competent specialists. A number of the addresses are reprinted from the proceedings of the National Conventions of Railroad Commissioners. Others have appeared from time to time in the technical railroad journals and in other peri-

odicals. This compendium was prepared by Mr. C. C. McCain, of the Interstate Commerce Commission.

Social Evolution. By Benjamin Kidd. Octavo, pp. 354. New York: Macmillan & Co. \$2.50.

The writer of this work seeks to apply the principles of evolutionary science, as interpreted by the Darwinian school, to the study of race development. These principles, he thinks, have been too generally neglected by students of social economics. "The gradual emancipation of the people and their rise to supreme power has been in our case the product of a slow ethical development in which character has been profoundly influenced, and in which conceptions of equality and of responsibility to each other have obtained a hold on the general mind hitherto unparalleled. The fact of our time which overshadows all others is the arrival of Democracy." Especially interesting chapters are those on "The Outlook," "The Central Feature of Human History," "The Function of Religious Beliefs in the Evolution of Society," "Western Civilization" and "Modern Socialism."

The Englishman at Home: His Responsibilities and Privileges. By Edward Porritt. 12mo, pp. 393. New York: Thomas Y. Crowell & Co. \$1.75.

This work aims to render for American readers such a service as Mr. Bryce, in the "American Commonwealth," rendered for English readers, in illuminating the institutions of a kindred people. The author deals with the various departments of municipal and national life in England, describing those features with which Americans generally are least familiar. "The Poor Law and Its Administration," "National Elementary Education," "Administration of Justice," "Imperial Taxation," "The Church of England and Nonconformity," "Labor Legislation" and "The Daily Press" are among the chapter headings. Mr. Porritt's journalistic experience in England and the United States well qualified him for the task of preparing such a work as this.

The Sunset Club of Chicago. The Meetings of 1892-93 and a List of the Members to January, 1894. Octavo, pp. 244.

This modest volume contains reports of discussions of present-day topics at a dozen meetings of the Sunset Club during the season of 1892-93. Many prominent business and professional men of Chicago, with invited guests, contributed to these discussions, which have a permanent value and interest to the student of political and social problems. Of especial importance are the suggestions relative to municipal reform.

Bimetallism; a Tract for the Times. By Francis A. Walker. Paper, octavo, pp. 24.

President Walker discusses in this brochure the three questions: Is bimetallism economically desirable? Is it economically practicable? and is it politically and diplomatically possible? The well-known position of General Walker on the monetary question would sufficiently suggest to the reading public his answers to these questions. He outlines the true policy of the United States for the present as one of waiting and educating. "Bad as the situation is for each and for all, we can stand it longer than Europe. We are richer, freer, stronger than the greatest of the nations; we have a much wider margin of living; we have vast undeveloped resources which contain the possibilities of indefinite wealth."

The Political Economy of Natural Law. By Henry Wood. 12mo, pp. 305. Boston: Lee & Shepard. \$1.25.

This is a fuller development of the ideas advanced in the author's "Natural Law in the Business World," which appeared several years ago. Mr. Wood discusses from the point of view of evolution and natural law such subjects as combinations of capital and labor, profit sharing, socialism, economic legislation, distribution of wealth, centralization of business, booms and panics, money and coinage, tariffs and protection, etc.

The Referendum in America. A Discussion of Law-Making by Popular Vote. By Ellis Paxson Oberholtzer, Ph.D. Octavo, pp. 225. Philadelphia: The University of Pennsylvania. \$1.50.

Defining the Referendum as "the submission of laws, whether in the form of statute or constitution, to the voting citizens for their ratification or rejection, these laws first having been passed upon by the people's representatives, assembled in legislature or convention," Dr. Oberholtzer finds that this is no new principle in America, but that it is employed in every State, as well as in the county, the city, the township

and the school district. The present essay gives the results of an investigation into the actual application of this principle in the different States. The subject is discussed under four heads—"Constitutions and Their Amendments," "Submission of State and Local Laws," "The People and Their City Charters," and "Opinions of State Courts" as to the constitutionality of law-making by popular vote. An appendix of 75 pages contains a useful summary of State constitutions, including all instances in which the right of the people to a direct consultation in the making of their laws has been recognized in these instruments, as well as examples from the statutes.

The Railways of Europe and America; or, Government Ownership. By Mrs. Marion Todd. Paper, 12mo, pp. 293. Boston: Arena Publishing Company. 50 cents.

Mrs. Todd summarizes the railroad statistics of the United States, India, Germany, Austro-Hungary, and other countries, with reference to the question of government ownership. The "zone systems" of Austria and Hungary receive special attention.

A History of the United States Navy from 1775 to 1893. By Edgar Stanton Maclay, A.M. In two vols. Vol. I. Octavo, pp. 609. New York: D. Appleton & Co. \$3.50.

Mr. Maclay undertakes to tell in two volumes the story of our national naval exploits from the outbreak of the Revolution down to the present time. The first volume covers the period 1775-1813, breaking off in the middle of the War of 1812. The record of our young navy's achievements, as every one knows, is of surpassing interest. What we have lacked heretofore has been a complete, continuous narrative, although there are several excellent works dealing with special periods. The time that Mr. Maclay has devoted to this work has been well spent. In particular, he is to be congratulated on the discovery of most important documents in the archives of the French Navy Department in Paris which enable him to throw much new light on our troubles with France in 1798-1801. He believes this chapter in our national history to have been a most interesting and glorious one. The work is well supplied with admirable maps and illustrations.

The History of Australia and New Zealand from 1606 to 1890. By Alexander Sutherland, M.A., and George Sutherland, M.A. 12mo, pp. 253. New York: Longmans, Green & Co. 90 cents.

This brief manual is adapted to the use of schools; it is also a convenient book of reference for the American reader who wishes to inform himself on the leading facts of Australian history. Such topics as the early discoveries, the convict settlements, the gold excitement, later explorations, and methods of colonization, are treated with sufficient fullness and in a manner that can hardly fail to interest the general reader.

PHILOSOPHY AND RELIGION.

Science and Christian Tradition. Essays by Thomas H. Huxley. 12mo, pp. 453. New York: D. Appleton & Co. \$1.25.

One of the most interesting features of the volumes now appearing in Mr. Huxley's series of "Collected Essays" is found in the recently written prefaces. The preface to "Science and Christian Tradition" is decidedly spicy; severely and at the same time humorously polemical. While referring to the testimony of the Gospels as being, for himself, incredible, Mr. Huxley states that "refusal of assent with willingness to reopen the question, on cause shown, which is what I mean by Agnosticism, is, for me, the only course open." The essays of this volume (the fifth of the series) all belong to the period from 1887 to 1892 and discuss such questions as "Scientific and Pseudo-Scientific Realism," "Possibilities and Impossibilities," "Agnosticism," "The Keepers of the Herd of Swine," "Mr. Gladstone's Controversial Methods," etc., etc.

Secularism: Its Progress and Its Morals. By John M. Bonham. 12mo, pp. 400. New York: G. P. Putnam's Sons. \$1.75.

Mr. Bonham, the author of "Industrial Liberty" and other works, believes every great world religion and religion itself mark only certain stages in the development of the race. It seems to him that a scientific secularism which will examine all subjects with the same calm rationality, unhindered by any sentiment of "reverence," is to be dominant in the near future. The present organization of our industrial life is

hastening the day when theology will be obliged to give up the ghost. Mr. Bonham's style is clear and philosophical; he treats his subject as a student of general tendencies, and has not made any extensive appeal to statistics in these chapters.

Religion in History and in Modern Life. By A. M. Fairbairn, D.D. Octavo, pp. 286. New York: Anson D. F. Randolph & Co. \$1.50.

This new edition of Doctor Fairbairn's volume of lectures is in response to public demand. Touching upon somewhat the same topics which are discussed in Mr. Bonham's book the author looks at the functions of Christianity as one whose "hope for the future is in the ideal of Christ, whose hope for man is in a more perfect and complete embodiment of the Christian religion." The lectures, while largely historical in a direct way, have for their purpose the understanding of the relation of the Christian Church to our own times, and especially to the social-industrial problem. Doctor Fairbairn considers himself a student of religion rather than a student of economics.

Religion. By G. de Molinari. Translated by Walter K. Firminger. 12mo, pp. 207. New York: Macmillan & Co. 90 cents.

Mr. Firminger's object in translating this work (from the second French edition and with the sanction of the author) has been, in part, to throw some light upon the English problem of Church disestablishment. M. Molinari, editor of the *Journal des Économistes*, reaches the conclusion in this book, which "is a plea in favor of the independence and liberty of creeds," that the separtion of Church and State is an imperative demand of progress. The author, writing as a reverent and thorough lay student of religion, has uttered many important truths regarding the social functions of religion, its origin and future, and its relations to the scientific modern era.

A Short History of Unitarianism Since the Reformation. By Frederick B. Mott. 12mo, pp. 91. Boston: Unitarian Sunday School Society.

Mr. Mott has chosen to sketch the progress of Unitarianism by means of the biographical method. He has given brief summaries of the life and doctrinal position of Erasmus, Servetus, Sozzini, Priestley, Emerson, Theodore Parker, Martineau and others. A series of such outlines, treating clearly the essential history of each great denomination, might find place in Sunday school work and be useful in breaking down so much of the prejudice of sect as rests upon ignorance.

The Spirit of God. By P. C. Mozoomdar. 12mo, pp. 323. Boston: George H. Ellis. \$1.50.

The general spirit and style which obtain in this volume are the same which the readers of "Heart-Beats" found. Mr. Mozoomdar writes in the preface: "I do not pretend to be a scholar or theologian or teacher. My utterances are only my personal record." A sense of mystery and of longing, a conception of God which to many may seem vague, a profound religious experience and a terse and figurative style dominate these chapters upon "Hindu Doctrine of the Spirit;" "Doctrine of the Spirit in Christianity;" "The Spirit in Nature;" "Spiritual Power of the Senses;" "The Spirit in Immortal Life;" "The Spirit in History," etc., etc. It is a volume in which the scientific demand will find scarcely a recognition, but which as literature and as religious contemplation deserves high rank.

CRITICISM, ESSAYS AND BELLES-LETTRES.

The Experimental Novel, and Other Essays. By Émile Zola. Translated by Belle M. Sherman. 12mo, pp. 419. New York: Cassell Publishing Company. \$2.

The contents of this volume first appeared, in the original French, in the columns of various Continental reviews. A reader who does not feel disposed to follow the application of M. Zola's theory of fiction throughout the list of his novels will find that these essays present clearly and emphatically (and with many repetitions) the critical formulas upon which the art, or rather the science, of Zola's creations rests. The style of these chapters is diffuse and polemical, but it is clear, and the statements are definite. The business of the novelist is to study the phenomena of human passion, to reduce the territory of the unknown, to search for the "how," not the "why," to do battle with the "lies of the idealists," to pass beyond the wordy rhetoric of the romanticists. "The naturalistic formula in literature . . . is identical with the naturalistic formula in the sciences, and particularly in physiology. . . . We do not deny God; we endeavor to mount up to Him by reaching an analysis of the world. If He is at the head of it all we shall find it out, science will reveal it to us."

Oxford and Her Colleges: A View from the Radcliffe Library. By Goldwin Smith, D.C.L. 32mo, pp. 105. 75 cents.

In this pocket companion Professor Goldwin Smith writes of his beloved and familiar university with the view of giving an historical outline which might especially interest American visitors at Oxford. He has shown the close relation between the college life and the larger general life of England, and explained the complex university organization. A view of Radcliffe Library is given as a frontispiece.

Wills and How Not to Make Them; with a Selection of Leading Cases. By B. B. West. 16mo, pp. 190. \$1.

Mr. West's volume is not a serious treatise for the actual assistance of will-makers, but it consists of a series of humorous chapters based upon our fallible human nature and upon some peculiarities of British legal proceedings relating to testaments. These chapters have been grouped under the headings, "Testamentary Abuses," "The Remedies" and "Leading Cases."

POETRY AND HYMNS.

Alaskana; or, Alaska in Descriptive and Legendary Poems. By Bushrod W. James, A.M. 12mo, pp. 402. Philadelphia: Porter & Coates. \$2.

Mr. James, who is a member of the medical profession and a member of several of our American scientific associations, has visited Alaska and has also read the principal literature relating to that region. He has thrown into poetic form—using the metre of *Hiawatha*—a great deal of valuable information and a great deal of excellent description relating to Alaska scenery and the customs and legends of the natives. The result is a volume out of the usual order, which will delight many people who have a fancy for the union of poetry and fact. There are a number of good full-page illustrations. In sending out this second edition of his work the author has taken the opportunity to enlarge it by the addition of several legends.

In Various Moods. Poems. By Stuart Livingston. 12mo, pp. 100. Toronto: William Briggs. \$1.

This slight volume of verse contains a number of sonnets and songs, and some reflective pieces written in blank verse. Mr. Livingston shows a graceful facility and a real poetic sensibility; in these pages he has not confined himself to themes of love, though they have their share of attention.

Popular Selections from Hymns New and Old. Edited by D. B. Towner, T. T. Eaton and G. H. Simmons. Paper, 12mo. New York: Fleming H. Revell Co. 10 cents.

FICTION.

Union: A Story of the Great Rebellion. By John R. Musick. 12mo, pp. 505. New York: Funk & Wagnalls Company. \$1.50.

Mr. Musick is to be congratulated upon the completion of his pleasant task of outlining the principal events of our national existence in a series of volumes uniting a predominating historic aim with a purpose to furnish good stories. In the last issue of the "Columbian Historical Novels," the romance closes with the closing year of the civil war, while an appendix gives a *résumé* of the chief happenings of importance from 1865 to 1893. The full-page illustrations are excellent, and there are added a number of small portraits of recent Presidents and other public men. Mr. Musick, though he writes from a federal standpoint, believes Lee to have been the greatest general of the war, and his study of John Brown has led him to the belief that the hero of Ossawatimie was "a dangerous fanatic whom it were better to forget than to praise." "The Columbian Historical Novels" seem particularly well adapted for the shelves of our common schools in town and in country. The work has been accomplished with fidelity and according to a definite method.

John Ingerfield and Other Stories. By Jerome K. Jerome. 32mo, pp. 230. New York: Henry Holt & Co. 75 cents.

A pleasing portrait of the young British author accompanies this collection of five short stories, and there are several other illustrations. These products of Mr. Jerome's fancy are about equally divided between the humorously light and the sombrely serious style of fiction.

The Last Sentence. By Maxwell Gray. 12mo, pp. 491. New York: Lovell, Coryell & Co. \$1.50.

Mention of this strong and ably written story has been

made heretofore in this department. It is well illustrated by Albert Hencke and is a notable volume, with plenty of incident and with an excellent moral element, which is not, however, obtrusive.

Life in a Nutshell. A Story. By Agnes Giberne. 12mo, pp. 222. Boston : A. I. Bradley & Co. \$1.

"Life in a Nutshell" is an illustrated English story for girls, and it is of a directly religious character.

A Princess of Paris. A Novel. By Archibald Clavering Gunter. 12mo, pp. 283. New York : Home Publishing Co. \$1.

The Story of Margédel. Being a Fireside History of a Fifehire Family. 16mo, pp. 269. New York : G. P. Putnam's Sons. \$1.

Waring's Peril. By Capt. Charles King. 12mo, pp. 230. Philadelphia : J. B. Lippincott Co. \$1.

Lisbeth. By Leslie Keith. 12mo, pp. 361. New York : Cassell Publishing Company. \$1.

A Soldier and a Gentleman. By J. Maclaren Cobban. 12mo, pp. 211. New York : Lovell, Coryell & Co. \$1.

The Countess Radna. A Novel. By W. E. Norris. 12mo, pp. 405. New York : Lovell, Coryell & Co. \$1.50.

Ai : A Social Vision. By Charles S. Daniel. Paper, 12mo, pp. 296. Boston : Arena Publishing Company. 50 cents.

An Apocalypse of Life. By W. T. Cheney. Paper, 12mo, pp. 312. Boston : Arena Publishing Company. 50 cents.

Ships That Pass in the Night. By Beatrice Harraden. Authorized American Edition. 16mo, pp. 235. New York : G. P. Putnam's Sons. \$1.

The Woman of the Iron Bracelets. By Frank Barrett. 12mo, pp. 433. New York : J. Selwin Tait & Sons. \$1.

Benefits Forgot. By Walcott Balestier. 12mo, pp. 460. New York : D. Appleton & Co. \$1.50.

TRAVEL AND ADVENTURE.

Australia as It Is ; or, Facts and Features, Sketches and Incidents of Australia and Australian Life. By a Clergyman. Third edition. 12mo, pp. 266. New York : Longmans, Green & Co. \$1.75.

The anonymous author of these sketches has chosen a title which correctly reveals the purpose of his volume. He has been a resident of New South Wales for something more than a dozen years, and writes with experience, therefore, as well as in a clear and agreeable style, of the actual facts about "The Bush," "Pioneering," "Squatting," "Convictism," etc., etc. Not only the prospective colonist, for whom the book seems especially prepared, but any one desiring a truthful view of Australian life to-day, in its most characteristic features, may profit by these pages. The volume has reached a third edition.

Among the Matabele. By the Rev. D. Carnegie. 12mo, pp. 128. New York : Fleming H. Revell Co. 60 cents.

The Rev. Mr. Carnegie has had a ten years' residence in Matabeleland in the service of the London Missionary Society and his duties have led him to an intimate acquaintance with the character and customs of the dark skinned people. His book is clearly written and contains not a little information. A map, portraits of Lobengula and Khama and several other illustrations are furnished.

Tales of a Nomad ; or, Sport and Strife. By Charles Montague. 12mo, pp. 216. New York : Longmans, Green & Co. \$1.50.

Mr. Montague has not endeavored to make a piece of literature out of his hunting and fighting experiences. He has recorded the pith of some exciting adventures, mainly in South Africa, "in the hope that they might interest sportsmen and travelers."

ATHLETICS AND OUT-DOOR LITERATURE.

Sandow on Physical Training. Compiled and Edited by G. Mercer Adam. Quarto, pp. 260. New York : J. Selwin Tait & Sons. \$3.50.

Those conversant with the history of the men who have gained the world's admiration for their physical development and power may not be surprised to learn that at ten years of age Mr. Eugene Sandow was a decidedly unpromising boy judged from the standpoint of athletics. The volume which Messrs. J. Selwin Tait & Sons have recently issued informs us how this puny specimen of humanity became at twenty-six the athletic giant who has attained such prominence in Europe and in our own New York. A portion of the work is practically from the words of Mr. Sandow himself. He explains clearly but scientifically his manner of life and his method of training, which method, employing mainly the simplest dumb-bell and bar-bell apparatus, is presented in its details and is worthy to be called a system. The book does not look upon Mr. Sandow merely as an exceptionally strong man and a stage phenomenon, but as—*mutandis mutatis*—something of a model for the average citizen who desires to find the right path toward a vigorous physical state ; a symmetrical muscular, nervous and organic development. The volume contains a large number of illustrations, showing the athlete in various poses, explaining the human muscular system, the dumb-bell exercises, etc., etc. The anecdotal side of Sandow's history has not been neglected, but the serious matter of the book makes it worthy of commendation to the amateur and student of physical training.

The Beautiful Flower Garden. By Schuyler Mathews. Paper, 12mo, pp. 191. Philadelphia : W. Atlee Burpee & Co. 50 cents.

All About Sweet Peas. By Rev. W. T. Hutchins. Paper, 16mo, pp. 131. Philadelphia : W. Atlee Burpee & Co. 20 cents.

Mr. Mathews has written his little manual in a practical way, with the authority of one who knows much about picturesque gardening, and he has adorned the text with several full-page illustrations. The geometrical ideal in a flower garden does not please Mr. Mathews. "The chief beauty of the garden should lie in its flower colors and plant forms, and not in the symmetry of its beds and borders." "All About Sweet Peas" is from the pen of an enthusiastic admirer of those flowers, and the booklet appears now in a revised and enlarged edition.

Amateur Fruit-Growing. A Practical Guide to the Growing of Fruit for Home Use and the Market. By Samuel B. Green. 12mo, pp. 132. Minneapolis : Farm, Stock and Home Pub. Co. 50 cents.

Mr. Samuel B. Green, professor of horticulture in the University of Minnesota, has prepared a little manual for the beginner in that branch of agricultural knowledge. It treats in a practical way of the essentials of the subject and is particularly adapted to the more northerly States of the Union. It is sufficiently illustrated and is substantially and conveniently bound.

Hints on the Art of Landscape Gardening. By Thomas Hawkes. Paper, 12mo, pp. 52. Chicago : J. C. Winship & Co.

Cycle-Infantry Drill Regulations. Prepared by Brigadier-General Albert Ordway. 32mo, pp. 80. Boston : Pope Manufacturing Company.

EDUCATION AND TEXT-BOOKS.

John Amos Comenius, Bishop of the Moravians. His Life and Educational Works. By S. S. Laurie, A.M. Paper, 12mo, pp. 272. Syracuse : C. W. Bardeen. 50 cents.

Pestalozzi : His Aim and Work. By Baron Roger de Guimps. Paper, 12mo, pp. 320. Syracuse : C. W. Bardeen. 50 cents.

Mr. C. W. Bardeen, well-known for many services to the educational world, is issuing month after month a series of volumes which compose a "Standard Teachers' Library." The works which find place in the series are of acknowledged pedagogical value, and they are issued at a price which will make them attainable to the average school-teacher. The volumes devoted to Comenius and Pestalozzi are carefully prepared.

Selections from the Essays of Francis Jeffrey. Edited by Lewis E. Gates. 12mo, pp. 258. Boston: Ginn & Co. \$1.

Mr. Lewis E. Gates, of the English department at Harvard, has made a series of selections from Jeffrey, which serve to show the essential characteristics of the famous Scotch critic and the spirit and methods of the critical art in Great Britain during the early decades of our century. The editor has written a careful introduction and appended a considerable body of notes. An excellent portrait of Jeffrey is a pleasant surprise in a volume mainly intended for text-book use.

Practical Methods in Microscopy. By Charles H. Clark, A.M. 12mo, pp. 233. Boston: D. C. Heath & Co. \$1.60.

The author of this little treatise has had more or less experience in microscopy in our secondary schools, and he has made it his aim to give "to the private worker, in simple and concise language, detailed directions for the many processes that he must learn in order to make practical use of the microscope." There are sufficient illustrations, including seven-teen plates reproducing photo-micrographs.

A Laboratory Course in Invertebrate Zoölogy. By Hermon C. Bumpus, Ph.D. 12mo, pp. 163. New York: Henry Holt & Co. \$1.

Dr. Hermon C. Bumpus, professor of comparative anatomy in Brown University, sends out a second revised edition of his manual, intended to direct the work of students pursuing a laboratory course in invertebrate zoölogy. The species selected for examination, from the lowest animal life to simple tunicates, "are generally forms that can easily be secured and preserved."

Amparo. A Novel. By Enrique Pérez Escrich. Adapted to the Use of Students of English and Spanish by R. D. de la Cortina. Paper, 12mo, pp. 307. New York: R. D. Cortina. 75 cents.

El Indiano. A Comedy in Three Acts. By García de la Vega. Adapted to the Use of Students of English and Spanish by R. D. de la Cortina. Paper, 12mo, pp. 83. New York: R. D. Cortina. 50 cents.

The various publications of Professor R. D. Cortina are familiar to many students of Spanish in this country. The two volumes, "Amparo" and "El Indiano," belong to his "Serie de Cortina," and have reached respectively a second and a third edition. Professor Cortina's simple and valuable method in these two pieces of fiction has been to print the Spanish text upon the left-hand pages and an English translation, following the exact arrangement of the foreign tongue, upon the right-hand pages. A beginner may therefore enjoy a good story and an amusing play and at the same time make linguistic progress without the burdensome company of a dictionary.

A Short French Grammar. By C. H. Grandgent. 12mo, pp. 160. Boston: D. C. Heath & Co. 60 cents.

French Lessons and Exercises. By C. H. Grandgent. Part I. 12mo, pp. 34. Boston: D. C. Heath & Co. 15 cents.

Professor Grandgent's grammar is elementary, and aims particularly at brevity, systematic arrangement, a plain and scientific study of French pronunciation and a treatment of the subjects from the standpoint of the American pupil.

L'Avare: A Comedy in Five Acts by Molière. With Notes by Théodore Henckels. 12mo, pp. 161. Boston: Ginn & Co. 65 cents.

Mr. Henckel's notes are placed at the bottom of the page. He has also furnished an introduction and a particularly full vocabulary.

The Progressive Speller: A Complete Spelling Book. By F. P. Sever. 12mo, pp. 148. Boston: D. C. Heath & Co. 30 cents.

SCIENCE AND TECHNOLOGY.

Elementary Meteorology. By William Morris Davis. Octavo, pp. 367. Boston: Ginn & Co. \$2.70.

This thorough and attractive treatise upon one of the most interesting of natural sciences is from the pen of Professor William M. Davis, of the chair of physical geography at Harvard. While this work is intended primarily for text-

book use and is admirably adapted to that purpose, it will doubtless be useful to any one connected with the United States weather service, or in fact to any reader who wishes an authoritative and yet comparatively untechnical treatment of moisture, winds, clouds, cyclones, rainfalls and all other atmospheric phenomena. The volume is indexed and has a number of illustrations.

Biological Lectures Delivered at the Marine Biological Laboratory of Wood's Holl in the Summer Session of 1893. Octavo, pp. 242. Boston: Ginn & Co. \$2.15.

Most of the lectures brought together in this volume present in substance the results of the original investigations of the lecturer, and they aim to "bring forward the unsettled problems of the day and to discuss them freely." They are written in the spirit of special and scholarly research and treat such topics as "The Fertilization of the Ovum," "Dynamics in Evolution," "The Nature of Cell Organization," "The Influence of External Conditions on Plant Life," etc. Of particularly wide interest are the chapters upon "The Mosaic Theory of Development" and "The Marine Biological Stations of Europe." The illustrations are for the most part simple and directly related to the text.

Celestial Objects for Common Telescopes. By Rev. T. W. Webb, M.A. Two vols. Vol. I. 16mo, pp. 250. New York: Longmans, Green & Co. \$1.75.

This fifth edition of a treatise for amateur astronomers, which appeared originally in 1859, has been revised and much enlarged by the Rev. T. E. Espin. Volume I contains a portrait of Mr. Webb, a map of the moon and a number of lesser illustrations. Mr. Espin has left the original text unaltered where possible and has made his additions in the form of footnotes. The two parts of this volume treat of "The Instrument and the Observer" and "The Solar System."

Telephone Lines and Their Properties. By William J. Hopkins. 12mo, pp. 288. New York: Longmans, Green & Co. \$1.50.

The first edition of Professor Hopkins' compact and practical treatise appeared some months ago. The publication of a new edition has given him opportunity for revision and enlargement.

MISCELLANEOUS.

The "Blue Book" of Amateur Photographers (Sprange's Annual). 1894. 12mo, pp. 382. Beach Bluff, Mass.: Walter Sprange. \$1.25.

Some months ago Mr. Sprange's British edition of his "Blue Book" appeared. It is now followed by the American edition, which constitutes a directory of the amateur photographic societies of the United States and a list of officers and members, with addresses. Some slight information regarding foreign countries is also included, and Mr. Sprange has relieved the monotony of tabular matter by a series of interesting illustrations, from American subjects for the most part. The amount of labor which a volume of this class requires is realized only by one who has had a practical experience of it, and Mr. Sprange's faithful energy is worthy of support by his fellow-photographers.

The Green Bag. Vol. V. 1893. Edited by Horace W. Fuller. Quarto, pp. 576. The Boston Book Company.

The bound volume for 1893 of this well-known magazine for lawyers makes a very attractive appearance, especially in the large number of portraits. The periodical from month to month reflects the lighter phases of the American attorney's professional life in a genial way and the numbers when bound furnish an agreeable and valuable book for the office or home shelves.

The Gist of Whist. By Charles E. Coffin. 16mo, pp. 112. New York: J. Selwin Tait & Sons. 75 cents.

Mr. Coffin has a high respect for his game and his purpose in preparing a manual has been to furnish a concise, reliable guide to modern scientific whist based upon the standard authorities.

The Evolution of Physiological and Chemical Science in a Natural System of Medicine vs. the Theories and Fallacies of Popular Medicine. By J. D. Stillman, M.D. Octavo, pp. 69. St. Louis.

The Genealogy of the Mickley Family of America. Compiled by Minnie F. Mickley. Octavo, pp. 182. Mickley's, Pa.: Published by the Author.

VOL. IX.

NEW YORK, MAY, 1894.

No. 5

THE PROGRESS OF THE WORLD.

*The Ship Canal,—
A Supreme
Opportunity.*

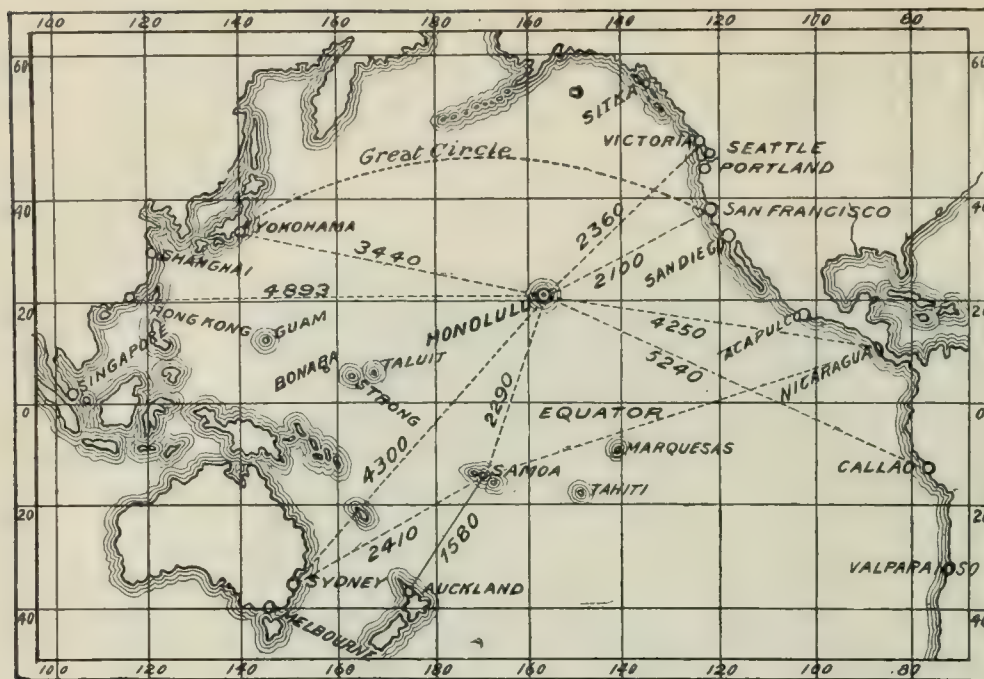

Questions concerning navies, coaling stations, foreign trade and dominant influence at points of strategic value

in the great game of international commerce, have been more than ever prominent in the past few weeks. It is evident to those Americans who are in a position to know how Europeans regard our country, that England, Germany, France and Russia are at present watching us with a somewhat puzzled and bewildered but also a very alert and fixed attention, to find out what it is that we shall conclude to do with our immediate opportunities. They are bewildered because they can scarcely bring themselves to believe the evidence of their own eyes, as they see how hesitant we are to avail ourselves of what lies within easy grasp. They all understand, for example, how vast is destined to be the expansion of commerce in the Pacific ocean within the next few years, and they are also aware that the two great keys to the control of that commerce will be the interoceanic passage and the Hawaiian islands. France has made an almost superhuman effort to construct and dominate the interoceanic route, and has failed. The United States now possesses an easy, safe and undisputed opportunity, at a cost that is small compared with the recompense that will quickly follow, to construct and forever to control the interoceanic passage by virtue of the Nicaraguan concession. Yet it still remains doubtful whether the Congress at Washington will have enough statesmanship and a sufficient sense of the national dignity and the national destiny to settle aright this simple question. We do not know what complications in the future might render the situation difficult, or even rob us altogether of our great opportunity. What we do know is that we have abundant resources for the work, and that every instinct of patriotism and every dictate of statesmanship demand prompt action by Congress. There can be little further doubt as to the willingness of President Cleveland to sanction and in every way within his lawful power to expedite an American ship canal. This passage would constitute in effect a portion of our coast line, and its largest patronage would probably arise out of the coastwise traffic between our own Atlantic and Pacific ports. But it would also make directly accessible to our Atlantic and Gulf trade the entire west coast of South America. For traffic with Japan, China, India and Australia, it

would, as a matter of course, be open on equal terms to European and American merchantmen.

*Our Position
in the
Pacific Ocean*

Even more puzzling to European observers than our languid indifference as to the great chance that is ours to benefit our own country and at the same time to promote the world's prosperity and civilization by taking in hand the interoceanic ship passage, has been our policy, or rather our contradictions and paradoxes of policy, regarding the "Paradise of the Pacific." No European statesman would for a moment make himself so ridiculous in the eyes of all his compeers as to deny the proposition that annexation to the United States would prove an incalculable blessing to all the people and all the interests of Hawaii, and at the same time an advantage of the most positive character to the United States. The suggestion that there could be any hopeless difficulty in reconciling the annexation of Hawaii with our American political system and structure, would to foreign statesmen be tantamount to a confession of intellectual feebleness akin to total imbecility. The United States will sacrifice much of its claim to the respect of the world if it stupidly and ingloriously abdicates its clear opportunity to acquire a leading and beneficent influence in the Pacific ocean. It was through the United States that Japan and China, with their ancient civilizations and their vast resources, were brought into communication with occidental nations; and with respect to the magnificent possibilities that lie before these reborn nations of the Orient, the United States has a duty as well as an opportunity that ought to quicken and inspire our people like the call of a trumpet. It is our duty, if ever the prestige and power of one nation gave it a duty toward a weaker neighbor, to help Japan throw off the shackles of the cruel and humiliating commercial treaties through which Europe shamefully oppresses her. With China it should be our policy to maintain relations of the most honorable and friendly character. Russia has been our traditional friend; and the great operations she is conducting upon her Siberian coast will make her eventually an important factor in the politics and commerce of the Pacific ocean. Korea has been introduced to the family nations chiefly through our neighborly offices. With the control of the Hawaii group for naval and political purposes, the United States would assume in the

HAWAII AS A CENTRE OF PACIFIC TRADE.

Pacific ocean the position that its dignity requires and that consistency with its past course no less plainly necessitates. The whole world would immediately and willingly acquiesce in this step, and would welcome the Stars and Stripes as the emblem of peace and good will toward all mankind in the north Pacific.

Bermuda as an Object Lesson. In order to show how attractive and promising in themselves, apart from their strategic importance, the Hawaiian islands really are, we present to our readers in this number a brief sketch of their natural conditions and resources and of their life and society by an American lady who has enjoyed a long residence there. As a companion picture we also publish some notes upon Bermuda, which occupies a position in the Atlantic in some respects strikingly analogous to that which Hawaii holds in the Pacific. It also is of coral formation, and it has a like charm of semi-tropical life and products. But Bermuda is a diminutive spot as compared with Hawaii, and although it is one of the greatest of the naval strongholds of England, its strategic importance is far less than that of the group lying at "the cross-roads of the Pacific." Yet admitting that the Bermuda group is comparatively unimportant, it ought not to be difficult to prove that it should have been acquired in the revolutionary days by the United States. Its trade is almost exclusively with New York, its telegraphic connection is with our mainland, and everything in the natural situation makes it tributary to us. Furthermore, it would be unwise for us to forget that during our civil struggle Bermuda was made a base of operations against the United States, and was the constant refuge of "blockade runners." Arms and other munitions of war purchased in Europe were stored and held in Bermuda, for delivery upon the Carolina

coast a few hundred miles away, as opportunity seemed to offer. The constant use of Bermuda for purposes aggressively hostile to the United States, under circumstances pointing either to official connivance or culpable laxity, would seem to have justified us at the close of the war in demanding from Great Britain the cession of this strong fortress lying off our coast. It is not for the purpose of reopening an unpleasant chapter in the relations between Great Britain and the United States that this allusion is made, but wholly by way of illustration. Our Southern statesmen ought to be even quicker to apply the lesson than those of the North, for they can well remember how seriously serviceable in their cause

against the government at Washington was the fact that Washington did not control the islands in the Atlantic that occupy places of strategic importance with reference to our coast line. Our civil war was so costly for both sections concerned in it that there ought to be a unanimous desire to profit at all points by its bitterly earned experiences. The civil war taught us that our forefathers had made a mistake in neglecting to acquire Bermuda at a time when, in point of fact, the thing would have been quite possible. We can readily forgive those forefathers; but our posterity may not deal so gently with the memory of the statesmen of the present day if, in the light of past experience, they shall fail to improve our opportunity to bring the Hawaiian group under our flag.

Fortifying Pearl Harbor at the Eleventh Hour.

There is some reason to think that President Cleveland and his advisers have begun to appreciate the importance of maintaining and strengthening the position that already belongs to us in Hawaii. Admiral Walker has been placed in command of our naval

forces in the harbor of Honolulu, and it is understood that his orders authorize him to begin at the eleventh hour to utilize the concession, which we hold under our treaty with Hawaii, of the exclusive right to establish a naval repair and coaling station in Pearl Harbor. The treaty expires next year. By all fair interpretations of that treaty it would seem that the concession also terminates at the same time unless renewed by mutual agreement. To begin at this time the engineering operations necessary to carry into practical effect the privilege ceded to us by the late King Kalakaua, would indicate a purpose on the part of Mr. Cleveland's administration to maintain such future close relations with the Hawaiian government as would make it agreeable for Hawaii to renew the Pearl Harbor grant for a long period or in perpetuity. If Mr. Cleveland and Mr. Gresham shall pursue such a policy, they may be certain of the well-nigh unanimous approval of the people of the United States. They may be further certain that many of their fellow citizens who have most strenuously opposed their last year's programme of interference with the provisional government and of restoration of a collapsed monarchy, will be quite ready to forget bygones and to support them in a policy looking hopefully toward the future rather than carpingly toward the past.

*The Question
of Trans-
Pacific Cables.*

The question of Pacific ocean cable lines is one which our government and our people should just now consider with something of the keen interest that it commands in Australia, Honolulu, Canada, and Great Britain. For, in fact, we have more at stake than any other of the interested parties. Already, as our readers have been informed more than once, the first section of a Pacific cable has been constructed, comprising the line that extends from Brisbane on the Australian coast to New Caledonia. The accompanying map will be of service to those seeking enlightenment regarding proposed cable routes. The next section of the proposed trans-Pacific telegraph will stretch to Samoa, probably by way of the New Hebrides and the Fiji group. Thence it is proposed to proceed towards Hawaii, with a station at Fanning island, of the America group. The Canadians are determined that the American terminus of the system shall be at Vancouver, thus making a continuous line by way of Halifax and the Canadian Pacific railway from Great Britain to Australia. The Canadian governmental authorities, together with the officials of the Canadian Pacific railway and its new Pacific ocean steamship line, are exerting themselves with great enterprise to make sure of a terminus upon British soil. The shorter and more natural route, as well as the one most advantageous to commerce, would be from Hawaii to the California coast at Monterey, near San Francisco. This route from Brisbane, it should be observed, leaves Japan and China quite out of the question, and would compel either the laying of a direct cable from Honolulu to Yokohama or else a roundabout communication with those countries by

way of Australia. British interests would be best served, obviously enough, by a line meandering from Canada to Australia by way of various Pacific island groups, most of which are under British domination. The interests of America, Japan, China, and perhaps also of India, would be somewhat better served by a

PROPOSED CABLE ROUTES.

line from California to Honolulu and thence directly to Yokohama. There are strong arguments in favor of the construction of both lines westward from Honolulu, and there is urgent reason why California should be immediately connected by cable with Hawaii. If the British Empire should choose for its own purposes to lay a cable from Honolulu to Vancouver there could certainly be no objection, although from the commercial point of view such a project would seem to be rather unnatural and superfluous.

*Shall We
"Scuttle"
Out of Samoa?*

Our present Administration at Washington has given evidence in several marked ways of its disapproval of the treaty made in the early part of Mr. Harrison's term of office by which the United States entered into an arrangement with England and Germany for the joint protection of the Samoan group. Unfortunately the joint protectorate has not yet secured domestic tranquillity for the Samoan people. From the point of view of the tribal chiefs of Samoa, the protecting powers are sustaining in authority the wrong native ruler. There has been a succession of insurrections and, especially of late, some most disagreeably barbarous outbursts of civil strife. The authority of the protecting governments is at present sustained in Samoa by a Vermont man, Mr. Ide, who holds the position of Chief Justice. He has had a difficult task, and has apparently performed his duties with justice and discretion, although certain aggravated reports charging harshness in his treatment of native chiefs have been disseminated. The conclusion that the tripartite arrangement is a total failure and that the

United States should now withdraw from it and leave both Samoa and American interests in Samoa to their fate, would be more precipitate than just or reasonable. It is not easy to see why in the nature of the case the Samoan treaty should not eventually secure for these charming islands an orderly and prosperous state of affairs, without subjecting the United States either to any serious annoyance or to any burdensome expense. In the case of Samoa a waiting policy would seem to be more desirable for us than the policy of hasty retreat that the English call "scuttling."

*What England
Has Done
for Fiji.*

We were so accustomed, some years ago, to the idea of the Fiji group as a habitat of horrible cannibals and as a region hopelessly remote from all interests American or European, except as a field for missionary zeal and heroism, that it is difficult without effort to realize the present position of Fiji as a respectable and intelligent community, participating with some degree of enterprise in the affairs of the great world. Yet the colonial government of Fiji is participating most worthily and busily in the discussion of the proposed Pacific cable, and has agreed to pay out of its ample revenues a handsome subsidy for telegraphic communication with those portions of the earth's surface which are principally land rather than water. The Fiji group, consisting of some 200 islands, has a total area of perhaps 5,000 square miles,—more than twice that of the State of Delaware, or about equal to that of Connecticut. The native chiefs ceded their islands to Great Britain twenty years ago. The English have maintained in that group a firm but a wholly just and beneficent rule. The natives, who number somewhat more than 100,000, are almost to a family ardent members and supporters of the Wesleyan Methodist church, and live in happiness and peace under the local rule of their native chiefs, who in turn come under the supervision of a central executive and legislative council of English officials and an English system of judiciary. The commerce of the islands has grown rapidly, and they furnish a very appreciable quota of the world's supply of several important tropical products.

*Shall We
Do Our Part,
or Shirk?*

Far from feeling jealous or unfriendly towards England for taking these islands under her protection, we as Americans owe it to our own good judgment and right feeling to praise heartily the results of this British occupation, as a creditable part of the real progress of the world in the past two decades. It is true that the English have managed to make the increased prosperity and well-being of the Fijians contribute handsomely towards the growth of British commerce. But there has been nothing but fair play in the entire process. German or French colonial administration appears in a very unfavorable light when contrasted with that of England. For us to abandon Samoa at present would in all likelihood result in the withdrawal of Great Britain also, and in the establishment of a sole German pro-

tectorate. And this, in the judgment of discerning minds, would be a severe misfortune for the Samoan group and at the same time an infelicitous thing for the future interests in general of the western Pacific island communities. Instead of our withdrawal from Samoa, would it not be far wiser, more humane, and better in accord with the exercise of our fair share of responsibility for the world's good order and progress, if we should hold our ground in Samoa, agreeing with our English partners to do what we can to promote in the Pacific islands, all the way from Hawaii to Australia, a harmonious, simultaneous development of civilization on the basis of the English language and of Anglo-American principles of liberty and justice?

*Hawaii's
Constitution-
Making.*

The making of a constitution for Hawaii is engrossing the attention of the best minds in that commonwealth. Fortunately there is no lack of ability and experience. President Dole has served Hawaii as Chief Justice, and is highly competent as a constitutional lawyer, while possessing the qualities of a constructive statesman. Mr. Thurston and other leading men of the islands are also equal to the delicate task.* The election of delegates to a constitutional convention will take place this month. This election will be open to citizens of American, European, and native Hawaiian origin,—but not to the Chinese or Japanese, for the sound and sufficient reason that these large contingents of the population are as yet a floating labor element rather than part and parcel of the community, and for the further reason that Hawaii is an English-speaking commonwealth in whose affairs it would be wholly wanton and mischievous to introduce great extraneous Asiatic elements that have never participated in any way in political or representative institutions, and that would fail to understand the questions at issue. The constitution to be adopted can easily provide safe and fair qualifications, compliance with which will admit to full political privilege any man of whatever race or nationality. The peculiar circumstances of Hawaii would obviously make a good knowledge of the English language an almost indispensable requisite. It is much to be hoped that the new Hawaiian constitution may be drafted, adopted, and put into operation with the least possible delay. The accession of a new and fully matured government in place of the provisional arrangement now existing, may lead President Cleveland to entertain with favor the idea of a reopening of negotiations for a treaty of annexation. So far as we are aware there is nothing in his policy or his utterances hitherto that would preclude such a course.

*The Patrol
of the
Behring Sea.*

It is gratifying to note the fact that the governments of the United States and Great Britain have both proceeded in perfect good faith to provide by legislation, and by the dispatch of a requisite naval armament, for the enforcement of the rules for a "close season" in the Behring Sea and the North Pacific Ocean that were

laid down by the recent tribunal of arbitration in the matter of fur-seal fisheries. There was for a time some degree of apprehension in this country lest the British government should not use what would seem to us a proper degree of energy for the effective restraint of the poaching vessels which rendezvous at Vancouver. But so far as we can learn neither country has any cause for questioning the perfect good faith of the other in all that pertains to an honorable regard for the findings and recommendations of the Paris tribunal. Whether the seal question *per se* has or has not been wisely and permanently adjusted, is a question that nothing but experience can answer. Yet even if the proposed arrangements should not fail to prevent the extermination of this interesting and valuable species of animal, a far more important result will have been attained,—namely, the peaceful and amicable adjustment of an international difference which might have grown into a bitter and scandalous dispute, and even under certain contingencies might have led to the clash of arms and the shedding of blood.

*As to
Naval
Matters.*

There have been so many demands of late upon our rehabilitated navy that the desirability of the continued addition of

new ships is becoming apparent even to those who have felt very little enthusiasm over the reappearance on the ocean of the United States as a naval power. While the English government under the pressure of public opinion has just now entered upon the policy of an enormously accelerated construction of new ships and the Chancellor of the Exchequer has been inventing new modes of taxation in order to pay the enhanced bills, our own House of Representatives has first passed a revenue bill which admittedly creates a deficit, and then on the plea of poverty and necessary retrenchment has refused to authorize in the Naval Appropriation bill the one new ship which it has been our accepted policy to order at each annual session. With all the respect to our law makers that may be their due, we must assert the opinion that they have mistaken the national will as to the regular increase of the navy. The United States has legitimate use for a considerably greater number of public vessels than are now in commission or under construction, and the country can better afford to build them than to be without them. The month has witnessed some noteworthy changes in the personnel of our principal naval officers. Admiral Benham, whose opportunities for conspicuous service have of late added much to his well-deserved popularity, has reached the age limit and has gone upon the retired list. Admiral Irwin has also served to the full limit, and turned over his responsibilities to his successor. Both of these gallant public servants had the honor to be in very conspicuous command of squadrons performing important service in foreign waters at the moment of their retirement; and both took homeward passage as private gentlemen on commercial ships. They had served in the navy for periods extending back many years prior to the outbreak of the war in 1861, and

they merit the grateful esteem of their fellow-citizens.

*Chaos
in the
Lower House.*

Affairs at Washington have not moved in recent weeks with any of that definiteness and precision which the country had a right to expect from a great party to which it had intrusted all the branches of the government. It might be said that nothing has been regular or calculable except a daily recurrence of chaos. Conservative business men breathed a sigh of relief when President Cleveland vetoed the so-called Seigniorage bill, returning it to Congress with a message of considerable length and of characteristic manner. But enormous pressure had been brought to bear by the leaders of the majority of Mr. Cleveland's own party in both Houses of Congress to induce him to allow this measure to become a law; and the veto message was received with extreme bitterness and with the result of a quickly perceptible widening of the breach between the Administration and the preponderant element of the Democratic majority in the two Houses. Far from giving up the contest in view of the repeal of the Silver Purchase act and the veto of the Seigniorage bill, the pro-silver leaders were rendered the more determined and aggressive by their last repulse. Notice was promptly served that this session should not end without a trial of strength on the direct and radical issue of the unqualified and unrestricted free coinage of silver as a full legal tender. Meanwhile the House of Representatives has been chiefly occupied with an unprecedented struggle over the question of its own organization. With an enormous party majority, the Democrats been unable to command a working quorum. They had refused to avail themselves of Mr. Reed's mode of escape from the same difficulty four years ago. Their unwillingness to count for purposes of quorum those members present in the hall who might choose to obstruct business by refusing to respond to the roll call, made it necessary for them to rely upon the attendance of a working quorum of Democratic members. But Democratic discipline has been so ineffectual that, with all their efforts, Speaker Crisp and his chief lieutenants have been unable to keep at Washington and in attendance upon their duties more than from two-thirds to three-fourths of the Democratic members at any given moment. They have at length acknowledged themselves baffled and have decided in Democratic caucus to adopt Mr. Reed's principle, and to count for purposes of a constitutional quorum all members present in the Hall of Representatives at the time of the beginning of a roll call. Mr. Reed's rule put the counting in the hands of the Speaker himself, who practically exercised the authority through the clerks at the desk. The Democrats have preferred to adopt the plan of having the Speaker appoint two members as tellers at the beginning of a roll call, who will be charged with the performance of this duty. The principle is the important thing, and the variation of details is of no consequence to the public. It is a disgrace that the time of the House should be wasted by absenteeism

and by filibustering against a quorum, and it is a distinct gain for efficient parliamentary work at Washington that the Democrats have at length acquiesced in so necessary a proposition as the reckoning for purposes of a quorum of all the members who are actually in the Hall and participating in legislative affairs.

*Speaker Crisp
Stands
Fast.*

It was at a time when the turbulence of the House was at its greatest height, and when the problem of managing the Democratic majority seemed most hopeless, that a great and tempting personal opportunity presented

CHARLES F. CRISP.

itself to Speaker Crisp. Death made vacant the seat of a Georgia Senator; and Governor Northen, with the cordial acquiescence of the entire State, appointed Speaker Crisp to fill the vacancy. Acceptance would unquestionably have been followed by future legislative indorsement, and Mr. Crisp would have found himself in possession of a virtual life hold upon a seat in the most distinguished and authoritative law-making assemblage in the world. Mr. Crisp's friends have long known that his highest ambition was to attain the position of United States Senator from his native State. The temptation was a powerful one; but if Speaker Crisp hesitated at all, it was only for a moment. His colleagues in the House congratulated him with enthusiasm, but begged him to remain at his arduous post on the ground that the Democratic party, and the state of the public business, required his further services at the Speaker's desk. Mr. Crisp accepted this verdict, declined the proffered honor in a manly letter, stuck to his rather thankless and terribly harassing task of presiding over a bear-

garden, and won golden opinions from all parties and from every section of the country. Mr. Crisp's difficulties are rendered the greater rather than the less by the fact of his party's immense preponderance in the House. The whole country should rise high enough above party spirit to recognize his eminent ability, good temper and essential fairness in a position of governmental authority second only to that of President Cleveland himself.

*The Tariff and
Income Tax
in the Senate.*

The Senate has been listening to a series of set speeches upon the composite revenue measure that carries Mr. Wilson's name and which had been reported from the Senate Finance Committee's room with several important amendments, chief of which was the fixing of a duty upon sugar. The discussion only served to put in stronger light the fact that the measure as it stood was satisfactory to no one. Its advocacy was tame and apologetic, while its opponents were armed with an array of facts and arguments against it which were scarcely met by those who had concluded on party grounds to support it. The Republican Senators, as was to be expected, made impressive speeches; but more attention was attracted by the efforts of the few Democratic Senators who had refused to acquiesce in the bill as a party measure. Senator Hill, of New York, made a noteworthy speech directed chiefly against the income tax feature of the bill, and Senator Smith, of New Jersey, who is a recent acquisition to the body, made his first conspicuous appearance in an argument against the in-

SENATOR SMITH, OF NEW JERSEY.

come tax that was considered quite as able and convincing as Mr. Hill's. Yet during the whole debate the Democratic majority felt assured that a sufficient

number of Democrats had committed themselves to the support of the measure to insure its passage ; and the weakness in debate of the ruling faction did not seem to affect their confidence as to results.

*The Income Tax
as a
Sectional Issue.*

In the country at large the support of the proposed income tax is far stronger than its New York and Eastern opponents are aware. Their eyes were somewhat opened, however, by the report of a test vote in Louisiana. At a primary election held in the Fourth or Shreveport district by the Democratic party to nominate a successor to Mr. Blanchard,—who has been transferred to the Senate to take the place of Mr. White, now elevated to the Supreme Bench,—several leading questions of the day were submitted to the voters as a means of ascertaining their real sentiments. Several thousand votes were polled, and the advocates of the impending income tax were about forty times as numerous as its opponents. In most districts of the West and South the proposition to tax for the national benefit all incomes in excess of four thousand dollars would probably be indorsed by rousing majorities if it were submitted to a vote. Yet such a step was not in contemplation by either of the great parties when last they made platforms, nor did it have any part in the campaign for the election of the present Congress. The Democrats were returned to power upon the square issue of a protective *versus* a revenue tariff. They were pledged to eliminate protection and to give us a tariff capable of producing ample revenue, arranged with sole reference to that object. The Wilson bill does not provide such a tariff, but retains every feature and principle of protection and discrimination that led the Democracy at Chicago to pronounce the Republican tariff system as unconstitutional and a fraud. But the Wilson measure goes still further than the Republicans have ventured in the direction of discriminating class legislation, and interjects into our national system a sharp line between those whose incomes lie above and below the mark of four thousand dollars. The West and South view the proposition with favor partly because large incomes are more frequently found in the older and richer communities of the East than in the less mature portions of the country at large. For it is felt that the great agricultural States have suffered unduly from an Eastern monetary policy that has depressed the price of staple products. There is nothing gained by the violent tone of the Eastern press, which calls the pending income tax a dishonest and rascally scheme on the part of a “wildcat” South and a “bankrupt” and “boom-collapsed” West to victimize the honest and frugal millionaires of New York, Philadelphia and Boston. In England, the Liberal party has just reported a budget increasing the income tax rate for the present year ; and this move is confidently expected to win favor among the working men, while those having large incomes, who are already for the most part allied with the Conservatives, will prate in vain about socialism and dema-

gogy. An income tax is not a dishonest or rascally mode of procuring public revenue in England or Prussia, and there can be no gain for the argument against it in this country by applying such adjectives. There are a great many persons in the West and in the South,—although Eastern newspapers seem unaware of the fact,—who enjoy incomes exceeding four thousand dollars. It is unworthy, unjust and absurd to denounce the project as one primarily and spitefully intended by those great sections to throw undue burdens upon New England and the East. The Atlantic seaboard north of Maryland possesses no monopoly of private honesty or political virtue. An income tax is a perfectly legitimate proposition ; and if the question of sectional advantage or disadvantage is to be considered, it may at least be retorted that the Eastern rallying cry of “free raw materials” involves an infinitely more disastrous attack upon the prosperity of the West and South.

*Objections
to the Tax.*

But while we shall insist upon recognizing the perfect good faith of the Western and Southern people who favor the income tax, and whose seem destined beyond much question to succeed in making the project a law, we are none the less opposed to it on many grounds. A sufficient ground ought to be the lack of any necessity for the revenue it will produce. The tariff and internal revenue taxes as adjusted by the Senate committee would provide a sufficient national revenue, without the addition of a tax on incomes. Another and a graver objection grows out of the very nature of our federal system. It has not been our policy in matters of taxation to bring the federal officer into personal contact with the private citizen, except as the citizen passes his imported wares through the government's custom houses. It is true that the whisky and tobacco taxes form a limited exception to this rule, but the system has become well established and the government has only to deal at the point of manufacture with a few easily regulated industries. Yet the experience of federal attempts to enforce the internal revenue laws has led many statesmen and thoughtful citizens to deny totally the expediency of any attempt on the part of the general government to procure revenue under any such methods. The income tax is totally opposed to the spirit of our federal system, and is an encroachment upon the domain commonly regarded as wisely belonging to the individual States. The whole machinery which the assessment and collection of the income tax will require, must surely prove itself to be complicated, inquisitorial and offensive in practical operation, to a degree well-nigh intolerable. As the law stands, the tax will operate in anomalous ways ; its curious inequalities in practice will tend to create the sentiment among its victims that it is a form of persecution and blackmail rather than of taxation, and that it is to be evaded if possible. Whatever its theoretical merits may be, we do not think that it could at the present time in this country be put into successful operation.

*Its Exemption
Line Is
Un-American.*

But most serious of all the reasons why we oppose the income tax is that it seems to us, as it stands, to be unmanly and un-American. It tends to create class distinctions in a land which has heretofore stood for equality and simple manhood. The English income tax, it is true, is a discriminating one; for it exempts incomes below £150. But England is a land of class distinctions which are sharp and real. It is almost impossible for a man in England to make his way across the chasm that separates the working classes from the middle classes. To the average American, these distinctions of caste, drawn so boldly in English life and society, are not only things that lie beyond the range of his experience, but are not even mentally comprehensible. The rail-splitter or tow-path boy who lands in the White House is no rare type with us. Nearly all of our successful men in every walk of life are so intimately allied by personal experience, or by birth and family connection, with those who toil with their hands and gain their bread in the sweat of their brow, that the pretense of superior class rank would make them a public laughing stock. The tradition of self-respecting American citizenship makes one man as good as another. If there is to be an income tax in this country it should be levied in such a way as not to create a class. If ours is to be a government supported by the rich, why should we not also adopt the obsolescent German system which gives the heavy taxpayers a large preponderance of influence at the polls? It seems to us that there can be very few independent farmers and self-respecting men of thrift and character in the United States who, if the odious principle of this bill were made clear to them, would not prefer to have the four-thousand-dollar exemption feature abolished. The English income tax seeks to exempt only the great army of laborers and artisans who cannot hope to attain a family income greater than fifteen dollars a week. In America there is much less reason for exempting even these classes; for here there is such an equality of opportunity that exemptions and discriminating rates have no needful place in a scheme of taxation. The workingman who owns his home feels the truer sense of manhood and dignity when he pays his yearly tax upon its assessed valuation. All that he desires is to be assured that his rich neighbor is likewise taxed at the same rate upon the same scale of assessment. And so, as regards an income tax, we believe that the sturdy manhood of America will sooner or later repudiate the false and degrading discrimination which fixes a line of exemption at \$4,000. The professional man with an income of \$3,000 in any one of ten thousand prosperous American communities, is a far richer man than his brother in New York or Chicago whose income is \$5,000. He lives in a larger and better house, may keep horses and a carriage, and may enjoy numerous luxuries that are wholly out of the reach of his New York brother. It is not only un-American and unfair, but it is ludicrous and absurd that the New York man should be taxed on his income for the support of the national government, on

the score of his superior wealth, while the other man should be exempt. Unless conditions materially change, any form of national income tax would be an excrescence and a complete mistake. But if we must make experiment of this objectionable kind of impost, there ought at least to be no exemption, unless at some point not above \$1,000 nor below \$500.

*New York's
Reform
Movement.*

The Republican Legislature of New York turned out rather disappointingly from the point of view of the reformers who had expected it to show a fine zeal in undoing Tammany Hall and in enacting measures to promote the better government of New York City. For many weeks it was charged that a "deal" between Tammany Hall and certain Republican leaders had been effected, with a view to the future division of spoils; and that the Legislature would not be permitted to interfere too seriously with Tammany's prerogatives. In the last days, however, the law-makers rallied under the pressure of a strong public opinion and several important measures were placed on the statute book. A new police system for New York City was adopted, and provision was made for a thorough and leisurely legislative investigation into Tammany's misgovernment of various city departments. Several other bills advantageous to the metropolis were rapidly carried through the two chambers and sent to the Governor before the date of adjournment. It should be understood, however, that all these measures are merely transient and palliative in their nature. The affairs of New York City can never be properly dealt with at Albany, whether by a Democratic or a Republican Legislature. Even if the Legislature were composed of citizens of the highest capacity and municipal reformers of the most expert qualifications, there would still be only impropriety and futility in the plan of relegating the concerns of the metropolis to the New York State Assembly and Senate at Albany. What New York needs is the framework of a unified, modern city government, and then a complete abandonment to its own self-ordained fate. The Constitutional Convention, which is about to assemble, affords the supreme opportunity. This convention should provide for a uniform plan of organization and government for all the important cities of the State excepting the metropolis, and should deal separately with the Greater New York,—providing for consolidation and establishing a metropolitan government to be exercised fully and completely by one large central council or municipal parliament, whose members should be elected on a general ticket under a system of proportional representation. This opportunity to launch New York upon a great municipal career if neglected in 1894 may not recur for a long time. The general course that we have here indicated would set New York in the forefront of the great urban centres of the world, and would unquestionably result in the establishment of a magnificent system of municipal administration participated in by some of the most distinguished citizens. The plan is no fad or theory, but a sound and practi-

cal one based upon the experience during the last quarter century of most of the principal cities of the world.

*Prohibition
Abandoned
in Iowa.*

After more than a decade under full legal prohibition of the liquor traffic, the State of Iowa has receded from that high posi-

tion. The arrangements now adopted by the Legislature and approved by the Governor provide one method for licensing saloons in towns having five thousand or more inhabitants, and another method for towns having less than five thousand. In the larger communities the consent of the City Council alone is requisite. The license fee is fixed at \$600 a year, payable in quarterly installments. In the smaller communities, saloons cannot be licensed unless 65 per cent. of the voters give their written consent. The license fees are divided between the county and the municipality. Such are the main facts regarding the new system, so far as we have been able to learn from the newspaper accounts that have reached us. As regards communities of five thousand persons or less the plan seems to be designed to maintain prohibition. Only a small fraction of the people of Iowa belong to towns and cities having a population greater than five thousand. But we must confess that the terms upon which saloons may be lawfully conducted in the larger towns and cities seem to us surprisingly lax considering the great reluctance with which the people of Iowa have consented to the abandonment of prohibition. As matters stand, the saloon business is put upon a more inviting basis in the chief towns of Iowa than in those of Minnesota and Nebraska, and also, if we mistake not, in some of those of Missouri,—although these three States which adjoin Iowa on the North, West and South have never made any pretense of a purpose to extirpate the liquor traffic. The payment of a liquor license in quarterly installments, rather than in a lump annual sum in advance, is a very great concession to the least responsible and most objectionable class of saloon keepers. Moreover, the neighboring States have found it entirely feasible to maintain a fee of \$1,000. Perhaps the real secret of the precise form in which the new Iowa system is molded is to be found in the fact that the new statute is simply designed to give legality to a condition that has existed in nearly all the principal towns in scandalous defiance of the law and the authority of the State. Inasmuch as the cities of Iowa have long been regularly licensing saloons in disregard of the prohibitory statute, it may have been felt that if the license fee had been fixed at \$1,000 the municipalities would pay as little regard to the terms of the license statute as they had paid to the prohibitory enactment.

*South Carolina
and Iowa.*

The retrogression of Iowa, from the point of view of the prohibitionists, was nearly simultaneous with a tremendous struggle on the part of Governor Tillman, of South Carolina, to enforce his system of state liquor dis-

pensaries. It is difficult to judge of the wisdom or unwisdom of Governor Tillman's course from a distance of some hundreds of miles. Opinions may well differ. But at least there can be no harm in admir-

GOVERNOR TILLMAN, OF SOUTH CAROLINA.

ing the Governor's pluck and high spirit, and his determination that a law which is on the statute book shall be obeyed. His fight,—which involved the calling out of troops and imminent danger of bloodshed,—was simply for submission and obedience to an un repealed law of the sovereign State of South Carolina. One may well ask whether, at some time in the past dozen years, the State of Iowa out of regard for its own future ought not to have faced resolutely the alternative, and either enforced its prohibitory law with a high and relentless hand, or else swept it scornfully off the statute books. The experience of South Carolina and the experience of Iowa alike may well teach us that laws of a certain radical type, affecting men's habits and customs, require for their successful operation a preponderance of sentiment that is at once very strong and very evenly distributed throughout the region over which the law has jurisdiction. On April 20 came the report that the South Carolina law was adjudged unconstitutional by the State's highest court. But the *personnel* of the bench is expected to change in the early future, with a chance of a reversed decision. The end is not yet reached.

*Europe's
Costly
Armaments.*

The European nations are beginning to droop and totter beneath the ever accumulating burden of military expenditure. There is hardly a country among them that is not at the present moment struggling desperately to choke the deficit which is staring it in the face. In England, Sir William Harcourt was five million pounds (\$25,000,000) short, which must be provided for by new taxation. The Indian Empire is proposing to tax all imports except cotton five per cent. *ad valorem*, to meet its deficit, besides adopting other expedients unpopular but necessary. In France, there is a deficit of nearly \$30,000,000, about half of which it is proposed to cover by a refunding of loans at a lower rate of interest, and the remaining half is to be obtained by increased taxation on incomes and spirits, with taxes on succession duties. In Italy, the new finance minister frankly admits the existence of a deficit of about \$50,000,000, to be met no one knows how. The country cannot bear increased taxation, and the chances of any minister who ventured to propose serious retrenchment and the disbanding of surplus employees would be practically worthless. Everywhere the statesmen are seeking with feverish anxiety for new sources of revenue, but everywhere the insatiable maw of armaments demands more and ever more millions.

*Can Military
Expenditure
be Reduced?*

With all Europe in this extreme state it is not surprising that out of the very depths of their desperation people should have begun to hope. Once more we hear rumors of projects of disarmament; or, to speak more correctly, of reduction of military expenditure. These rumors took a more definite shape in a remarkable telegram of M. de Blowitz in the London *Times* of March 26. The form in which this relief is to be expected, we are told, will not be that of any simultaneous partial disarmament, but the reduction of the time of military service to a single year. This, no doubt, would afford enormous relief, and if adopted by all the powers would leave the *status quo* unchanged. According to King Christian IX of Denmark, his son-in-law the Czar and the Emperor of Austria are ready and eager to take action in this direction. The Danish King's words which he is said to have addressed to a Spanish statesman are so significant that we quote them here:

I hope to live long enough to see Europe enter upon the pathway of military retrenchment, and to behold the sovereigns of Europe taking measures to protect their several peoples against the constantly-increasing burdens of military armaments. My dear son-in-law, the Czar of Russia, whose mission consists in maintaining peace, is quite ready to enter upon this pathway, and my great and good friend, the Emperor of Austria, is equally disposed to do his utmost to this end.

King Christian went on to say that the rulers of Spain and Italy were equally eager to see all the peoples relieved of a portion of the burden which lay upon them.

*The
Kaiser's
Dream.*

But what of the two great combatants who after a truce of twenty-three years still stand confronting each other armed to the teeth, apparently waiting for a signal to begin a war to the death? On this point the Danish King said that he had not ventured to speak to the German Emperor on the subject, because a young sovereign is always dreaming of winning new laurels—a very significant remark, which, however, does not seem to be well founded. M. Capelli states that the German Emperor would be glad to see Italy reduce her army. Chancellor Caprivi made a speech at Dantzic in which he hinted indirectly and mysteriously at a design of the German Emperor which the *Germania*, reading between the lines, declares to be the reduction of the burden of military expenditure. Chancellor Caprivi, after congratulating his hearers on the conclusion of the Russo-German treaty of Commerce, said that the Emperor regarded it not only as a condition of commercial progress, and a guarantee for peace, but as something much more important. He saw further, and had an eye to the probability that in the forthcoming century the peoples of Europe might find it necessary to stand shoulder to shoulder, and that some of them might not be powerful enough to face coming eventualities alone. This is interpreted as meaning that the Kaiser is working for the formation of a United States of Europe, which is certainly a problem that could not be solved by any nation alone. Europe will not be federated to-day, to-morrow, or the next day; but it is a sign of progress when the dreams of the idealists have materialized sufficiently to pre-occupy the attention of sovereigns and statesmen. Whenever any practical step is proposed in the direction of the reduction of armaments or of the federation of Europe, it is to be feared that France will block the way.

*What is
Owed to the
Czar.*

It is satisfactory to find the opinion prevailing on every side that the Czar, the peace-keeper of Europe, can be depended upon to use every jot of his immense influence, whether created by his independent position or by his friendly relations with France, to restrain that prospective peace-breaker of the world within bounds. The alarm which prevailed in some quarters on account of the recent interchange of Russian civilities with France has been removed by the conclusion of the treaty with Germany, which is to be followed, according to recent reports, by a visit of the Russian Emperor to thank the Kaiser for the part which he took in this work of peace. Lord Dufferin, speaking at the banquet of the British Chamber of Commerce in Paris, after speaking of the extreme magnanimity and high sense of honor displayed by the Czar, said:

I observe that many publicists are of opinion that it is upon the fiat of the Emperor of Russia that the contingency of peace or war mainly depends. If this is the case, I think that Europe is in safe hands, for every day is producing fresh evidence of his Imperial Majesty's wisdom, moderation and peaceful intentions. That he possesses these admirable qualities I have long known.

No doubt it was well known to Lord Dufferin and to others who knew Alexander III; but what a comment it is upon the dangerous ignorance of mankind that such an elementary fact of such supreme importance as that of the real character of the Czar was not merely unknown but absolutely falsified by the press of Europe for six or seven years after his accession to the throne. If to-day the best informed statesmen of Europe were to decide by free vote whom they would prefer to elect as supreme arbiter of peace and war, they would probably vote almost unanimously in favor of investing the Czar with the magistral position which he actually occupies.

The Increase in the British Fleet. The Czar is no sentimentalist, and he will naturally not risk bringing about a conflagration by proposing any millennial schemes of disarmament; but that he is giving his closest attention to the question of general relief from the intolerable burden of military expenditure is no mere rumor. The increase of the British Navy does not seem to him, or to Russians in general, a sign pointing in the right direction. It is difficult for Continental observers to understand that it is solely by the maintenance of a supreme navy that England can escape the crushing burden of universal military service. She has, roughly speaking, only 100,000 soldiers, because she has a navy which is the mistress of the seas. Reduce the navy, and instead of 100,000 men she might have to place 1,000,000 under arms. Hence, her naval expenditure, great as it may appear, is not a quarter what she would have to spend on the army if she economized on the fleet. How heavily the blood tax falls upon those nations less fortunately placed, may be seen from the following figures given in Mr. Forbes' article in the *Forum* on the prospects of peace and war in Europe:

	PEACE STRENGTH.			WAR FOOTING.		
	Men.	Horses.	Guns.	Men.	Horses.	Guns.
France. . .	538,738	122,000	2,810	2,715,600	800,000	4,500
Germany. . .	593,550	120,000	2,964	2,440,000	562,150	4,430
Russia.	1,033,661	150,000	2,200	2,411,105	463,000	5,200
Austria. . . .	319,235	65,500	1,000	1,590,000	292,000	2,140
Italy.	238,000	52,000	869	1,253,200	134,000	1,620
Totals . . .	2,723,184	509,500	9,834	10,413,905	2,251,150	17,890

Small compared with these gigantic totals are the figures that express England's naval strength. When the additional men and boys voted this year join their ships, the total force afloat will amount only to 8 per cent. of the troops of Russia on a peace footing, while on a war footing France could put ten horses into the field for every sailor England has on the sea. The official programme for the strengthening of the fleet proposes to begin the construction this year of seven first-class battleships, six cruisers of the second class, and two sloops. This is the first chapter of a five-years' programme of naval construction which the Admiralty have drawn up and will adhere to, although the Liberals refuse to follow the precedent of the Naval Defense act, and ask for legislative sanction for their scheme. More significant even than the

proposed addition of first-class battleships is the fact that the number of men and boys in the fleet has been raised from 76,700 to 83,400, an increase of 6,700. The net amount of the naval estimate is £17,366,100, an increase of £3,126,000 over the amount voted for last year. In 1883 the number of seamen was 56,950, and the naval estimates for the year were £11,157,290.

The Pope and the French Republic.

Peter's Pence have been falling off of late, as a practical hint to the Pope that French Royalists resent his recognition of the Republic. But it would seem that the policy of the Pope has already justified the wisdom of its author. M. Spuller last month proclaimed from the Tribune that the times had changed. The Church had become converted to the Republic, and a new policy was therefore necessary in which there must be a spirit of renovation, liberalism and tolerance. Still more significant was the decision that the French Cabinet should attend in a body a solemn service to be held in a Parisian church in honor of Jeanne D'Arc, on April 22. The attendance of French Republican ministers at a Catholic religious service in honor of the French Catholic heroine just beatified by the Pope, is a signal demonstration of the success of the Pope's policy, which outweighs more than a thousand times all the falling off in the contributions of the French Royalists.

A Contrast in Civism.

Two boys were fighting in an American school. The teacher, separating them with difficulty, asked, "What is the matter?" "Sir," said Boy No. 1, with the fierce fire of a just wrath in his blazing eyes, "I am not going to hear my father insulted." "Why," said the teacher, "what has he done to insult your father?" "He said my father had been an alderman," answered the lad, "and I would not stand it, nor would any one else." Contrast that old story with the spectacle witnessed in London the day Lord Rosebery became Prime Minister of the Crown. The new Premier, who is a member for the democratic constituency of East Finsbury, took his seat as usual in the London Council side by side with John Burns, Ben Tillett, Lord Carrington, the Duke of Norfolk, and the rest of the members of that body. These contrasted incidents illustrate the difference between city government in the British Empire and in the United States.

Municipal Imperialism.

Lord Rosebery may be said to have found the London County Council a stepping stone to the Premiership. The government of the greatest of the cities of the world is no unfit training for the government of an Empire. At a meeting in St. James's Hall on March 21, which expressed "London's welcome to England's Premier," Lord Rosebery frankly avowed that a new spirit was passing from municipal into imperial politics; and that henceforth the improvement of the lot of the worker and the toiler will take precedence of constitutional reforms. He attributes this to two things:

1, The suffrage having been made accessible to all, England is being governed for all; and, 2, "we have in the course of lowering the suffrage somewhere or another hit upon the conscience of the community." The supreme test of all governments will be how far their policy is a "living and ennobling effort to carry into practical politics and practical life the principles of a higher morality." Therefore Lord Rosebery, anticipating his own prophecy, descending from the platform of politics and speaking straight to the hearts of the people, said: "A plague on both your Houses; a plague on all your parties; a plague on all your politics; a plague on your unending discussions which yield so little fruit. Have done with this unending talk; come down and do something for the people!" There is an echo here of Cromwell's famous apostrophe to the Rump Parliament, "Come, come, we have had enough of this; I will put an end to your prating. Call them in!" Whereupon Colonel Worsley's musketeers promptly appeared, and the Rump of the Long Parliament vanished into limbo, attended, as Cromwell afterwards said, "with not so much as the barking of a dog."

A Cromwellian Premier. Certainly, since the Commonwealth, England has had no First Minister so Cromwellian as Lord Rosebery. For, as Cardinal Manning justly observed, the note of Cromwell's policy was the combination of Imperialism abroad with a Condition-of-the-People policy at home. It is significant that the first Social Democratic Ministry England has ever had should begin its career by a programme of naval construction which probably had as much to do with Mr. Gladstone's retirement as the cataract on his eyes; and that its chief should have accentuated as the key-note of his policy a determination to carry into practical politics the principles of a higher morality. There are many who have scoffed at the idea of a religious substratum to the Premier's character, chiefly, it would seem, because he has a colt entered for the Derby. But people may bring a conscience to their work even if they breed racehorses; and already signs are not lacking that Lord Rosebery is capable of appealing to the moral sense of the nation with all the fervor and earnestness which made some of the speeches of Mr. Bright read like paraphrases of the Hebrew prophets.

"The Predominant Partner." One quality even his opponents cannot deny to the new Prime Minister. He has not graduated in vain in the school of Prince Bismarck. He is audaciously frank. He has already created no small fluster in his own camp by the candor with which he admitted that until England was converted to Home Rule, Home Rule was practically unattainable so long as the House of Lords remains in its present mood. Yet nothing is more obviously true. The veto of the House of Lords is absolute. You cannot get around it, or over it, or under it, excepting by inducing the Lords to change their minds. The constitutional method of converting the Peers is by increasing the strength of the Liberal majority, and that can practically be obtained only by

converting a certain number of English constituencies from Unionism to Home Rule. Mr. Gladstone was of opinion that if he had been able to send up the Home Rule bill backed by a majority of one hundred, or even of eighty, the Lords would not have thrown it out. They rejected it because the majority was only thirty-four, and England, "the predominant partner," cast a majority of sixty-nine votes against the bill. It is therefore as demonstrably clear as any proposition in Euclid, that until the Lords can be induced to abandon their present attitude of irreconcilable opposition, Home Rule is unattainable. Lord Rosebery admitted this frankly and fully. As an honest man he could do nothing else, but his admission created a panic that for a day seemed as if it would wreck his Ministry. His exact words used in the debate on the address were as follows:

The noble Marquess—Lord Salisbury—made one remark on the subject of Irish Home Rule with which I confess myself in entire accord. He said that before Irish Home Rule is conceded by the Imperial Parliament; England, as the predominate member of the partnership of the three kingdoms, will have to be convinced of its justice.

What Lord Rosebery Meant. So great was the consternation, that Mr. Morley had to explain that Lord Rosebery could not possibly have meant what he obviously did mean; and Lord Rosebery himself at Edinburgh bent so far before the storm as to explain, with much elaboration, that even if England returned a majority of forty-five against Home Rule, the majority might still be large enough to induce the Peers to waive their opposition. In that case, of course, Home Rule would be possible. Lord Rosebery's point was not that from an abstract point of view England must return a Home Rule majority before Home Rule is possible, but that while the Peers maintain their present attitude, as a matter of fact Home Rule is impossible, nor is there any way of inducing them to change it save that of converting the English electorate so as to increase the Home Rule majority. The only objection to this that can be raised comes from those who honestly believe that it is possible by a course of intimidatory agitating to cow the Peers and compel them to pass the bill. But it is obvious that with a solid majority in the House of Commons of sixty-nine English votes, the English are not going to rise in their might and threaten to throw the Peers into the Thames. As for the other parts of the three kingdoms, they do not count for a red cent when it is a question of cowing the Peers. The Peers can be cowed when England is aroused. They cannot be intimidated by the stormiest agitation in Scotland, Ireland, or Wales. But England is not going to rouse itself to rend the Peers for doing what the majority of England's elected representatives think they ought to have done.

A Baffling Issue. This was not the only "indiscretion" of which Lord Rosebery has been guilty, for the wire-puller and the log-roller think that there is nothing so indiscreet as a frank and candid expression of opinion. In approaching the

question of the House of Lords, Lord Rosebery honestly admitted that, while the present position of the Second Chamber seemed to him full of peril, he could see no way out of the *impasse*. He had thought over the subject for four years, with the result that he had no suggestion to offer. All that he could say was that, if the nation could suggest anything, Ministers would be only too glad to carry out its wishes. Unfortunately, the nation on this question is even more at sea than Lord Rosebery. The Liberals have not made up their minds whether it is better to end or to mend the Second Chamber. Lord Rosebery wishes to mend the Peers. Mr. Labouchere wishes to end them. Confusion reigns in the Camp of Agramont. There are many Liberals who would prefer the House of Lords to continue as it is rather than see it converted into a real senate with co-ordinate authority not only in theory but in fact. The House of Lords is about the most impotent Second Chamber that could exist in England. To mend it would be to strengthen it, and every addition of strength would tell against the cause of progress and of reform. Lord Rosebery, therefore, frankly admitted that nothing could be done, much as he would like to do something; he bows to the force of circumstances, and waits for orders which will not come this side the general election. His exact words were as follows:

I have been thinking of remedies for many years past. . . . I have not been able to find them But, ladies and gentlemen, I leave that subject to your serious consideration. If it is to be dealt with by the present Government it can only be dealt with by the backing, on the summons, and on the inspiration of a great popular force. Without that backing, without that inspiration, and without that summons we are absolutely impotent. We want your guidance and your direction, and when we have it we shall be prepared to take what measures you may inspire.

Policy of the New Government. 'So far as can be gathered from Lord Rosebery's speeches, which certainly do not lack in explicitness, the Government has resolved upon an extensive programme—chiefly administrative so far as it is practical, and legislative only for purposes of electioneering. For no one really expects parliament to pass anything at this session. All that members can do is to fill their shop window with the showiest and most attractive goods, and then to blame the House of Lords for depriving the public of the opportunity of enjoying them. As administrators they can do more; and they are doing it. The lessons learned in the London Council Gardens are to be utilized at Downing Street. The State is to become a model employer. The eight-hours day is to become universal in all government establishments; fresh swarms of inspectors, male and female, are to be let loose upon all industries; the Home Office is to redouble its warfare against sweating. In short, the programme of the Fabian Society of Socialists is to be carried out so far as is humanly possible, having due regard to the exigencies of an Exchequer which displays a falling off of revenue and an increase of expenditure. In legislation members are pledged to the following array of measures:

Registration bill.
Evicted Tenants' bill.
Employers' Liability bill.
Welsh Disestablishment.
Scotch Disestablishment.
Local Option.
Crofters' Legislation for Lease-holders.

Scotch Local Government.
Accidents in Industry: Public Inquiry.
Industrial Disputes: Conciliation.
Equalization of Rates (London) bill.

In addition to these measures, the government will give facilities to the Eight-Hours bill for miners, the ministers supporting it individually with the exception of Mr. Morley, and will support energetically London's bill for "betterment" and the taxation of ground rents or site values. The budget deals with the "death duties," and the Ministry opens an immense number of questions which will be left over for the general election to deal with, and for the parliament after the next to settle.

The Chances of the General Election. The ministers are hoping to hold on till next spring. But the more sanguine do not expect to pass any measure this year except the budget, and possibly "One Man, One Vote." All the rest of their bills are for show, not for service. If the Lords throw out the Registration bill, it will help the cry for the abolition of their veto and precipitate a dissolution. If they pass it, there will be no dissolution until the new register is prepared. The danger which the Liberals run is that the social democratic programme of the Rosebery administration may drive off the few rich men still left in the Liberal ranks.

The Case for the Eight-Hours Day. Last month a new Ministry was formed in England, the war in Brazil was brought to a close, the Russo-German treaty was signed, and there was a report of the obscure beginnings of a movement in high quarters in favor of a reduction in military expenditure; but so far as the mass of men are concerned it is possible that a simple experiment carried on in a Lancashire ironworks exceeds all these imposing political and military events in intrinsic importance. Mr. William Mather, well-known as a public-spirited, clear-headed ironmaster, last month published a report as to the effect of the eight-hours system on the output of a great industrial establishment. The Salford Iron Works employ 1,500 men. They had been working for fifty-three hours a week. For the purpose of a scientific economic experiment the hours were reduced a year ago to forty-eight, and careful attention was given to note the changes which this produced. Mr. Mather's experience, as published in the *London Times* of March 28, seems to be decisive. The reduction of hours by ten per cent. in the week practically left the amount of work done unaltered, for the reduction of a half of one per cent. was balanced by a corresponding saving in other directions. The *Times* is compelled to admit that Mr. Mather's experiment is conclusive, as far as any experiment may be said to be conclusive; and we may the more assuredly take it that an eight-hours day is not only desirable from the point of view of humanity, but is economically advantageous to the employer, at least in many great industrial lines.

*The Result
of Mr.
Mather's
Experiment.*

Mr. Mather's experiment does not stand alone, but it is the most remarkable of its kind. It has convinced the British government, which has now introduced the eight-hours system into the dockyards and arsenals; and it will probably avail to carry the Eight-Hours bill for miners. It is difficult to overestimate the importance of this demonstration of the superiority of the eight-hours day. It will be felt not only in England but throughout the whole world. Whether it will tend in favor of a legal enactment of an eight-hours day is another question. It may operate in an opposite direction. If English employers are convinced by the experience of Mr. Mather and his experiment in his iron-works at Salford; of Mr. Allen in his engineering works in Sunderland; and of the British government in their arsenals and dockyards, that it is better to work forty-eight hours a week rather than fifty-three, they may adopt the forty-eight hours week so generally as to give almost irresistible strength to the argument of those who believe in voluntary action rather than in State coercion. On the other hand, it is quite possible that employers may join with employed in demanding a legal sanction for the eight-hours working day, which will have practically been fixed by experiment and negotiation before being presented for the legislative imprimatur.

*Mr. Gladstone's
Address to His
Constituents.*

England's Grand Old Man has given an eloquent exhortation upon the needs of the times. Mr. Gladstone's letter to his Midlothian supporters is one of the notable utterances of recent times. He sums up the history of the last sixty years as the greatest legislative and administrative period of British annals, whose prominent note is that of emancipation, political, social, moral, intellectual. He contemplates the future with some forebodings. There is opening, he thinks, a period of possibly greater moral dangers, which will bring a great ordeal to those classes now becoming largely conscious of power, who have never heretofore been subject to its deteriorating influences. As a last word, he warns the new depositaries of power against the mistake of their predecessors:

Now is the time for the true friend of the country to remind the masses that they owe their present political elevation to no principles less broad and noble than these—the love of liberty, and of liberty for all without distinction of class, creed, or country, and the resolute preference of the interests of the whole to any interest, be it what it may, of a narrower scope.

*The Late Sena-
tors Colquitt
and Vance.*

Our obituary record this month contains the names of two Senators of the United States, both of whom had rendered public services to their respective States in many different capacities and through long periods of years.

From photographs by Bell, Washington, D. C.

THE LATE SENATOR COLQUITT, OF GEORGIA.

THE LATE SENATOR VANCE, OF NORTH CAROLINA.

THE LATE GEORGE TICKNOR CURTIS.

Senator Alfred H. Colquitt, of Georgia, saw active fighting in the Mexican war, and subsequently attained the commission of a major-general in the Confederate army. As Governor of his State and as one of its representatives for the past ten or eleven years in the United States Senate, he had grown constantly in the esteem of his fellow citizens. Senator Zebulon B. Vance, of North Carolina, like his colleague Senator Colquitt, had for a year or more been in broken and declining health. He was just completing his sixty-fourth year, while Senator Colquitt had reached the allotted threescore years and ten. But although not a man of greatly advanced years, Senator Vance had entered public life so early that he had been in the thick of it for more than forty years. He served as Representative in two Congresses before the war, and at the outbreak of the conflict entered the Confederate army; but in 1862 he was diverted to civil life by his election as Governor of North Carolina, and he was chosen to a second term in 1864. He was a prominent figure in the affairs of his State during the reconstruction period, was elected Governor for the third time in 1876, and for the past fifteen years had occupied a seat in the United States

Senate. He was a man of great shrewdness, much homely wit, and rare gifts as a *raconteur*. Both Senator Colquitt and Senator Vance were men who maintained throughout life the closest touch with the plain people of their States, and their private virtues as well as their faithful and useful public services will be long cherished among the people whom they have so honorably represented. The Governor of Georgia, on Speaker Crisp's declination of the office, appointed the Hon. Patrick Walsh as Senator Colquitt's successor. On April 20 it was announced that the Governor of North Carolina had named ex-Governor Thomas J. Jarvis to occupy Senator Vance's vacant chair at Washington.

*Some Great
Lawyers Who
Have Lately Died.*

The past month has witnessed the demise of some very distinguished leaders in the profession of the law, both in this country and in England. Most eminent of all was David Dudley Field. His service to this country and to the world through his lifelong devotion to the task of a reform of legal procedure and a reduction of law to the form of simple written codes, is a service which has already yielded a prodigious

THE LATE S. TEACKLE WALLIS.

...ritage and one which will continue through its acquired momentum to achieve new triumphs for a long period yet to come. We are glad to be able to give our readers this month a lucid account of the nature and value of Mr. Field's public services from the pen of another distinguished law reformer, Mr. Austin Abbott, who had at different times been associated with Mr. Field on official commissions for purposes of law reform or codification. Mr. George Ticknor Curtis, another eminent American lawyer of long and varied public career, has been called to his rest in the eighty-second year of his age. He was one of our highest authorities upon the history and law of the Constitution, and he made many important contributions to the literature of American law, history, and political science. It happens that while the fame of David Dudley Field was international and that of George Ticknor Curtis national, John

Graham's was rather a professional and local fame. He was one of the most brilliant and remarkable men ever called to the American bar; and among New York lawyers the traditions of his genius and eloquence and the anecdotes of his eccentric ways will survive for a long time. These allusions to great legal luminaries who have lately passed away would be seriously incomplete if no mention were made of the late Mr. S. Teackle Wallis, of the Baltimore bar, whose name for forty years has been a household word in Baltimore and Maryland, and whose greatness, as a lawyer, a publicist and a man, fully entitled him to the highest national recognition. Nothing but the accident that he was a lifelong political reformer and that political reform had fared badly in the State of Maryland, prevented his going to the United States Senate, for which post the nature of his talents and attainments conspicuously fitted him. From England has come the report of Lord Hannen's death. His was regarded as one of the greatest legal and judicial minds and careers that England has produced in the Victorian period. His prominence as a judge in the Parnell trial will be generally remembered by Americans, and his recent service as a member of the Behring Sea tribunal of arbitration will be still fresher in the public memory. Some days previous to Lord Hannen's death another great English judge, Sir James Fitzjames Stephen, had passed away. He was an eminent authority upon several branches of law, and will perhaps be longest remembered for his monumental history of English criminal procedure. He was also a graceful essayist, and has made charming contributions to our prose literature. Still more recent than the death of Lord Hannen is that of Lord Bowen, another of England's most eminent and learned lawyers and most famous judges: who also, even to a higher degree than Sir James Fitzjames Stephen, was a finished and versatile man of letters, and producer of literary wares outside the sphere of his profession.

THE LATE SIR JAMES FITZ-JAMES STEPHEN.

THE LATE BARON HANNEN.

RECORD OF CURRENT EVENTS.

March 21.—The New Jersey Supreme Court makes a decision upholding the Republican Senate as the lawful body....The Italian Chamber of Deputies accepts the government's budget calling for taxes of 50,000,000 lire, and prescribing economies to an equal amount....Germany is visited by violent snow-storms which impede travel... An explosion of dynamite in the harbor of Santander kills ten men and injures thirty.

March 22.—The U. S. Navy court martial to try Commander Oscar F. Heyerman for the loss of the war ship *Kearsarge* convenes at Brooklyn Navy Yard....Heavy fall of snow and fierce winds in the Northwest....Stay of execution granted in case of Prendergast, the murderer of Carter Harrison, for examination as to sanity....Iowa legislature passes a local option liquor law permitting the licensing of saloons under certain conditions....Twenty persons injured by a bomb explosion in a church at Grenoble, France...The British declare war on the African King Kabaraga.

March 23.—Mobs of students and citizens are dispersed by troops in Buda-Pesth....The Belgian premier insists on the resignation of himself and his cabinet...The Pope's encyclical to the Bishops of Poland, Russia, Austria and Prussia is published....A fresh outbreak of cholera is reported at Constantinople.

March 24.—The Colorado Supreme Court decides that Governor Waite had no right to order out the militia to induct into office his appointees to the Denver fire and police boards....Peru authorizes the Swiss Federal Court to arbitrate claims of Peruvian creditors.

March 25.—The new treaty between the United States and China is made public....A congress of Austrian Socialists is held at Vienna.

March 26.—A cold wave passes over the eastern half of the United States, greatly injuring fruit trees and growing crops....A comet is discovered between Leo and Leo Minor by Prof. Denning, of Bristol....The King of Denmark states that Russia, Austria, Italy and Spain are willing to co-operate in reducing military expenditures....Don Idiarte Borda elected President of Uruguay.

March 27.—Sixteen Gravesend (N. Y.) election inspectors are sentenced to terms of imprisonment varying from twenty-nine days to six months, with heavy fines, for election frauds....The United States and England agree on a new *modus vivendi* for co-operation to protect seals from May 1 to July 31; they also ask the co-operation of Russia, Japan, and Corea....In the Canadian House of Commons the Ministry announces a reduction of the tariff, causing a loss of revenue amounting to \$1,500,000.

THERE WAS AN OLD LADY WHO LIVED IN A SHOE,
She had so many bad children she did not know what to do.

From *Judge*, April 21, 1894.

ANOTHER HIDE TO BE TAKEN.

UNCLE SAM (to the wolf at the door): "One of you pesky critters comes around here about every twenty years; but this is the gun that gits you!"—From *Puck*, April 11, 1894.

March 28.—The Congress of Socialists at Vienna declares in favor of a general strike as a means to obtain universal suffrage.... Opening of the exhibition in connection with the Medical Congress at Rome.... Opening of the Women's Congress at Berlin.

March 29.—President Cleveland vetoes the Bland Seigniorage bill.... The Emperors of Germany and Austria meet at Abbazia.... The International Medical Congress opens at Rome.... In the New South Wales Legislative Assembly, appropriation bill passed for the public expenditure of the current financial year.... Bill for the repression of anarchism in Switzerland adopted by the State Council at Berne.

March 30.—Three South Carolina counties are in rebellion against the State authorities because of the dispensary law; in a fight at Darlington two whisky spies and two citizens are killed.... A new Uruguayan Ministry is selected by President Borda.... Several Samoan tribes revolt in consequence of Chief Justice Ide's punishment of their chiefs; King Malietoa's soldiers defeat the rebels, but other chiefs start a rebellion.

March 31.—Governor Tillman issues a proclamation declaring two South Carolina counties in insurrection; the State troops refuses to move at his orders; attempts by the Governor to restrain telegraph and railroad companies ignored.... A long struggle in Denmark over the annual budget ends in a compromise.... An armistice is effected in Samoa.

April 1.—Three hundred militiamen under orders from Governor Tillman occupy Darlington, S. C.; nearly all of the Governor's Guards throw down their arms.... Kosuth buried in Buda-Pesth; the funeral procession is five miles long.

April 2.—Twenty thousand striking miners in the Connellsville coke region form a mob, attacking plants and assaulting workmen.... The tariff debate is opened in the Senate by Senator Voorhees.... Patrick Walsh is appointed to the vacant Georgia Senatorship, after the declination of Speaker Crisp.... A desperate battle is reported from the Soudan between the Sultan of Bornu and an invading force under Rabah, formerly a slave of Zebehr Pasha.

April 3.—Governor Tillman issues a proclamation assuming control of the police and marshals in all the cities and towns of South Carolina, under a State statute.... Municipal elections in Ohio, Illinois, Michigan, Wisconsin, Kansas, Missouri, Colorado, and Washington, result

generally in Republican gains; in Colorado, women vote for the first time in other than school elections, and poll a considerable vote; shooting affairs occur at the polls in Chicago and Kansas City.... The House of Commons votes 180 to 170 that it would be desirable to establish a local legislature for Scotland.... M. Nicolaievitch is summoned to form a new Servian cabinet.... Don Rafael Yglesias is elected to succeed Don José J. Rodriguez in the Presidency of Costa Rica.

April 4.—The Republicans carry Rhode Island by increased pluralities, re-electing Governor Brown and securing 102 of the 108 members of the Legislature.... The naval court martial sentences Commander Heyerman to two years' suspension on waiting orders and recommends clemency.... Six persons killed and one fatally wounded in riots in the Pennsylvania coke regions.... Another bomb explosion in Paris injures three persons.

April 5.—Governor Tillman issues a proclamation restoring the civil status in South Carolina.... The American Behring Sea bill passed by the House of Representatives and sent to the President, and the British bill passes its second reading in the House of Commons.... A Radical-Liberal Cabinet formed in Chili, but resigns immediately on the refusal of President Montt to receive its members.... One Samoan chief sent to prison for two years, and several others fined, for inciting the natives to rebellion.

April 6.—President Cleveland signs the Behring Sea bill.... The South Carolina militia are dismissed and sent home.... The Rosebery Government is defeated on a minor measure.

April 7.—Loss of life is caused by an explosion in a fireworks factory at Petersburg, Va., and by a premature explosion of giant powder at Brinton, Pa.... Emperor William is received by King Humbert at Venice.

April 8.—Four deaths are caused by the wreck of a tenement house in Memphis, Tenn.... Arms shipped by Cuban revolutionists from New York are seized at Puerto Principe.

April 9.—Senator Hill, of New York, makes a speech in the Senate attacking the income tax feature of the Wilson bill.... The burning of a hotel and theatre in Milwaukee, Wis., causes the death of eight firemen.... The Behring Sea bill passes the House of Commons.... Admiral Da Gama escapes from the Portuguese warship at Buenos Ayres on which he was confined.

THE TWO RIVAL TARIFF SYSTEMS.

Mark the superiority of our system over Uncle Sam's in the matter of expedition. Foster accomplished his tariff revision in a day; Wilson has been months getting his bill through at Washington—and it isn't half through yet. 'Rah for our system!—From *Grip* (Toronto).

April 10.—Rear-Admiral Benham, U. S. N., retired at age limit....A Congressional committee at Milwaukee makes inquiry into Judge Jenkins' Northern Pacific strike-enjoining order....The defection of Emilio Castelar from the Moderate Republican ranks, and his adherence to the Monarchists, is announced in the Spanish Cortes.

April 11.—Fifteen sailors lose their lives in two wrecks on the New Jersey coast....The United Mine Workers' Convention at Columbus, Ohio, orders a general strike on April 21....The Newfoundland Ministry resigns as the result of a series of embarrassments growing out of exposures of bribery and corruption on the part of some of its members.

April 12.—The burning of glucose works at Buffalo entails a loss of \$1,200,000; twenty-two employees are missing....The Behring Sea bill passes its second reading in the House of Lords; Lord Kimberley says that the two Governments will soon enter into a convention for settling claims for seizures....With a loaded bomb in their possession, two Anarchists arrested in Rome; it is believed that they intended to blow up the Italian Chamber of Deputies....Peixoto's forces have retaken Paranagua.

April 13.—The House of Representatives adjourns when no quorum can be obtained to act on the journal;

April 12.—Rt. Rev. Bishop Horatio Southgate, formerly a Protestant Episcopal missionary to Turkey....Prof. W. G. Hammond, Dean of the St. Louis Law School, a writer on legal topics.

April 13.—David Dudley Field, the eminent lawyer and code-maker....Joseph B. Kershaw, a major-general in the Confederate Army....Roswell D. Sawyer, an American artist at Rome.

April 14.—General Henry W. Slocum... Senator Zebulon B. Vance, of North Carolina.

April 15.—Ex-Governor James M. Harvey, of Kansas....Dr. Joseph Workman, superintendent of the Toronto Asylum for the Insane.

April 16.—Count Adolphe Frederick Von Schack, the German traveler and author....James P. Gillard, a noted Canadian linguist.

April 17.—Ernst Knabe, the piano manufacturer, of Baltimore, a friend of Von Bülow and other great pianists....Mrs. Lucy Rosetti, artist....Henry S. Ives, formerly known as “the Napoleon of finance.”

CONVENTIONS AND SUMMER GATHERINGS OF 1894.

EDUCATIONAL, SCIENTIFIC AND PHILANTHROPIC CONVENTIONS.

NATIONAL EDUCATIONAL ASSOCIATION.

THE school teachers and officers of the country are thoroughly represented each year in the sessions of the National Educational Association. It is expected that upwards of 10,000 of them will gather at Asbury Park, N. J., July 6-13. The meeting of the Council will occupy the first four days, and the sessions of the general Association will not begin until the 10th. The President this year is Superintendent Albert G. Lane, of Chicago, and the Secretary is Irwin Shepard, of Winona, Minn. It was intended to have the Association meet in the Northwest this summer, but satisfactory concessions could not be secured from the railroad companies, and the Association determined to come to a point where low rates could be had. In this decision the officers seem to have acted wisely, for their constituency is not blessed with large salaries, as a rule, and a maintenance of high fares would have meant the exclusion of thousands of teachers from the benefits of the meeting.

THE AMERICAN INSTITUTE OF INSTRUCTION.

The sixty-fourth annual meeting of the American Institute of Instruction will be held at Bethlehem, N. H., July 9-12. Dr. W. T. Harris, U. S. Commissioner of Education; President Eliot, of Harvard; President Tucker, of Dartmouth, and President Thwing, of Western Reserve, are among the speakers announced for this meeting. Mr. George H. Martin, the Massachusetts Supervisor of Schools, is President of the Institute.

UNIVERSITY CONVOCATION AT ALBANY.

The thirty-second University Convocation of the State of New York will be held July 5-7, Thursday, Friday and Saturday morning, to avoid collision with the National Educational Association, which meets the following week. The programme will be chiefly made up of the most important points in the report of the Committee of Ten on secondary education, each discussion to be opened by an opponent of the ground taken by the committee. A leading paper, also, will be that of Supt. A. S. Draper on “What the Regents Have Done for Elementary Schools.”

ADVANCEMENT OF SCIENCE.

The American Association for the Advancement of Science, under the presidency of Daniel G. Brinton, will meet at Brooklyn, N. Y., August 16-23, 1894. The various sections in which this body is organized cover most of

DANIEL G. BRINTON.

President Amer. Ass'n for the Advancement of Science.

the fields of scientific research in which American investigators are now at work, and these summer meetings always attract representative scientists from all parts of the country.

AMERICAN HISTORICAL ASSOCIATION.

The decennial of the organization of the American Historical Association will be celebrated by a meeting at Saratoga, September 10-13. The programme has not been definitely arranged, but it will embrace papers by President Andrews, of Brown University, by Rossiter Johnson, and by W. Lloyd Bevan. The Association will make excursions to interesting points of historical note near Saratoga.

AMERICAN LIBRARY ASSOCIATION.

Immediately after the Saratoga gathering the annual conference of the librarians, whose interests are so closely related to those of the historians in many ways, will be held at Lake Placid, in the Adirondacks, during the week of September 15-20. The programme is not yet arranged. Mr. J. N. Larned, of the Buffalo Library, is President of the Association this year.

AMERICAN ECONOMIC ASSOCIATION.

The officers and many of the members of the American Economic Association will be actively engaged during a great part of the summer in lecturing and giving instruction in the various summer schools and meetings East and West. The annual meeting of the Association will not be held till the Christmas holidays at Columbia College, New York City. Professor J. B. Clark, of Smith College, is President, and Professor J. W. Jenks, of Cornell, Secretary of the Association.

NATIONAL LEAGUE FOR GOOD ROADS.

The National League for Good Roads will join with the New Jersey State Road Improvement Association, in calling a general conference of all Road Improvement Associations in the United States, to be held at Asbury Park, N. J., between July 2 and 6, 1894, on the occasion of the National Editorial Convention at that place.

It is not intended at this meeting to form any national organizations or to take any combined action, but to discuss the general subject with the advantage of all the local information obtainable.

It is expected that some of the road machine companies will give an exhibition of road construction in all its branches, at that time and place.

Many of the leading railroad companies have expressed a desire to aid in the general movement for good roads by making very important concessions in the transportation of road materials, and it will be suggested to the companies to have representatives at this conference, for the purpose of promoting some concerted action in this direction.

The office of Road Inquiry of the U. S. Department of Agriculture is actively co-operating in the movement.

CHARITIES AND CORRECTION.

The twenty-first National Conference of Charities and Correction will be held at Nashville, Tenn., May 23-28. The subjects of charity organization, care of the insane, juvenile reformatories, the feeble-minded, child-saving work, prisons, nurses' training schools, etc., etc., will be discussed by the Conference.

The membership of the Conference includes members of State Boards of Charities, delegates from Charity Organization Societies, officers of public and private charitable and correctional institutions, official delegates appointed by the Governors of States, and all other persons directly or indirectly connected with charitable work. All persons included under this general description are invited to attend the Conference, and the boards in charge of charitable or correctional institutions, public or private, are invited to send delegates.

The Conference is non-sectarian and non-political; its aims are purely scientific and philanthropic.

A large attendance is expected. L. C. Storrs, of Lansing, Mich., is President; A. O. Wright, Madison, Wis., Secretary, and John M. Glenn, of Baltimore, Treasurer.

An evidence of the growing interest in charitable effort along all lines is afforded by the opening during the past year of a magnificent building in New York City devoted to the work of various national and local organizations.

RELIGIOUS MEETINGS.

THE Y. M. C. A. JUBILEE.

One of the important religious gatherings of the year will be the World's Conference of the Young Men's Christian Associations, to be held at London, June 1-6. At that time the semi-centennial of the parent association will be celebrated, and it is expected that George Williams, the founder of the organization, will have a part in the exercises. This anniversary will have a peculiar interest to Americans, for while London can claim the honor of having originated the association idea, it is on this side of the Atlantic that the greatest progress has been made in developing that idea. Some 200 American delegates will probably be present at the London Conference. It has been announced that the Associations, on this occasion, will receive special attentions from the Queen and the Lord Mayor of London, and that the hospitalities of the nation will be extended to them.

CHRISTIAN ENDEAVOR CONVENTION.

The great annual meetings of the Christian Endeavor Societies have come to be regarded as a regular institution in the summer life of thousands of Americans. This year the convention is to be held at Cleveland, July 11-15. This will be the thirteenth international convention, and while in point of numbers it may not reach the high mark set by some of its predecessors, there is every reason to expect an enthusiastic and interesting gathering. The national convention for England is to be held May 12-15.

WOMEN'S CHRISTIAN TEMPERANCE UNION.

The next annual meeting of the National W. C. T. U. will be held at Cleveland in November.

BAPTIST YOUNG PEOPLE'S UNION.

During the past three years an organization has grown up in Baptist churches similar in methods and aims to the Y. P. S. C. E. The Baptist Young People's Union of America will hold its third annual convention at Toronto July 19-22. An attendance of more than 5,000 delegates is expected. John H. Chapman, of Chicago, is President of the Union, and the board of managers and executive committee are composed of men eminent in the councils of the denomination.

DENOMINATIONAL MEETINGS.

The Baptist anniversaries of 1894 will be held at Saratoga, beginning May 21. An attendance of from 1,200 to 1,500 is expected. The two women's missionary societies of the Church, one of which has its headquarters in Boston and the other in Chicago, will hold a joint meeting for the discussion of the general question of missionary work in America. The American Baptist Education Society, the organization which was instrumental in founding the University of Chicago and through which John D. Rockefeller gives largely to institutions of learning throughout the country, will hold its annual meeting at this time. The sessions of the home and foreign missionary societies are always interesting and well attended.

The American Baptist Home Missionary Society has had an existence of sixty-two years and has expended over \$8,000,000 in the support of missionaries, the erection of meeting houses and the sustaining of educational work among the negroes in the South, employing more than a thousand missionaries and teachers, and preaching the Gospel to sixteen nationalities. The American Baptist Missionary Union has charge of the work in foreign lands and last year raised for that object over a million dollars. It has made 175,000 native converts. With these societies the denominational publication society will meet and report progress in its work of publishing books and tracts and organizing Sunday schools in the West and South. The Southern Baptist Convention is to be held at Dallas, Texas, May 11-15.

The missionary work, both home and foreign, of the Methodist Episcopal Church will be considered at the annual meeting of the general missionary committee of that Church, to be held this year in Brooklyn, N. Y., about November 10. At the same time the topics of church extension and work among the freedmen of the South will be discussed.

The Congregational Home Missionary Society will meet this year at Omaha, Neb., June 6-10. General O. O. Howard will preside at all the sessions.

The American Missionary Association, which carries on the work of the Congregationalists among the colored people of the South, will hold its annual meeting at Lowell, Mass., October 23-25.

The American Board of Commissioners for Foreign Missions, which is supposed to represent the Congregational churches of the country in foreign work, is to assemble at Madison, Wis., October 10.

The next meeting of the Congregational National Council will be at San Francisco in the spring of 1895.

The American Church Missionary Society, representing the Protestant Episcopal Church and serving as an auxiliary to the Board of Missions of that body, will probably hold its annual meeting and anniversary exercises in November. The date is not yet determined. The President is Gen. Wager Swayne, U. S. A.

The Presbyterian General Assembly will convene at Saratoga May 17. Popular interest in the proceedings of this body can hardly be expected to reach the pitch attained during the Briggs trial last year, but various questions of importance to the denomination remain to claim attention.

The fourteenth General Council of the Reformed Episcopal Church will be held at Chicago May 23.

The M. E. Church, South, will hold its general conference at Memphis, Tenn., in May.

LIBERAL RELIGION.

A call has been issued for an American Congress of Liberal Religious Societies to meet at Sinai Temple, Chicago, May 22-24. The main object of this conference is to secure "a nearer and more helpful fellowship in the social, educational, industrial, moral and religious thought and work of the world." This call is signed by a large number of the most prominent leaders in liberal thought throughout the country.

SOCIETIES AND FRATERNAL ORDERS.

AMERICAN BAR ASSOCIATION.

At Saratoga, August 22-24, will occur the annual meeting of the American Bar Association. The proceedings will include the President's address, by the Hon. Thomas M. Cooley, several papers and discussions, and reports of

HON. THOMAS M. COOLEY,
President of the American Bar Association.

various committees. The Secretary of the Association is John Hinkley, of Baltimore.

AMERICAN MEDICAL ASSOCIATION.

Another important gathering of professional men will take place at San Francisco on the first Tuesday in June, when the leading physicians of the country will assemble either in person or by delegates at the convention of the American Medical Association. The Association is organized in twelve sections, on the plan of the Association for the Advancement of Science, to discuss topics in the various departments of medicine and surgery. A general address on medicine will be given by Dr. Hughes, of St. Louis, and one on surgery by Dr. La Place, of Philadelphia. The President of the Association is Dr. James F. Hibberd, of Indiana, and the Secretary is Dr. W. B. Atkinson, of Pennsylvania.

GRAND ARMY OF THE REPUBLIC.

Active preparations are in progress for the twenty-eighth National Encampment G. A. R. at Pittsburg, September 10-15. General John G. B. Adams, of Lynn, Mass., is Commander-in-Chief, and James F. Meech Adjutant General. The railroads have made the usual reductions in rates, and it is believed that the attendance will be large, though for several years a marked decline has been noticed, due to the inroads of death in the ranks of the order.

SONS OF VETERANS.

The thirteenth Encampment of the Commandry-in-Chief, Sons of Veterans, will be held at Davenport, Iowa, August 20-24. Joseph B. Maccabe, of Boston, is Commander-in-Chief, and Charles K. Darling Adjutant General.

KNIGHTS OF PYTHIAS.

The Supreme Lodge of the World, Knights of Pythias, will be in session at Washington, August 28. This order has jurisdictions throughout the United States and Canada.

ODD FELLOWS.

The Sovereign Grand Lodge of the Independent Order of Odd Fellows will assemble this year at Chattanooga,

Tenn., September 17. It will be composed of 161 delegates, representing more than three-quarters of a million of members.

SCOTCH-IRISH IN AMERICA.

The sixth annual congress of the Scotch-Irish Society of America will be held in Des Moines, Iowa, from June 7 to 10, 1894. Not only members of the society but all Scotch-Irish people and their descendants throughout the country, and the local population without regard to nationality,

DR. JOHN HALL,
Member of the Scotch-Irish Society.

are invited to attend and participate in the exercises, which are all of a popular character.

The objects of the society are purely historical and social. It is entirely non-sectarian and non-partisan.

The addresses of welcome will be delivered by the Hon. Frank D. Jackson, Governor of Iowa, and John Scott, President of the State society. Among the distinguished speakers who will deliver addresses will be the Rev. Dr. John Hall, of New York; Col. William Preston Johnston, of New Orleans; the Hon. John A. Kasson, of Des Moines; ex-Senator McMillan, of Minnesota; Congressman Bryan, of Nebraska; W. C. Gray and Rev. Howard Johnston, of Chicago; the Rev. Dr. Hamilton, of Cincinnati, and others whose names will be given to the public at a later date.

Robert Bonner, of New York, is President, and A. C. Floyd, of Knoxville, Tenn., Secretary of this organization, which numbers in its membership many American citizens prominent in various walks of life.

LEAGUE OF AMERICAN WHEELMEN.

The National Meet of American Wheelmen will take place at Denver, August 13-18. Great preparations are being made for this gathering, which is one of the events of the year for bicyclists. Charles H. Luscomb, of New York, is President of the organization.

LABOR ORGANIZATIONS.

The Textile Workers will assemble at New Bedford, Mass., on the first Monday of May.

The Brotherhood of Locomotive Engineers will meet at St. Paul, Minn., on the second Wednesday of May.

The Switchmen's Mutual Aid Association will hold its annual convention at Evansville, Ind., on the third Monday of May.

The Brotherhood of Painters and Decorators is to meet at Buffalo, August 1.

The United Brotherhood of Carpenters and Joiners of

America will meet at Indianapolis on the third Monday of September.

During the same month the Brotherhood of Locomotive Firemen meet at Harrisburg.

The International Typographical Union will hold its annual convention at Louisville, Ky., October 8-13.

The American Federation of Labor holds its annual delegate convention at Denver, December 10.

The National Grange of the Patrons of Husbandry will hold its twenty-eighth session November 14, but the place of meeting has not been decided on.

AMERICAN SUMMER SCHOOLS.

CHAUTAUQUA.

The numerous and varied programmes of instruction and entertainment offered by America's great summer university on the banks of Lake Chautauqua are so well advertised throughout the country that hardly more than a brief mention of the work there will be expected or required by our readers. Elsewhere in this article reference is made to the schools of Christian Philosophy and Sociology to be held at Chautauqua in July under the auspices of two distinct national societies. Another organization to meet there in the first half of the month is the Ministerial Club, which will be under the charge of

MR. GEORGE E. VINCENT,
Ass't Chancellor Chautauqua System.

Bishop Vincent, and will be addressed by Dr. J. M. Buckley, President Harper, Bishop Hurst and other well-known speakers. During July, also, lecture courses will be given by the Hon. Theodore Roosevelt on "The Westward Progress of Civilization in the United States," by Dr. W. H. Tolman, of New York, on "Life Among the Poor in Cities," by Prof. Richard G. Moulton on literary topics, and by Prof. H. B. Adams on "Nineteenth Cent-

PROF. HENRY C. ADAMS,
Director Plymouth School of Ethics.

ury History." These courses will be followed by illustrated lectures on "Hawaii and Other Pacific Islands," by Mr. H. S. Benton, and on geological subjects by Prof. N. S. Shaler. The Hon Carroll D. Wright will give a series of addresses on "Industrial Problems." Illustrated lectures on "Central and South America" will be delivered August 12-18 by Courtenay DeKalb.

The Chautauqua College proper, of which President Harper, of the University of Chicago, is Principal, announces courses in English, German, French, Latin, Greek, history, mathematics, physics, chemistry, geology, zoölogy, economics, and social science. The session opens July 5 and closes August 16.

The Teachers' Retreat will be held during July. Walter L. Hervey, President of the New York Teachers' College, will act as Principal. The work of the Retreat is designed for those teachers who wish to spend four weeks in concentrated work in a special department. The departments are: Psychology and primary methods of teaching. English literature and composition, science, manual training, form-study and drawing. These courses will be supplemented with conferences and lectures.

The well-established schools of Sacred Literature, Music, Physical Education, and Expression, will be maintained at Chautauqua under practically the same management as last year, and a great number of miscellaneous classes will be open to students.

UNIVERSITY EXTENSION SUMMER MEETING.

The American Society for the Extension of University Teaching announces courses of lectures and instruction to be given in the buildings of the University of Pennsyl-

vania at Philadelphia during the month of July. The four departments of this summer meeting include, respectively, instruction in history, economics, music and pedagogy, and in addition a general programme of lectures on various topics is offered. American history is to be treated by Professors John Bach McMaster, W. H. Mace and Frederick J. Turner, and Dr. Edward Everett Hale. The meeting this year will bring together many of the foremost economists of the land—indeed, the economic department will constitute a meeting in itself.

President E. Benjamin Andrews, of Brown University; Professor J. B. Clark, of Amherst College and Johns Hopkins University; Professor F. H. Giddings, of Bryn Mawr College, and elected to the new chair of Sociology of Columbia College; Professor Arthur T. Hadley, of Yale University; Professor J. W. Jenks, of Cornell University; Professor Richmond Mayo-Smith and Professor E. R. A. Seligman, of Columbia College, and Professor Simon N. Patten, of the University of Pennsylvania, constitute the corps of instructors.

One of the most important courses will be that of Professor Jenks on the relations between economics and politics.

THE PLYMOUTH SCHOOL OF APPLIED ETHICS.

Courses in economics will be conducted this summer at Plymouth under the direction of Professor Henry C. Adams, of the University of Michigan, and a faculty of instruction almost identical with that of the Philadelphia meeting. Instruction will be largely devoted to a discussion of the relation between economics and social progress. In the departments of History of Religions and Applied Ethics, at Plymouth, the purpose of study in the light of a comprehensive theory of social development will be recognized in the adjustment of courses. The session of the school will begin July 12.

The complete programme of all the departments, when ready, will be mailed to any person sending name and address to the Secretary of the school, S. Burns Weston, 118 South Twelfth Street, Philadelphia.

SCHOOLS OF APPLIED CHRISTIANITY.

The American Institute of Christian Sociology, an organization formed one year ago for the purpose of study-

PROFESSOR HERRON,
Organizer Am. Inst. Christian Sociology.

ing the application of the principles of Christianity to the social and economic difficulties of the day, will hold two summer schools the present season, one at Grinnell, Iowa, from June 27 to July 4, and the other at Chautau-

qua, July 6-26. The former meeting is to be held under the auspices of the department of Applied Christianity in Iowa College. Addresses and lectures are to be given by Prof. Richard T. Ely, the Rev. B. Fay Mills, President George A. Gates, the Rev. John P. Coyle, Prof. Jesse Macy, Prof. J. R. Commons, Lr. Wm. Howe Tolman, Prof. George D. Herron, and others.

At the Chautauqua meeting, courses of instruction will be given by Professor Ely on money and private property, and by Professor Commons on political economy, taxation, and proportional representation. Other sociological topics will be presented by Ballington Booth, and others.

Professor Ely is President of the Institute; Professor Commons Secretary, and Professor Herron Organizer.

A SCHOOL OF CHRISTIAN PHILOSOPHY.

The next summer school of the American Institute of Christian Philosophy will be held at Chautauqua, from the 5th to the 12th of July. The programme has been selected with reference to the increasing interest manifest in the subject of Christian union.

The topics to be considered by the school will be grouped under the three heads of "The Incarnation," "The Church" and "The Reunion of Christendom." Among the lecturers announced appear the names of the Rev. J. H. Ecob, D.D., Dr. George Dana Boardman, Dr. M. D. Hoge, Chancellor McCracken, Professor Graham Taylor, Dean George Hodges, and President W. G. Ballantine. The late Dr. Charles F. Deems was succeeded in the presidency of the Institute by Dr. Amory H. Bradford, of Montclair, N. J. The Corresponding Secretary is the Rev. John B. Devins, 339 East Fourth street, New York City.

THE CATHOLIC SUMMER SCHOOL OF AMERICA.

The success of the school opened under Roman Catholic auspices at Plattsburgh, on Lake Champlain, in the summer of 1893, has inspired the management with still higher aims, and the announcements for the session of 1894, beginning July 14, indicate that unusual opportunities will be offered in the way of instruction by competent specialists. Bishop Spalding, Richard Malcolm Johnston,

George Parsons Lathrop, the Hon. W. C. Robinson, and Dr. James Hall, the veteran New York State Geologist, are among the lecturers announced. The fourth week, August 6-10, will be devoted to subjects appealing especially to teachers. A normal course of twenty-four lectures has been

REV. THOS. M'MILLAN.

outlined in which Principal George E. Hardy, President of the New York State Teachers' Association, and others will take part. Last year's school won fame in England, and it is expected that English Catholics will be represented at the coming session. The Rev. Thos. McMillan, C.S.P., is chairman of the Board of Studies.

THE NORTHFIELD SCHOOLS FOR BIBLE STUDY.

Picturesque Northfield in Northern Massachusetts has in recent years become famous for its summer schools for young women, young men and Christian workers in general.

THE NORTHFIELD SCHOOLS.

The list of speakers for 1894 will include many of those of former years, together with well-known men and women who have not yet been heard in Northfield; altogether making a teaching corps as strong as ever.

June 22-28 will be held the Young Women's Summer School for Bible Study and Training for Christian Service, to which are especially invited the students from the women's colleges and schools of the land, as well as all interested and active in work for young women.

The Young Women's Christian Associations of the colleges hold a summer conference in connection with the school. Last year nearly 200 members were present, representing forty-one schools and colleges, including Wellesley, Vassar, Smith, Mt. Holyoke, Boston University, Bryn Mawr, McGill, Montreal, Cornell, Syracuse, and institutions in England and Ireland. Other conferences will be held this summer at Lake Geneva, Wis., July 4-17, and at Cazadero, near San Francisco, July 11-18.

The Young Men's (Student) Summer School for Bible Study will be in session at Northfield from June 30 to July 12.

During the series of meetings, on July 4, the new Northfield Auditorium, with a seating capacity of 2,500, now building, is to be opened, and on that occasion Senator Frye, of Maine, will deliver an oration.

The General Conference for Christian Workers will assemble August 1 and continue in session until the 13th.

Among many prominent and able speakers of this convention may be expected Dr. F. B. Meyer, of London, and Dr. A. J. Gordon, of Boston.

Mr. D. L. Moody will be present at Northfield during the summer, and will have charge of the larger meetings besides speaking frequently from the platform.

LAKESIDE ENCAMPMENT.

In the group of assemblies and summer schools organized on the Chautauqua plan, though not organically connected with the parent institution, the Lakeside Encampment of Ohio has for years had a prominent place. The grounds are on the north of the peninsula which incloses the Sandusky Bay in Ottawa County, Ohio. A charming grove, bordering on Lake Erie, furnishes the location of what has now become quite a city of beautiful cottages, commodious and well-kept hotels, excellent places of merchandise and commodious buildings erected to accommodate the great gatherings of listeners and students who assemble by thousands to enjoy the summer courses of lectures, entertainments and studies provided by the programmes of the season. The session this year begins July 13 and closes August 7. The Rev. Dr. B. T. Vincent, of University Park, Col., is the Superintendent of Instruction. Lectures will be delivered by Bishop J. H. Vincent, Chaplain McCabe and others.

BAY VIEW, MICHIGAN.

The Bay View summer university opens this year on July 12, the Assembly one week later, both closing on August 15. Mr. John M. Hall, of Flint, Mich., is at the head of the Bay View system, while President John M. Coulter, of Lake Forest University, is in charge of the summer university. The latter includes, besides the College, and School of Methods, schools in Music, Art, Oratory, Physical Culture, and a Bible School. The heads of these schools are: College, Pres. J. M. Coulter; School of Methods, Dr. R. G. Boone; Music, Mr. J. H. Hahn; Art, Mr. John H. Vanderpoel; Oratory, Prof. Byron W. King; Physical Culture, Miss L. E. Phoenix; Bible, Prof.

H. L. Willett. The faculty numbers 45 instructors and 109 courses are offered.

In addition to the usual courses, Elementary Science, under a successful teacher, will be a new feature this year.

Bay View has always taken just pride in its excellent equipment and trained instructors. There is a true university spirit in the institution.

The Assembly effectively supports the University, by providing courses of lectures of more than ordinary educational value and stimulus. Prof. H. H. Boyesen, of Columbia College, on German Literature; Mr. F. Hopkinson Smith, on Art; Mr. Louis C. Elson, on Music; Dr. A. J. F. Behrends, on the Bible, and others equally notable, are among the announcements for this year.

Completeness and a progressive spirit have given Bay View a front place among the summer schools of the country, and a patronage extending far beyond the bounds of the West.

MONONA LAKE ASSEMBLY.

Wisconsin's chief summer gathering is on the banks of Monona Lake, opposite the city of Madison. In the line of university extension work, Professor H. H. Boyesen, of New York, will give a course of five lectures on German Literature. Other courses of this kind will form a feature of this year's programme, which will occupy the ten days from July 24 to August 3.

A KANSAS CHAUTAUQUA.

The Ottawa Chautauqua Assembly will hold its eighteenth session at Ottawa, Kan., June 19 to 29. Dr. D. C. Milnor is President; Dr. J. L. Hurlbut, Superintendent of Instruction. Among the lecturers will be Bishop Vincent, Robert J. Burdette, Governor McKinley and Col. F. W. Parker. Among the new features of the Assembly will be a series of lectures, each at eleven o'clock, by the various college presidents of the State.

PUGET SOUND.

Out on our Northwest coast also they have developed the summer school idea, and the Puget Sound Chautauqua begins its annual session July 3. The school will be followed, July 25, by the Assembly proper, which will continue two weeks. John DeWitt Miller and the Rev. S. J. McPherson, D.D., of Chicago, will have places on the list of lecturers.

COLORADO.

The Colorado Summer School of Science, Philosophy and Languages will hold its third session during July, 1894, at Colorado Springs. This institution has the co-operation of the colleges of the State, as well as of the public school authorities. The faculty includes President Slocum, of Colorado College; B. E. Fernow, Chief of the Department of Forestry at Washington; Samuel Parsons, Chief of Parks Department, New York City, and many well-known teachers and college professors. Edwin G. Dexter, of Colorado Springs, is Director of the school.

OTHER SUMMER SCHOOLS.

The Cook County Summer Normal School, under the direction of Col. F. W. Parker; Martha's Vineyard Summer Institute, Cottage City, Mass.; the National Summer School of Methods, Science, Oratory and Literature, at Glens Falls, N. Y.; the Virginia Summer School of Methods, under the supervision of John E. Massey, the Richmond Superintendent of Schools, and the Normal Institute of Vocal Harmony, at Lexington, Mass., are among the institutions which we are compelled to pass without detailed notice.

SUMMER COURSES AT UNIVERSITIES.

SUMMER WORK AT HARVARD.

Harvard University announces courses during the summer of 1894 in English, Anglo-Saxon, German, French, history and art of teaching, psychology, geometry, trigonometry, engineering, physics, chemistry, botany, geology, and physical training. Women as well as men are admitted to most of these courses, which in general are adapted to the needs of those who intend to be teachers in the several subjects. Students will have the privileges of the library and other advantages connected with university residence. Courses in the Medical School will be open to men only.

THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

The summer schools of the Massachusetts Institute of Technology differ from the summer schools maintained by most colleges and technical schools in the respect that they are primarily and principally for the benefit of the students of the Institute itself, although other students may be admitted upon the payment of a moderate fee for the course. The students of the Institute receive instruction free of charge. The object of these schools is, therefore, to afford the students of the Institute opportunities for pursuing their studies further than they otherwise could, and especially for carrying on or inspecting field work or practical work in shops and foundries, in application and in exemplification of the principles studied during the regular terms of instruction.

The summer school of Mining in June, 1894, will be held at Eustis, Quebec, where an ore of copper, sulphur, and silver is mined. The students will camp out in tents. The mine affords an excellent opportunity for study in all four of the directions previously mentioned. The climate of the region at this season is delightful. It is a matter of great gratification to note how warmly the students are welcomed at the various works, and with what generosity the various departments are opened to them for study by the owners and managers of works and mines.

In the case of the Metallurgical summer school, some manufacturing centre is selected which presents a considerable variety of smelting and refining operations. The students divide their time between the different metals and processes. The notes taken are required to be carefully written up day by day.

A summer school of Topography, Geodesy and Geology is held during the month of June in the vacation following the third (Junior) year, and is open to all students who have completed the third year of the Civil Engineering Course, as well as to other students, from the Institute or elsewhere, who have had the requisite preliminary training. The instruction continues during four or five weeks, and is designed to supplement and extend the regular work of the term by furnishing the special field-training essential for students who desire to enter the government surveys, or to engage in any extended topographical or geodetic work.

THE SUMMER SCHOOL AT CORNELL UNIVERSITY.

The Cornell University summer school has now been more completely organized, and for the summer of 1894 instruction is offered in the following subjects: Greek, Sanskrit, Latin, German, French, Spanish, English, philosophy, pedagogy, political economy, mathematics, physics, chemistry, botany, geology, drawing and art, mechanical drawing and designing, architectural drawing, experimental engineering, physical training.

The school opens July 6 and continues six weeks. Courses beginning on the same date and continuing eight weeks are also offered in the School of Law.

The summer school is open to women as well as to men, and the same facilities for work are extended to these students as to regular students of the University. Without excluding others qualified to take up the work, these courses are offered for the special benefit of teachers and advanced students. Regularly matriculated students of the University may also obtain credit for work in the school under certain conditions. All are taught by University instructors and with access to University libraries, museums and laboratories.

Besides the courses, every opportunity will be given for original research, under the guidance and with the assistance of members of the instructing corps. For such research unusual facilities are offered by the large working library of the University and by the well equipped laboratories.

The city of Ithaca is easy of access, is delightfully situated in the beautiful lake country of central New York, and with its lake, hills and glens is an attractive place of summer residence.

THE UNIVERSITY OF MICHIGAN.

The summer term at Ann Arbor will extend from July 9 to August 17, and instruction will be given in Greek, Latin, French, German, English history, philosophy, science and art of teaching, political economy, mathematics, physics, chemistry, astronomy, animal biology, botany, and drawing. As at Harvard and Cornell, the work is especially adapted to the needs of teachers.

INDIANA.

Indiana University, at Bloomington, begins its fourth session of the summer school Tuesday, June 26, and closes on Friday, July 27. Thirty-three courses in all will be presented. These courses are in English history, philosophy, mathematics, physics, chemistry, botany, zoölogy and Latin. Latin and history are presented in the summer school for the first time this year. The students of the summer school consist largely of teachers of high schools, academies and colleges.

MINNESOTA.

The State of Minnesota grants \$20,000 a year for the support of summer schools for teachers; about fifty such schools are annually held in the counties of the State for the benefit of teachers of rural schools, and in connection with the State University, at Minneapolis, a school of more pretentious character is maintained for four weeks, beginning July 30. This school is organized in two sections—one of advanced work for the teachers of high schools, and the other offering elementary instruction in the common branches for teachers of all grades. Instruction in the first section is given by members of the University faculty, or under their supervision. Courses are offered in biology, languages, history and literature, with the use of the University laboratories and library. The attendance at both sections is expected to reach 600. The school will be conducted by D. L. Kiehle, Professor of Pedagogy in the University of Minnesota.

VIRGINIA.

The University of Virginia offers summer courses in chemistry, mathematics and medicine. The department of mathematics in this institution has conducted summer work for the past twenty years, thus anticipating most colleges in the summer school movement.

THE LATE DAVID DUDLEY FIELD.

REV. HENRY M. FIELD, D.D.

JUSTICE STEPHEN J. FIELD.

THE LATE CYRUS W. FIELD.

FOUR FAMOUS BROTHERS.

THE WORK OF DAVID DUDLEY FIELD.

BY AUSTIN ABBOTT.

FOR at least a third of a century David Dudley Field was the most commanding figure at the American bar. Tall, erect, stalwart, alert, and decided in movement, courteous and graceful in bearing, he impressed the observer at once as a man of marked gifts and force. This impression every advance in acquaintance deepened. Those who knew him intimately saw an imperious nature, equipped with great intellectual power, and restrained by an intuitive appreciation of the amenities of social life.

Other men at the bar have perhaps had a more profound knowledge of the technical details of law, but none have seen the law more truly in its immediate relation to public welfare. Other men have been more devoted to research and gathered richer stores of erudition to throw light upon the law, but few if any have known so well how to inspire others in research, or with such good judgment to select from its fruits that which was of prime importance to his purpose. There have been other men more given to close and sustained reasoning, but few able to put such a forceful personality into the presentation of legal reasoning. There have been other lawyers with more notable gifts of wit, humor, satire and invective, but few if any whose prepossessing presence and keen minded powers, in a personal controversy delivered harder blows or sharper thrusts, yet with so much respect for forensic and parliamentary proprieties. Others have been more eloquent to the popular appreciation, but few have had such a vigorous grasp of thought or such convincing power in forcing hesitating minds to a firm conclusion.

The public, however, are interested not only in the professional service of this remarkable man, but also in that greater service which he rendered to the profession, and through the profession to the country at large, in improving the law itself.

THE TASK OF LAW REFORM.

Notwithstanding all the badinage which is expended upon lawyers, the obvious truth is unobscured that the administration of justice has been built up by what they have done, and that its maintenance is due to them; and that all that the community enjoys of the security of law and the suppression of social violence and wrong, is owing to the success with which the bar and the bench in their professional functions maintain that justice which Daniel Webster well said "is the great interest of man upon earth." Mr. Field, in the midst of arduous duties of private practice and antagonisms into which he to a degree beyond most practitioners was occasionally drawn, labored persistently for about half a century and with large success to improve the condition of the law itself, and the procedure by which it is applied to the controversies of men.

At the time Mr. Field commenced his career as a law reformer many antiquated forms of procedure, handed down to us from the English law, had in the great advance in general intelligence and judicial ability become useless incumbrances to the prompt and inexpensive administration of justice. Most

DAVID DUDLEY FIELD.

of these are too technical in detail to interest the general reader, but one or two of the most important are so characteristic of the history of the law, and so important in their relation to the interests of the community, that the reader who will give his attention to some apparently dry details will, I trust, feel repaid.

COMMON LAW AND CHANCERY.

There had grown up in the mediæval history of the law of England two classes of judges, the Common Law and the Chancery. Volumes have been written on the origin of this distinction and the reasons for its perpetuation. For the present purpose it may be well characterized as the distinction between Routine

and Discretion. We see to-day essentially the same distinction between inflexible rules and a power to dispense with such rules in almost all organized arrangements that involve delegation of power. The reason that led the King and the English Parliament to support two distinct systems, one of Common-Law judges who were bound to follow the Law, another of Chancery with power to administer Equity beyond the Law, and even to restrain any particular person from enforcing the Law when injustice would result, was in its nature the same as that which leads a great railroad company to maintain in its principal passenger station a ticket office where the official has power to sell tickets but no discretion as to their use ; and upstairs an official who has no power to sell tickets but a discretion as to their use. If a ticket holder lets the day pass and desires to use his ticket on a later day than the date it bears, the ticket agent must refuse the application. His is the office of routine. He must enforce the contract. The applicant is sent thence to the superintendent upstairs, where he may state his case and find a discretionary power which can interfere with routine and redress the complaint. If a customer of a bank wishing to withdraw paper which he has left with the discount clerk, and which has been passed upon by the board, applies to the discount clerk to have it returned and the entry canceled, he will be turned away from that wicket ; he must make his application over again to the cashier or president or some officer with discretionary powers.

For the same reason the common-law judges were compelled by penalties and punishments, often inflicted upon them in early times, to adhere to the routine of the law and administer with all practicable uniformity "the laws and customs of England ;" and yet at the same time, appointed by and responsible to the same government, was the Court of Chancery, standing nearer to the King as the fountain of justice, and acting as his immediate representative, clothed with discretionary power to hear complaints that routine could not entertain, and to redress unusual grievances even to the extent of compelling one who was doing unjustly, in a case where there was no law, to make redress, and even to compel one who was using the routine of the law in an unconscionable manner, to cease. The details of procedure were all arranged to fit this double system. If a suitor prevailed at law, he was entitled absolutely to costs as matter of right. If a suitor prevailed in Chancery, it was in the discretion of the court to make him pay the costs as a condition of obtaining relief, or to impose costs on the defendant as if he had been sued at law. If the debtor concealed his property so that the sheriff could not enforce execution, Chancery could compel him to produce and surrender it. If a man preferred to break his contract rather than perform it, and the law only allowed damages as a redress, Chancery could compel him to perform it or go to prison, instead of allowing him to pay the legal price he preferred to pay for the liberty of refusal. And so on through the entire circuit of rights and duties which the conscience of statesmen recog-

nized outside of the old limits which the routine of common law had defined.

AN ILLUSTRATIVE CASE.

One or two instances out of thousands will illustrate the cumbersomeness of this procedure by two inconsistent systems as they existed when David Dudley Field was a young lawyer at the bar.

The Duke of Beaufort, about 1840, sued one Smith, a coal miner, to recover tolls or dues in the nature of royalty, which he claimed as payable to him upon coals which Smith had mined within the Duke's manor in Glamorgan and carried from the manor and

AS HE LOOKED THIRTY YEARS AGO.

sold and exported to sea over Swansea Bar. The claim of the Duke was that he was entitled to four pence for every wey (a certain measure of weight) of coal taken from these collieries and carried over his lands and exported over the Bar ; and he relied upon custom or immemorial usage as fixing the amount of

the toll or royalty. The defendant Smith put in a plea denying the claim, and one main question to be tried in the court of law in which the action was brought was the existence and the uniformity of the custom or usage fixing the tolls. The courts of common law had not been clothed with the delicate and easily abused power to compel a party to an action to testify or to disclose to his adversary his own private books and papers for the purpose of enabling his adversary to prevail against him. This power had been exercised only by the King through the Court of Chancery. Smith therefore addressed a bill of complaint to the Chancellor stating the facts in regard to the action at law that had been brought against him, and alleging that there had been from time to time in previous generations, variance in the rates of toll charged by the Duke and his predecessors in title, and therefore no uniform custom existed ; and that, moreover, the rate of toll had at times, or in some respects, been fixed by contract, differently from any usage. On filing such a bill, the complainant could have an injunction against his adversary prosecuting the suit at law any further until answer to the bill in Chancery had been heard. The bill further stated that numerous documents which substantiated the complainant's defense were in the Duke's possession, such as the audit rolls of the manor from the time of Henry VIII, accounts for more than one hundred years past, and letters relating to the business at various times during the century past, and several ancient surveys of the manor.

The Duke's suit at law being therefore suspended until after he should answer in Chancery, he put in an answer admitting the possession of the documents and admitting also that there were variances in the tolls, but he claimed that Smith had no right to examine his books and papers. After a long discussion before Sir James Wigram, the Vice-Chancellor, and on appeal before Lord Lyndhurst, as to the principles by which equity should be guided in compelling a disclosure of such papers, the relief which the coal miner sought for was granted in part, and a number of the documents above mentioned the Duke was ordered to produce and submit to examination by the coal miner's counsel. Ever since that time the conclusions reached by Chancery in this case have been part of the instruction of the bar and the guidance of other courts in controversies over the right to explore an adversary's books and papers. The archives of the manor having thus been reached by the coal miner, the action at law was at last after the lapse of seven years brought on for trial and determination. Extracts from the documents of which Smith had obtained the contents were laid before the court of law ; but after all this long contest the Duke recovered judgment.

ANOMALIES STILL REMAINING.

When our American governments were established a Supreme Court (being a court of common law only) and a Court of Chancery were founded in New York upon the English system, and the same complex double procedure continued down to 1846. In the

formation of our federal government powers of the common law courts and powers of a Court of Chancery were both conferred upon the United States Circuit Court, but to be separately exercised by the same judge, sitting in the same court room, and he was, therefore, bound by the old rules of routine law in one class of cases, but clothed with the discretionary powers of a chancellor whenever those were invoked by a bill of complaint addressed to him as if he were a chancellor.

Let us take another instance of this complex duplicity of procedure which occurred very recently in one of these federal courts to which Mr. Field's reform has not yet penetrated. Erhardt sued Boaro to recover possession of a mining claim in Colorado which Erhardt claimed belonged to himself, and from which he complained Boaro and his fellow defendants had ousted him. He alleged that they had removed large quantities of ore from the mine ; and he claimed possession of the mine and damages for what ore they had wrongfully taken. The defendants put in an answer in which they denied plaintiff's claim, and asserted themselves to be the true owners of the mine. The routine of common law had always authorized a claimant of land who had been ousted to recover possession on proving his own title : but the judges of common law had not been clothed with discretionary power to control the use of the land during the pendency of the action. The theory of the law in this, as in other classes of cases, was that absolutely fixed and settled rules such as those of the common law could not well determine such a question as the temporary use pending the suit where the right must largely depend upon the apparent or probable merits of the claim, the good faith of the parties, the pecuniary responsibility of the one in possession, and other considerations of like prudential character ; and as the judge of the Federal Court, holding his court as one of common law, could do nothing in regard to the premises until final judgment had been reached and the marshal directed to give possession, Erhardt, the claimant of the mine, presented a bill of complaint to the same judge sitting as a chancellor, stating that he had brought a suit at law, and setting forth the facts to substantiate his right to recover, and further stating that notwithstanding the bringing of the suit Boaro and his companions were persisting in working the mine and were going on to take large quantities of ore from it ; and he prayed the judge to issue an injunction to forbid their removing any more ore until the final determination of the action to recover possession of the mine. And upon this application, supported by affidavits, the judge in his capacity as chancellor, granted an injunction. This stopped the further prosecution of the mining for the time being ; and thereafter Erhardt brought his suit at law to trial before the judge holding court as a court of law. He failed at the trial to establish his case. The jury rendered a verdict for the defendants Boaro and others. They then applied in the equity suit, and the judge sitting as chancellor, on proof of the fact that the plaintiff

at law had failed and defendants had recovered judgment, dissolved the injunction, thereby allowing the defendants to go on with their mining. The plaintiff being advised that justice had not been done him upon the trial of his action for possession, took a writ of error to the Supreme Court of the United States to review the judgment against him in the ejectment suit, and he also took a parallel appeal to the same court from the order dissolving the injunction. Both causes were brought on together, and the Supreme Court of the United States, being of opinion that the defendants had not established a sufficient defense, ordered a new trial as to the right of possession and damages in the action at law. They then took up the appeal in the suit in equity, and held that as the verdict which had secured the dissolution of the injunction had now been set aside and a new trial ordered, the controversy was reinstated to the situation in which it was after the injunction had been granted and before the cause at law had been tried, and they, therefore, reversed the order dissolving the injunction and reinstated the injunction. We have not heard which party finally prevailed.

This is only one of innumerable instances where, by reason of the persistence of the old procedure long after the cause which originated it ceased, a second suit in equity is often made to dance attendance upon a suit at law when one proceeding would be more effective, more convenient and cheaper. Mr. Field proposed that the judge having the common law jurisdiction be vested with the powers of a chancellor, and might exercise them in a common law case in the simple manner of an order on motion on a few days' notice.

NEEDLESS COMPLEXITIES TO BE DISCARDED.

There were other artificial distinctions in procedure besides this duplex system of courts, which had become similarly cumbrous and unnecessary.

The professional reader and perhaps some others may be interested in a few words relating to the chief of these.

It is a principal function of the lawyer to know in what cases an action will lie to redress a wrong, and in what cases it will not; and in the effort to systematize our knowledge upon such a question it is necessary, as it is in every branch of science, to deal with classes of cases, and perceive by a process of generalization what are the elements essential to each class. Of course as the complexity of human relations and transactions giving rise to controversy increased, the classes of cases might be expected to increase. This process of classification of rights of action came very early to be of great importance in the administration of justice, because the writ to be issued to bring the defendant before the court was required to state or at least indicate to him what kind of an action he would have to respond to, whether an action to compel him to pay a debt, or to pay damages for breaking a covenant, or to answer for a trespass to land, or a trespass on the person or on personal prop-

erty, and also in case of trespass whether it was a direct trespass by force, or a matter of negligence, and the like.

Some centuries ago, after the clerks of court had by issuing successive writs in a great many cases developed a considerable number of classes of cases, Parliament, thinking to check the growth of litigation, interposed and forbade the invention of new writs, and allowed them to be issued only in such cases as those in which they had been previously issued, or in like cases. The ingenuity of the bar and of the clerks of court was thereafter exercised with some effect in devising writs for new cases which were not too different from anything previously known to be called "like cases," but the result of this legislation was to crystallize pre-existing forms, to emphasize the necessity that each new action should be described as within some pre-existing class. Another effect was to increase vastly the number of applications to the chancellor by bills of complaint to get redress in new kinds of grievance where there was no adequate remedy at law, because no allowable writ. The ingenuity of men in doing injustice in new forms went on developing, but Parliament had put a check on the ingenuity of the common lawyers to devise corresponding writs.

This intervention of the legislative power thus had, in course of time, these two great effects, both probably unanticipated: 1, The arrest of the development of the full adaptation of common law to the needs of society, and, 2, the acceleration of the development of a more discreet and equitable system of justice through resort to Chancery.

The question at once occurs to the progressive minded reader of the present day, how could an arrangement ideally so absurd as two systems of courts and of law for the same people and the same controversies hold its place for centuries as the means for administering civil justice among so practical people as the English and the Americans?

Two reasons may be suggested to the reflective reader as we pass this interesting question: 1, The lack of men in the profession fitted to master and administer both kinds of law; and 2, the reluctance of lawyers who feel proper responsibility for the interests of clients to accept a new and untried system in place of that which is settled and to which all their clients' affairs have been adjusted. The first of these hindrances perpetuated the double judicial system long after the causes of the division ceased. Just as there are men in the profession admirably fitted by temperament or training or both to serve as advocates, but not to serve as judges, and others sure of success and usefulness as judges and of failure as advocates, so there have been many excellently equipped for the common law bar or bench, but poor material for chancellors and solicitors. Whether this has been for lack of training I will not undertake to say; but the profession, even since the merger of the two systems, are every day observers of the fact that some judges give better satisfaction to the sense of justice of the bar while sitting with a

jury in actions for debt or damages, and others uniformly give better satisfaction while sitting to determine according to an equitable discretion controversies which inflexible rules are not so well adapted to settle. Whatever we may think of the cause of the long persistence of this antiquated division of judicial labor, we need not be surprised that the Americans should become ready to abolish it before the English did, nor that among Americans the great State of New York, where enterprise and conservatism combine in the strongest forms for safe progress, should be the jurisdiction in which the experiment was tried.

THE CODE OF PROCEDURE.

Mr. Field was admitted to the New York bar in 1828. He devoted himself to the thorough study of the practice both in the common-law courts and in Chancery. His method of dealing with procedure in his subsequent Code, shows that his antagonism to the old systems did not spring from ignorance of them but from a complete mastery of both, a just appreciation of the best features of each, and a comparison of them with procedure in other States, especially Massachusetts, which had no Chancery, and with continental European systems founded on the civil law. To this technical knowledge of existing methods was joined a statesmanlike appreciation of the real function of litigation in superseding private controversy, and of the consequent necessity that remedial justice should be expeditious, simple and inexpensive.

The then existing system was imbedded beyond legislative power in the constitution of 1821. Mr. Field commenced in 1839 to agitate the subject of reform. Five years afterward the constitutional convention was held, which formulated the provisions that cleared the way for the reform that Mr. Field desired to carry out. The majority of the Judiciary Committee reported a plan embodying Mr. Field's suggestion of a single court having general jurisdiction both in law and equity. Charles O'Connor, the leading member of the convention from the New York bar, proposed a plan different in detail, but if anything more radical than Mr. Field's in this respect, for his proposal did not mention law and equity as if different functions vested in the same court, but simply declared the "judicial power of the State" to be vested in the one court, subject to appeal.

Mr. Field was not a member of the convention, but was active in suggesting and advocating the change, and his memorial to the succeeding legislature led to the appointment of a commission to prepare an act to simplify the procedure. It is said that he was not at first appointed on this commission because he was regarded as too radical, but upon the occurrence of the first vacancy the legislature appointed him in place of the retiring member, and he immediately devoted himself to the practical part of the task he had undertaken.

The genius of Bentham, who had given years of time and volumes of writing to criticising and satirizing English legal institutions, may fairly be said to

have been only destructive. The mediæval absurdities which lingered in the "perfection of human reason" he dissected with great skill and power; but his suggestions as to details of what ought to be in place of what was, have never to any considerable degree commended themselves to men concerned with maintaining practical justice. Mr. Field's genius was essentially constructive. He conceived the simple, well proportioned system that the country needed, and his attack on what was, he carried on simply to make way among the old law for the introduction of the new.

The foundation of the new structure was laid in the declaration that the Supreme Court has general jurisdiction in law and in equity, and that all the forms of action heretofore existing are abolished.

The main pillars of the superstructure were the following regulations:

1. Pleadings are to state facts, and state them truthfully, as it is proposed to prove them on the trial.

2. Equitable defenses and counter claims are available in all actions, so that one who formerly had to bring a new suit in Chancery to enjoin an inequitable use of process at law could now state his objection as a defense to the action brought against him.

3. The power exercised by the chancellor in equity suits to compel parties to testify and to produce their books and papers was conferred on the court for all actions.

4. If the evidence at the trial (which now must be taken there openly in all actions, instead of the secret method of *ex parte* examinations allowed in equity) varies from the pleading, the action should be dismissed only where it made a different case (for then the adverse party could fairly say that he had not received fair warning of what facts he was to try); and that any variance short of that might be either disregarded or be cured by amending the pleading, according to the seriousness of the discrepancy, and that the court might allow amendment to supply an omitted allegation.

The Code of Procedure embodying these principles and carrying them out by readjusting the mechanism of an action accordingly, made in the form first adopted a statute of 371 sections, filling less than seventy pages.

Then ensued a contest between the conservatives and fossils of the bar on the one hand and the progressives and young men on the other which lasted for years. Before the objurgations against the new procedure died out the Code had been adopted in some twenty-four States and Territories, and in other apparently conservative States where the name of Code is not spoken, these four leading principles have been adopted in statutes designated as Practice Acts, etc.; and in some of these instances the terse, vigorous and untechnical language in which Mr. Field expressed them is copied word for word. The extent of the adoption of the Code as such does not measure the influence of his work. It is not too much to say that with a few local and unimportant exceptions the main

features of the New Procedure have been accepted throughout the country and have been accepted in other respects even where the distinctive tribunals and the contrast between suits at law and in equity survive.

THE CODES OF SUBSTANTIVE LAW.

Mr. Field's reform of judicial organization and procedure was only the first step in a scheme of general improvement in both the form and substance of the law. His conception was noble in its breadth and simplicity, admirable in its clearness. Its feasibility, or the usefulness of any practicable execution of it, is the great question which divides professional opinion to-day.

His conception was, - all law reduced to the form of a statute, so that a man could carry in his hand the printed record of all that the State ordained for the regulation of human conduct.

The basis of his arrangement of the law was: 1, a *Political Code*, to contain all that part of the law which public officers and citizens having to do with public officers need to know; 2, a *Civil Code*, to contain all of the law that members of the community need to know in regard to their civil rights, duties and responsibilities in respect both to personal relations, property, and obligations; 3, a *Code of Procedure* (already spoken of), which should contain all of the law that courts and lawyers engaged in the administration of civil remedies need; 4, a *Code of Criminal Procedure* for the courts and bar engaged in criminal cases, and, 5, a *Penal Code*, to contain the law of crimes and the corresponding punishments.

The success and the finally conceded usefulness of the Code of Procedure led to the adoption after some years of the Code of Criminal Procedure and the Penal Code. The great contest not yet concluded has been waged over the Civil Code. The ablest, most experienced, most learned and most fit experts in the profession are divided in opinion both as to the desirableness of reducing the law to the form of a statute, and as to the success of this particular effort in that direction.

It appears to me probable that the Civil Code would long since have been adopted in the State of New York, as it already has been in several other States, were it not for two reasons, which, if I am not mistaken, have thus far turned the scale against it.

In the first place it contains many new provisions changing the existing law.

Another cause of the delay to adopt the Code I think may be seen in the general want of confidence in legislation as compared with the work of the courts. If our legislators were as faithful in their public services as our judges, the community would be more ready to accept at their hands a body of law reduced to the form of a statute. But such a Code the legislature would be likely to amend every year, as

they do other work of their own, according to the pressure brought to bear upon them; and the distrust of the legislative power which recent times have aroused has been very unfavorable to the progress of codification.

THE INTERNATIONAL CODE.

This is the crowning work of Mr. Field's life. Here, with an energy and industry which left all the other members of the committee behind, he formulated the great principles of the external policy of nations in their relations with each other, in a clear and systematic arrangement. This statement of international law embodies all the rules of general acceptance found in the writings of jurists whose authority is recognized at the present day, and it includes also a codification of all the conventional provisions common to many treaties between different nations, now in force; so that it may be truly said to embody a consensus of opinion on the whole field of the law between nations. Its close adaptation to existing law has made it already an accepted authority often cited by writers on international law, although it has not yet received governmental adoption.

MR. FIELD'S CONCEPTION OF THE LAW.

The admirable qualifications of Mr. Field for the great task which he accomplished would not have been complete without his advanced conception of the law itself. He was not a "case lawyer." He appeared to survey law in the direct relation which the whole and each part bears to public welfare. Without discussing the metaphysics of the subject, he seemed to regard the law as a system of partly developed principles; a few of which are familiar to all intelligent men; some of which have been through long discussion reduced to clear and concise statement capable of being understood by all intelligent men; and others of which are yet involved in uncertainty and controversial discussion, but which he held must be reduced to the same form. He dealt with the law as a system of principles. I cannot remember in our conferences a single instance in which he mentioned a case as an authority, save in consultations in which he was simply preparing to argue a cause in court. Conflict and confusion in authority were no obstacle. He wished to know if they existed, to take the measure of the doubt, and to clear it up by a statement of the principle. His labors in codification were in the knowledge of the relative value and place of great principles, the discernment of certainty in the midst of others' doubt or dissension, the organizing faculty which saw these principles in a scientific relation and expressed them systematically as a harmonious whole.

His work will never be forgotten, because it forms a conspicuous part of the progress of man himself toward that intelligent regulation of life which is the object of all law.

LOUIS KOSSUTH: A CHARACTER SKETCH.

A race of nobles may die out,
A royal line may leave no heir ;
Wise nature sets no guards about
Her pewter plate and wo den ware.

But they fail not, the kinglier breed
Who starry diadems attain ;
To dungeon, axe and stake succeed,
Heirs of the old historic strain.

The zeal of Nature never cools,
Nor is she thwarted of her ends ;
When gapped and dulled her cheaper tools,
Then she a saint and prophet spends.

Land of the Magyars, though it be
The tyrant may relink his chain,
Already thine the victory,
As the just Fortune measures gain.

Thou hast succeeded, thou hast won,
The deathly travail's amplest worth ;
A nation's duty thou hast done ;
Giving a hero to this earth

And he, let come what will of woe,
Hath saved the land he strove to save ;
No Cossack hordes, no traitor's blow,
Can quench the voice shall haunt his grave.

"I Kossuth am : O Fortune, thou
That clear'st the just and blott'st the vile,
Over this small dust in reverence bow,
Remembering that I was erewhile.

"I was the chosen trump where through
Our God sent forth awakening breath ;
Came chains, came death ? The strain he blew
Sounds on, outliving chains and death."

J. RUSSELL LOWELL.

LAST month, when Louis Kossuth died, there passed away the last link which connected us of this generation with the great ones of the midcentury Revolution. One by one all the stars have fallen from the galaxy, and now there is not one left of all those famous heroes whose exploits were the inspiration of our boyhood. Mazzini, Garibaldi, Herzen, Ledru Rollin, Louis Blanc, Victor Hugo, Kossuth, all are gone. "The kinglier breed who starry diadems attain" have departed, leaving but the memory of their deeds to glorify their dust. It is an evil thing for Europe that so few of its leading statesmen have passed through the crucible of persecution and proscription. In these piping times of peace and comfort it is rare to come upon a man of the front rank who has experienced the hardship of prison fare, or who, face to face with death, has had to choose to sacrifice life if need be rather than betray the cause. Here was a remnant of such left us from the great midcentury uprising, but Kossuth was the last of them. He had long outlived his time, and when, worn, weary and disheartened, the old man of ninety was gathered to his dead, those who loved him best must have felt some sense of relief. For to him the world was out of joint, and although he was not born to set it right, no one else seemed to him destined to play the great rôle and save Europe from its doom.

He was a melancholy illustration of Byron's familiar lines :

"The ruined wall
Stands when its wind-worn battlements are gone ;
The bars survive the captive they enthal ;
The day drags through, though storms keep out the sun ;
And thus the heart will break, yet brokenly live on."

Kossuth's heart was broken long ago. But it was only the other day that it ceased to beat, and its casket could be laid to rest in the land from which

for nearly half a century he had been an exile. Kossuth is still a name to conjure with in the American Republic, where he is one of the few Old World heroes who loom sufficiently large on the Eastern horizon to be visible across the heaving restless waves of the Atlantic. To Englishmen he is less of a notable. They are nearer the Continent, and the multitudinous troupe of contemporary mediocrities obscures the fame of the illustrious dead. Kossuth also—to Americans—was a pure idealist—the most eloquent of living men pleading the most sublime of all causes. He did not interfere in the national life of America. His dithyrambs never fired American cannon. His eloquence never cost an American life. Englishmen were not so fortunate. Kossuth's oratory was one of the contributing causes to the national madness which rendered possible the Crimean war. But for his pilgrimage of passion and the resulting enthusiasm for the Turk which had given the eminent fugitive shelter and protection, it is possible, so evenly poised are the scales of Fate, that the thousands of England's nameless dead who sleep before the gates of the Crimean fortress which they took but could not keep, would have found graves undarkened by the shadow of that international crime. Nor can Englishmen forget that when once more the issues of peace and war trembled in the balance in 1877, Louis Kossuth broke his long silence in order to plead with all his old passionate fervor for a policy which would have involved Europe in war. His paper in the *Contemporary Review*—in which, to quote his own phrase, he predicted "like a death prophesying bard" the doom of Austria, of Hungary, and indeed of civilization if Russia were allowed to make mince-meat of the Ottoman Empire—might have done mischief if England had not fortunately emerged from the glamour of the Hungarian's eloquence and refused to regard the butchers of Batak as the Heaven-appointed

custodians of the liberties of Europe. But peace be to his ashes! He loved his country well enough to be willing to sacrifice all other nations to her welfare as he understood it.

I. EDITOR.

The century which now has but six years to run was but in its second year when Louis Kossuth was born. He was the son of a lawyer who owned a small vineyard and boasted an ancient lineage. Turbulence, treason, or patriotism—which you will—was its distinguishing characteristic. Seventeen of its members were prosecuted for high treason by the Austrian Government in the 188 years intervening between 1527 and 1715. The law of heredity is strong, and Louis Kossuth, who said, "My genealogical tree is like a gallows, there is an ancestor hanging from every branch," nobly kept up the family tradition. The father was stern and inflexible, although devoted to his children. His mother, to whom his education was confided, was gentle and tender, but possessed an intellect of the highest order. Louis was a blend of both, but it would have been well for both himself and his country had he had less of the stern uncompromising rigidity of his father.

"THE CHILD IS FATHER OF THE MAN."

When a mere child he showed the temper of the exile who refused to return to Hungary when all his countrymen were ready to receive him as a national hero. His father, believing mistakenly that his son had disobeyed a trivial order as to a game at school, punished him severely and sent him home in disgrace. His mother, missing him at dinner and supper, sent for him, assuring him of his father's forgiveness if he would ask for pardon. "I would rather die of starvation," said the child, "than ask forgiveness for a fault I never committed." His father owned his mistake and the boy was received into favor. If he was inflexible where his ideas of right and wrong were concerned, he was as tender-hearted as his mother in helping the suffering. Like St. Martin, he gave away his cloak to a shivering comrade, and he was constantly in request when themes had to be composed by his less capable or more indolent school-fellows.

HIS EDUCATION.

He was of Protestant family, but apparently without very well defined theological sympathies. The first part of his university studies was spent in a Calvinist college, the second in a Lutheran. Whether Lutheran or Calvinist, he was always a Protestant; and although he married a Catholic wife, it was she, not he, who had to waive points of difference. His real religion was not Christian, it was Hungarian. He was first and foremost a Magyar, and no Church counted with him before his country. The heroic history of the Magyars, and the checkered but romantic annals of their struggle for the right to exist through the centuries, early fired his brain and filled his heart full of vague longings after political

independence. His romantic political idealism, however, did not stand in the way of his legal studies, and by the time he was twenty-one he had achieved such a reputation that his own father usually waived his own opinions in favor of those of his gifted son. On attaining his majority he took his seat as a noble in the County Meeting of Zemplin, and his eloquence and skill soon led to his appointment as steward of the great estates of the Countess Szapary, a post which he occupied with credit to himself and profit to the Countess for several years. The story that she accused him of embezzlement is a calumny. He staked and lost at play a few pounds of the Countess' money, which he immediately refunded, but he explained the incident to her satisfaction, and it caused no breach between them.

CARD-PLAYING AND BEAR-HUNTING.

Kossuth in his youth was passionately fond of play and of sport. But from both these master passions he was saved as suddenly as John Bunyan from the trick of profane swearing and the luxury of bell-ringing. When he was elected delegate for the Countess in the Diet of 1832, his mother bade him farewell with forebodings. "My son," she said, "your propensity for play makes me tremble lest you should yield to its temptations, as such a vice in you would make me miserable." He gave her a solemn promise there and then that he would never again play for money, and he kept his word. He was weaned from sport as suddenly. He was particularly fond of bear hunting, but one day when reading Firdusi, he was so much impressed by a passage in which the Persian poet appeals to man not to injure the lives of those who have as good a right to live as he, that he forswore hunting once for all. Wonderful the influence of the written word! Firdusi died in the thirteenth century, and six hundred years after his place knew him no more a passage in his writings saved the lives of bears in the Carpathian Mountains, and probably gave a new turn to the course of Hungarian history.

HIS FIRST EXPLOIT.

Another influence of a more modern kind came into his life about this time. In 1831 the Poles rebelled against Russia, and being crushed, the patriots fled into Hungary. Kossuth's mother was one of the many nobles who sheltered the proscribed refugees. It was the first overt act against the Austrian Government to which he had been a party, for Austria was hand in glove with Russia, and to shelter the refugees was expressly forbidden by the Government of Vienna. Another notable deed of these early days was his spirited defense of the Countess Szapary against the insurgent peasants, who, maddened by the cholera panic, declared the nobles had poisoned the wells, and rose in rebellion against the landlords. Kossuth, by the magic of his eloquence, saved the country from anarchy, while his heroic indifference to fear of contagion checked the disease and established for himself the beginning of that reputation

which he afterward turned to such good political account.

THE LAND QUESTION IN HUNGARY.

England was passing her first Reform act when Louis Kossuth, at the age of thirty, was entering the Diet as a young and comparatively unknown member of the Reform party. Hungary at that time stood badly in need of reform, not so much of deliverance from the Austrian yoke as of release from the domination of the Magyar nobles. Of the 13,000,000 of inhabitants then living in Hungary, 11,000,000 were peasants, who were forbidden by law to own the land which they tilled, while they were saddled with almost all the cost of local and general government. They were unprivileged and without representation in the Diet, but under Maria Theresa they had obtained certain rights on their land from which they were not to be dispossessed, except in case of crime or of failure to comply with the conditions of their tenure. These included, among other things, the duty of rendering labor for their lord from eighteen to 104 days per annum, according to the number of their acres, and one-ninth the produce of their holding. The great question when Kossuth entered the Diet was the claim of the peasants to redeem their dues and become holders of their own freeholds. Thirteen times the Second Chamber of Magnates vetoed this demand, which had been as often approved enthusiastically by the House of Deputies. The Magnates were supported by the Emperor, and the Reformers were confronted by the combined forces of the Hungarian Magnates and the Austrian Government.

KOSSUTH'S FIRST NEWSPAPER: ORGAN OF THE DIET.

Kossuth, as a young man without a vote, was heard but little in the Diet. He achieved a much greater success as an editor than as a Deputy. He published a lithographed newspaper entitled the *Parliamentary Messenger*, which reported the action of the Diet. He wrote this originally as a British Premier writes reports of proceedings in Parliament for the Queen, as a private letter to the Count Hunyady, who was one of those landlords who formed his constituency. The Count, pleased with this letter from the Diet, which seems to have been something like Jos Cowen's London Letter when he was in Parliament, suggested that it should be lithographed and circulated throughout the country. The Austrian government, which had forbidden the publication of the debates of the Diet, declared this lithographed letter an infraction of the law. Thereupon the lithographic machine was abandoned and a large staff of clerks employed to make manuscript copies. These were seized at the post office. Nothing daunted, Kossuth hired special messengers, and an edition of 1,000 copies was circulated in all parts of the country. The *Orzaggyicseli Tudósítások*, Kossuth's Presburg letter, became the sounding board whereby the eloquence of Deak and other famous Hungarian leaders became audible in

every market place, and when the government dissolved the Diet in 1836, the Austrian and the oligarch were dimly conscious that there was a new spirit abroad in the land, and that it had been evoked by the newspaper of Kossuth.

HIS SECOND: ORGAN OF THE COUNTY COUNCILS.

When the Diet was dissolved the Austrian government resorted to the familiar old methods of repression. All the liberties were attacked in turn—liberty of press, liberty of speech, liberty of association. When the latter was threatened by the arrest of the young men of Presburg Casino, the country woke up, all the county councils, as we should call them, passed resolutions protesting against the outrage. But the Diet was not sitting, and the scattered county councils had no center. Kossuth saw the need and supplied the demand. Like Garrison, "he had a dauntless spirit and a press," or in place of a press a staff of secretaries who enabled him to produce a weekly newspaper which became at once the center and only organ of the county councils of Hungary. He had correspondents in each of the fifty-two county councils, and from their reports he constructed every week a newspaper, *The Messenger of the Municipal Bodies*, which from the Austrian point of view was as pernicious as the Presburg Letter in which he reported the proceedings of the Diet. The paper was read aloud every Sunday by the village notary to hundreds of attentive listeners, and nearly every county council filed it in their archives. The Viennese government, baffled and furious, resorted to the usual argument of tyrants. Unable to answer its intrepid assailant, it accused him of treason, arrested him by a company of grenadiers, and clapped him into the dungeon of the fortress of Buda.

CAST INTO PRISON.

This imprisonment was the making of Kossuth. It was hard to bear, for he spent two years in total solitude. During this period he was forbidden to see his friends, denied the use of a pen, and was not allowed any books. In his dungeon he had time to think, which was more than the busy editor had had for years past. Two years' meditation in a solitary cell is a liberal allowance, but Kossuth profited by it. Speaking of this period, he said, "It was two years of life lost, but it was all my life gained." After lying two years without trial, he was sentenced to four years' imprisonment in a fortress. After this time the severity of his imprisonment was greatly relaxed. He was allowed to study. According to a legend he was only allowed the use of one book, which is variously represented as having been Shakespeare or the English Bible. In reality he was put on no such short commons; but he spent his time studying English by the aid of Shakespeare, the Bible, and Walker's Dictionary. He filled up the rest of his time with the study of mathematics. The marvelous mastery of the English language, which enabled him to address great

mass meetings in England and America, dates from his incarceration in the fortress of Buda.

LIBERATED.

When he was lying in jail the popular agitation grew more and more stormy, and the county councils unanimously decided that nothing should be done until Kossuth and his companions were released. Austria was then in need both of money and of men, and it was necessary to conciliate the Diet. Therefore an amnesty was proclaimed and the peasant dues were abolished. The Diet in return voted 4,000,000 florins and recruits, and was immediately dissolved. Kossuth was ill when he came out of jail, but he speedily recovered and married a Catholic, the daughter of a noble who had taken a leading part in the popular movement. Next year, 1841, he returned to journalism, and published the *Pesti Hirlap*, or the *Pesth Journal*. This was the third editorial venture of Kossuth and the most successful of all three.

HIS THIRD PAPER: ORGAN OF THE NATION.

He made the journal the organ of the national movement. He advocated equally agrarian and civic reform, at the same time that he maintained an energetic protest against the Austrian despotism. There were plenty of abuses in the country to occupy his attention. He posed always as the non-revolutionary reformer, and always appealed to the aristocracy to take their natural position as the leaders of the people. "Let them," he said, "who carry the white banner of rational progress, crowned with the green garland of hope, vindicate the right of national prosperity and constitutional progress, and the nation will hail them with confidence as their leaders. But," he continued, "if you should spend your lives in inaction or set up your personal prejudice or private interest in the way of right and justice, and of the national commonwealth, the nation, unaided by you, will fulfill its own destiny. With you, by you, for you, or without you, even against you, if it must be." For four years Kossuth kept up a vigorous agitation in favor of reform, but in 1844 the government succeeded in separating him from his paper. The proprietor of the *Hirlap* wanted to make his way in Viennese society. An invitation to a court ball and a hint of further favors to come, was enough cause to induce him to break with his editor. This is the way with proprietors both in the Old World and New, and having been bought, M. Landauer, the proprietor in question, "stayed bought" in return for value received. He got up a quarrel with Kossuth and accepted his resignation. Kossuth was the more ready to resign because he had received a hint that he might receive a license to start a new paper. No sooner had he resigned, however, than the promised favor was denied him.

AGITATOR AND ORGANIZER.

He quitted the editorial chair only to take up the agitation by the formation of associations or companies for the promotion of Hungarian commerce. He started savings banks and promoted Hungarian trade

with foreign nations, and agitated for the extension of the railroad to Fiume. He was a member of the County Council of Pesth, and from his place in the council was able to address the whole of Hungary. In these various enterprises he expended a good deal of his own means, but he resolutely refused to accept the offer of an estate which was pressed upon him by Count Batthiany and other liberal magnates, in recognition of his services to the people. As years brought him nearer to the revolutionary overturn which was still hidden in the future, unseen even when it was close at hand, Kossuth had established a firm hold upon his countrymen. As journalist, as member of the Diet and as philanthropist, he had shown that he was a man of affairs well versed in all that concerned the interests of Hungary, passionately devoted to Hungarian independence, and, at the same time, what we should now call a semi-Socialist, who largely shared Lord Rosebery's views as to the duty of the State in relation to the condition of the people. There were great arrears to be made up. The peasantry were not half emancipated. Half a million nobles occupied positions of privilege which enabled them to lord it over the masses of the people, and the national rights of Hungary were practically at the mercy of the Austrian Ministry. Kossuth, besides having a good cause, was the possessor of a magic eloquence, by which he was able to sway the masses of his countrymen as the ripe corn is swayed by the summer wind. Thus equipped and thus prepared, Kossuth approached, all unknowing, the great crisis of his life.

II. DICTATOR.

It is idle to attempt to give, even in the most imperfect outline, any sketch of the stormy period in which Kossuth stamped his individuality upon the memory of man. To adequately portray the part which he played in the great revolutionary drama it would be necessary to tell the whole history of the Hungarian struggle for Home Rule. For Kossuth was always in those early days a Home Ruler, and a constitutional Home Ruler. Nothing was further from his ideal than an ultra-Republican crusade. The man was by nature conservative. He clung tenaciously to the ancient ways. He refused to utter the word republic even after he had declared Hungarian independence. So far was he from regarding himself as a champion of the universal revolution that he sanctioned the employment of the Hungarian troops to suppress the Italians who were struggling to free themselves from the Austrian yoke, and in the last spasm of the national movement he actually proposed to place Hungary under a Russian Grand Duke in order to avoid the hated alternative of submission to the Austrian Hapsburg. It was only when a long and bitter experience proved that there was no confidence to be placed in the Emperor and his advisers, and that perjury and perfidy were the habitual weapons of the Hapsburg in dealing with the Magyar, that he consented to draw the sword against Austria. He

was as reluctant to break with Vienna as Cromwell was to behead Charles Stuart. But in both cases the bad faith of the sovereign left the popular leaders no alternative.

THE BEGINNINGS OF THE REVOLUTION.

The earlier months of the great revolutionary year 1848 found Kossuth without any official position, but the virtual chief of the Magyars. His eloquence, the memory of his sufferings and his immense ability gave him a position far superior to that of the nominal Ministers or of the official representative of the

KOSSUTH IN 1849.

Emperor-King. It was a time of great ferment. The established governments, at their wit's end for money, were confronted everywhere by populations hungering and thirsting for liberty. The populace rose in Vienna. Metternich fled. The Magyars fraternized with the inhabitants of the Austrian capital. Kossuth and the Reformers at the Diet of Presburg had carried a series of reforms which they wished the Emperor-King to ratify. Kossuth was one of the deputation which waited upon Ferdinand. He was received in the city with popular demonstrations of enthusiasm as the deliverer of his country.

KOSSUTH'S INTERVIEW WITH THE EMPEROR.

How he was received at the court he described in one of the first speeches he made in England :

We established a responsible Ministry, ordained that the

nobles should participate with the peasantry in all public duties, and that all should have the franchise both for members of Parliament and for the county meetings. These laws were brought by a deputation headed by the Archduke Palatine, up to Vienna. He asked, in the name of the future of Hungary, and of the peace of Austria, that these terms should be granted. We were ordered to bring our claims before the Emperor of Austria, and also to ask him to give to our fettered brethren of Austria our rights. The government hesitated to concede these just claims. I went myself to the Imperial Palace and told the Emperor that if he persisted, I could not guarantee what would be the consequence, with these movements in Europe, and when the people of Hungary saw their just claims resisted. They told me the claims would be conceded if Vienna could only be kept quiet, and that it should not appear as if the House of Hapsburg had been compelled to be just. It was one of those curious examples of the vicissitudes of human life, in which myself, a humble son of modest Hungary, was in a position to hold the destinies of the House of Hapsburg and all its crowns in these hands. I said : Be just to my Fatherland, and I will give peace and tranquillity to Vienna. They promised to be just, and before twenty-four hours I gave peace and tranquillity to Vienna, and before the Eternal God, who will make responsible my soul, before history, the independent judge of events, I have a right to say that the House of Hapsburg owes its existence as a dynasty to me.

He had better have let the dynasty go. Its preservation under any circumstances was not exactly the kind of work upon which Kossuth had reason to congratulate himself. For the Emperor broke his word. His advisers began an ill-disguised policy of intrigue against Hungarian liberties. Shortly after they threw off the mask and openly espoused the cause of Jellachich, Ban of Croatia, who was making war on Hungary, and whom they had officially branded as a traitor.

THE HUNGARIAN REVOLT.

The story of the Hungarian revolt against Austrian bad faith is a long and lurid tale of bloodshed and of wrong. It recalls to the English reader two terrible pages in the history of modern Europe. One is the Irish rebellion of 1641, and the other the struggle of revolutionary France against the Vendée on the one side and coalesced Europe on the other. It is vain to try to paint that bloody scene. It is one long hideous welter of carnage irradiated by heroism as magnificent as any recorded in the warfare waged by nations for liberty and independence, but it is sullied by treachery as base and treason as foul as ever made men ashamed of man. The death struggle of a nation of 15,000,000 against the coalesced forces of two great empires was tragic enough to command the sympathies and to stir the pulses of the world. But a more sombre aspect was given to the tragedy by the insurrection within the revolution, the rising of the Serbs in the Southwest, and the not less horrible revolt of the Wallachs in the Southeast.

AGAINST DESPERATE ODDS.

The Magyars a minority in their own country, an aristocracy reigning in the midst of a peasantry

STORMING OF THE MAXERLINIE, OCTOBER 28, 1848.

(The pictures on this and opposite page are reproduced from rare prints which were suppressed during the Hungarian revolution.)

GENERAL GORGEI STORMING BUDA, MAY 4, 1849.

ATTACK OF CAVALRY ON SQUARE OF INFANTRY AT RAAB.

SURRENDER OF GENERAL GORGEI AT VILLAGOS, AUGUST 10, 1849.

largely of an alien race but yesterday emancipated, and too new to freedom to appreciate its blessings, were confronted by the savage hordes of Jellachich the Croat, the disciplined legions of the Austrian Empire, the jacquerie of the Serb and Wallachian insurgents, and at last by the overwhelming forces of the Czar. They had as their chief a lawyer-journalist inexperienced in war and without official training; their treasury was empty, their troops were undrilled and largely armed with scythes and clubs, their officers—Irish Polish and Hungarian—were at feud with each other and jealous of the civil government, while their commander-in-chief was a professor in chemistry who played traitor to the cause. But for Gorgei's treason the Hungarians might have triumphed in face of all odds. It is magnificent. Even after the lapse of half a century the story of the undisciplined handful of patriots hurling back in a score of battles the onslaught of splendidly equipped armies stirs the blood as the sound of a trumpet. If we feel it now, how much more keenly must Kossuth have felt it then!

THE HORRORS OF THE STRUGGLE.

The horrors of the revolt within the revolt, the savage insurrection of the Slav and Rouman against the Magyar, who was conducting his war against the Austrian, seem to carry us far further back than the middle of the nineteenth century. But these Eastern lands are still under the shadow of the Ottoman Turk; and Serbian and Wallach were not less ready than the Bashi-Bazouk and Circassian of a later day to disgrace the human name. The historian says:

In the middle of May the Serbian insurrection commenced. Every horror which the human imagination could devise was perpetrated upon the unfortunate victims; some were roasted alive, some buried to their necks in the earth and left to be devoured by swine, the eyes of others bored out, and in their savage cruelty the rebels spared neither age nor sex. . . . The British Consul-General of Belgrade in Turkish Servia was obliged to lay a complaint before the Prince of that country of the disgusting spectacle presented in the market-place, by the ear-rings and rings of women offered for sale with the ears and fingers of those to whom they had belonged still attached to them, cut off by the troops and auxiliaries of Jellachich.

Horrible massacres were perpetrated in cold blood by the Wallach insurgents on the respectable inhabitants, or those who were in the enjoyment of wealth and influence. Some were beaten to death with cudgels, some tortured with pitchforks, some thrown into pits, and others crucified on their own doors.

With such horrors going on all around, it required some nerve to conduct the revolution without giving way to the demand for vengeance. Kossuth and his associates suppressed these insurrections without disgracing their cause by reprisals in kind. They dealt with their Vendée and the Croats with severity and success. It was more of an inflammatory aggravation of their real trouble than a mortal malady. But it must be borne in mind that it was going on, with all its circumstances of ghastly horror, at the same

time when the nation was engaged in a life and death struggle against the Austrian.

KOSSUTH'S CRY TO ARMS.

Kossuth was no soldier. He was merely a maker of soldiers. He was the eloquent voice with which the genius of his country addressed her sons. He was the speaking trumpet of the Goddess of Liberty. Hungary heard his glowing words, and wherever his words fell armed men sprung from the ground, asking only to be allowed the privilege of dying for their country. When the Austrian armies were pouring over the frontiers at half a dozen different parts this was the summons which he addressed to the Hungarians:

He who has influence in a county, or even in a village, let him raise his banner; let no music be heard upon our boundless plains but the solemn strains of the Rackoczy March; let him collect ten, fifty, a hundred, a thousand followers, as many as he can gather, and marshal them the way to Veszprim; between Veszprim and Weissenburg the women shall dig a deep grave in which they shall bury our enemies, or the name, the honor and the nation of Hungary. And on this grave shall stand a monument with the record of our shame, "So God punishes cowardice;" or we will plant on it the tree of liberty eternally green, from out whose foliage shall be heard the voice of God, speaking as from the fiery bush to Moses, "The spot on which thou standest is holy ground. Thus do I reward the brave. To the Magyars freedom, renown, well being, happiness."

On another occasion he spoke directly to the troops in the camp:

"Magyars," said he, extending his hand, "there is the road to your peaceful homes and firesides. Yonder is the path to death; but it is the path to duty. Which will you take? Every man shall choose for himself. We want none but willing soldiers." The great body of the army replied by shouting with one voice, "Liberty or death."

KOSSUTH AT BAY.

But he did not merely incite to action. He was the heart, the brain, the soul of the whole movement. Sorely against his will he was compelled to become first Minister and then Governor of Hungary. His health, frail and broken, more than once threatened to give way in the midst of the terrible strain. But he persevered. Surrounded by hostile armies and traitorous friends, weak, worn and over-driven, he never lost heart, never struck sail to a fear. The Hungarian armies triumphed or were defeated. The capital was taken and retaken. The government fled from place to place. One series of invading armies was no sooner driven headlong across the frontier than another series began to form. But still in the centre of it all, indomitable to the last, Kossuth toiled with superhuman strength. One who worked with him said:

One might almost say that the physical part of him has scarcely an existence of its own. The man is nothing but spiritual energy, for if it were not so, the perishing sickly frame would long since have dissolved in spite of all the skill of the physicians. He will not be ill, and he is not ill.

He kept five secretaries going ; and to give some idea of the labors of the evening I will mention that from half-past seven till half-past eight, he dictated to us, at the same time, five important letters all of different contents. One of them was to Dembinski, one to Bem, the third to Paris, and the fourth to Gyongyos, and the fifth to Vienna. Three were in German, one in French and one in Hungarian.

It was all in vain. The Austrian was beaten, but the Russian came to his aid. That which the Hapsburg could not accomplish the Czar accomplished, aided by the perfidy of Gorgei, the chemist-soldier whom Kossuth failed either to control or to cashier.

KOSSUTH IN EXILE.

The Austrian hangmen followed in the rear of the Russian armies. Many of the Hungarian patriots were hanged. Others were shot. Marshal Haynau flogged the women and butchered men at his own sweet will and pleasure, long before the draymen in Barclay and Perkins' brewery applied their horse-whips to the Austrian butcher. Kossuth and a handful of his friends found refuge in Turkey ; his wife and children were thrown into jail, and order once more reigned in Hungary as in Warsaw.

III. EXILE.

Kossuth spent the last half of his life in exile. He began in Turkey. The Sultan refused to give him up to the Austrians and Russians, who clamored angrily for the Dictator. He risked war rather than betray the refugee who had sought shelter in his dominions. At first the Commander of the Faithful suggested that their extradition might be rendered impossible if they became Moslems. General Bem agreed. So did some others. Kossuth, who was always austere Protestant, refused. He wrote : "For my own part, when asked to abjure the faith of my forefathers, through terror of the executioner, welcome rather the gibbet and the block." The Sul-

tan did not press the point, and as England and France supported him, the refugees felt safe.

THE INCIDENT OF MARSEILLES.

Just before leaving Hungary Kossuth had buried the crown of St. Stephen and the Hungarian regalia in a wood near Orsova, where they remained undisturbed for many years. They were recovered in happier times, and the crown will grace the temples of Francis Joseph's successor. Kossuth applied himself in his Turkish exile in learning the Turkish grammar. After some time the American Government sent a ship to bring him westward. England, rather shabbily, made a similar offer, but Kossuth accepted the hospitality of the Stars and Stripes. His ship called at Marseilles. President Napoleon, then preparing the *coup d'état*, refused to allow him to pass through France. Kossuth wrote one of the first of his many letters to French Republicans, acknowledging their kindness, but stigmatizing the conduct of their government. In this letter he mentioned the following significant incident :

Last evening one of your brethren (of our brethren), an operative of Marseilles—I know his name and I shall not forget it—came, notwithstanding the cold, swimming through the water, on board the American frigate to grasp my hand. I pressed his hand with pity, with emotion, and gently reproached him for his temerity : "Que voulez vous ?" He answered, "I desired to touch your hand ; I could not find a boat ; I took to the water, and here I am. Are there any obstacles to him who wills ?" I bowed before these noble words ; the love of liberty, the sentiment of duty and fraternity were mine before coming to Marseilles ; but it is at Marseilles that I found the motto, "There are no obstacles to him who wills."

A FAVORITE PORTRAIT OF KOSSUTH.

That motto shall be mine. Vive la République, Salut et Fraternité.

HIS VISIT TO AMERICA.

Kossuth when he went to England found a welcome not less hearty from the masses of the English people.

The classes stood aloof. The populace welcomed him with a generous enthusiasm. He spoke frequently, eloquently and well. When he crossed the Atlantic he was received with immense *éclat*. The governments, the legislatures, and the citizens of the Republics of the West vied with each other in showering blessings upon the Deliverer of Hungary. Kossuth in return made many eloquent speeches, most of which are dead as the roses of last summer. But it is interesting to disinter from these forgotten orations a sentence or two in which he pleaded earnestly for that reunion of the English-speaking race which now seems to be approaching realization.

HIS PLEA FOR ANGLO-AMERICAN REUNION.

Addressing American citizens on one occasion, he said :

Oh ! let me entreat you to bury the hatred of past ages in the grave where all the crimes of the past lie moldering with the ashes of those who sinned, and take the glorious opportunity to benefit the great cause of humanity.

You are blood from England ! bone from its bone, and flesh from its flesh. The Anglo-Saxon race was the kernel around which gathered this glorious fruit, your Republic. Every other nationality is oppressed. It is the Anglo-Saxon alone which stands high in its independence. You, the younger brother, are entirely free, because Republican. They, the elder brother, are monarchical, but they have a constitution, and they have many institutions which even you retain, and by retaining them have proved that they are institutions which are congenial to freedom and dear to freemen. The free press, the jury, free speech, the freedom of association and the institution of municipalities, the share of the people in the legislature, are English institutions ; the inviolability of the person and the inviolability of property are English principles. England is the last stronghold of these principles in Europe. Is this not enough to make you stand side by side with those principles, in behalf of oppressed humanity ?

Kossuth, though dead, yet speaketh.

It is unnecessary to describe at length his subsequent career. He intrigued, agitated, wrote and spoke constantly on behalf of Hungarian liberty. He tried to bring about a rising in Hungary in 1859, and again in 1866 ; but without avail.

WHAT KOSSUTH DID.

His real life work was over with the Crimean War, which he helped to bring about. One of his biographers writing immediately after his exile thus sums up not unjustly the work of his life :

It has sometimes been asked, what has Kossuth done for Hungary ? He has roused the public spirit ; produced combined action in her separate county meetings ; he has asserted the ancient Hungarian right of liberty of speech and of meeting ; he has reformed the abuses of a privileged class, and roused them to a sense of the moral obligations which they owed to their countrymen ; he has carried equality of taxation, abolished by law the immunity of the nobles to pay taxes ; he has reconciled the interests of the various classes ; he has stimulated trade and manufactures, and awakened a proper spirit of emulation among the artisans and merchants ; he has established savings banks, railway companies, and many

other institutions for the benefit of the people. He has raised the social position of professional men ; he has carried the law by which the peasant was made a free citizen, and by which copyholds were transformed into freeholds ; reformed the municipalities and enlarged the suffrage, while retaining a property qualification, and he has maintained the just influence of the aristocracy and the power and the privileges of the Crown. In a time when the King of Hungary betrayed his subjects, broke his coronation oath, and abandoned the kingdom to foreign and unprincipled Ministers, when no choice remained but to submit to despotic rulers and martial law, or to arm in defense of the country, Kossuth raised an army where there was none, restored the finances, found money, ammunition, arms, soldiers, provisions, and preserved Hungary from anarchy and confusion.

IV. PROPHET.

Louis Kossuth's closing years were spent in comparative comfort, but he bore the burden of life with impatience and showed even more than the usual bitterness of the exile. Old age is in itself a heavy burden, and Kossuth was very old before he passed away. When he was in his seventies he kept his spirits up to some extent, but after he passed the eighties he gave way more and more to gloom.

HIS LIFE AT TURIN.

One of the pleasantest pictures of his life at his Turin retreat was given by his sister, Madame Louisa Kossuth Rutthag, who, writing in 1881 to a friend in America, thus described the life of her illustrious brother :

You will be glad to hear that he is enjoying not only good health for one of his age, being nearly seventy-nine, but also the perfect elasticity of his intellect. He has now a pleasant villa near Turin, surrounded by a handsome garden, which he planted himself and cultivated with the greatest care. Natural science is one of his favorite studies. Botany occupied a great deal of his time as long as he was able to climb the Alps ; now he has given it up, but has a fine collection of plants, dried, about 4,000 specimens, which he arranged with the greatest care. His sons are well situated and have ample opportunity to put their fine talents, improved by a generous education, to show and to practice. Francis is director of the sulphur mines of Cesena, in Tuscany. Louis is chief engineer of the Alla Italia Railroad line. None of them is married ; it seems their father does not desire it, perhaps because they have no opportunity to marry Hungarian women.

HOW HE SPENT HIS DAY.

Kossuth was always a great worker, but in his extreme old age he was able to do little but brood over the past. A recent visitor at Turin gave the following pathetic picture of the fading life :

At 11 o'clock he retires to bed, rising early in the morning, when his first business is to read all the newspapers which are sent to him in quantities from his native country. For several years he has been busy writing his memoirs, but the work goes on very slowly, because the writer often allows himself to fall into reveries, recalling past times, and he sometimes remains for hours thus absorbed, without writing a line, and when his sister comes

to beg him to rest she finds the sheet of paper before him still empty. And the good old man, with his white hair and vivacious eyes, smiles, rises from his chair, and, taking his sister's arm, walks up and down the room.

His private chamber was entirely filled with desks, book-cases, and rows of pigeon holes, in which were arranged with systematic neatness a correspondence of many years with the most notable men of this century. Kossuth was in constant correspondence with eminent persons all over the globe. Kossuth to the last could never forget that he had been Governor of Hungary, and could never quite escape from the delusion that he counted for something among the living forces of the New World. He was ever ready to propose to do this or that—as, for instance, when before Solferino he promised to help Napoleon by raising a revolt in Hungary, or when before Sadowa he was negotiating with Prince Bismarck; but in his later years even this illusion vanished and he took refuge in prophecy.

JEREMIAH II.

He was a lugubrious prophet, a veritable Jeremiah in exile. For Italy, the land of his retreat, almost alone among the nations, had he any good words. All the rest of the nations were doomed. From his conversations and his writings there may be gleaned a whole sheaf of predictions of disaster. Austria, of course, was marked for destruction. Repeatedly he predicted her final disintegration, saying that a country so devoid of homogeneity and composed of so many unassimilated elements could not stand the test of time. With German against Czech, Czech against Bohemia possibly, and Magyar against all, the Austrian empire was foredoomed. As to the Hapsburgs, he prophesied their early extinction as a dynasty. "The Emperor," he said, "has never been King of Hungary since the day when I uncrowned him in my address to the Parliament at Buda Pesth."

Hungary ought to survive. But the Slavonic deluge threatens, and who could say whether the Magyars would be able to hold their own against the Russian scourge? Kossuth could see nothing but evil in Muscovy. The age-long struggle between France and Germany seemed to him a mere bagatelle compared with the death which he foresaw in the near future between Austria and Russia for the Danube and the Dardanelles.

WAR INEVITABLE.

Here is one of his many wailing forecasts of a future fraught with the gloom and the terror of an eclipse:

Europe is on the verge of a vast conflict. It is inevitable. Nothing can avert it. The only cause for surprise is that war has not already begun. France and Germany could step aside and settle their differences peaceably without disturbing the balance of Europe, but not so is the great Oriental question between Russia and Austria. Russia knows that Constantinople could be taken by a *coup de force*, but it would be a barren victory. She could not maintain such a position without first getting possession of Bulgaria as a background. Austria cannot afford to be surrounded by Pan Slavism and crushed. A great thinker

has said that there was no good reason for the existence of Austria. Had Hungary succeeded in gaining her independence, Poland would have been liberated, and this would have been followed by a Danube alliance of small States, united only for common defense and offense, but each preserving its independence. The movement of Russia towards the sea, which threatens the peace of the world, dates from the downfall and division of Poland. That threw Europe open to the Czar. When the struggle opens, the Hungarians will fight against Russia to a man. They have still preserved their nationality, and know that if Russia succeeds all hope of independence is gone.

A CATACLYSM THE ONLY HOPE.

But it was not merely the the Eastern question that filled him with dismay. The whole of the civilized

KOSSUTH IN HIS OLD AGE.

world appeared to him to be sick unto death. Here is his despairing diagnosis of our social state:

It is clear that the social industrial question surmounts all others. Society is sick of a malady that defies cure. The progress of civilization has given the great mass of people desires which were once confined to the few and rich. The workingman to-day regards as necessities what his predecessors considered luxuries.

The so-called State Socialism will not cure the sickness. An equal division of property will be followed in time by an unequal possession of property. The weak will always go down before the strong.

Monarchy will not cure the malady. Monarchy is going down all over the world, and Republicanism is coming up. The Monarchical principle is not extending itself, while

the principle of Republicanism is rapidly gaining ground, as the recent change of government in Brazil shows. It is a certain law that where one system ceases to extend itself, and an opposing system keeps on growing, the first is bound to be displaced.

But Republicanism will not cure the malady, for is there not in America the nearest possible approach to a real Republic, with an enfranchised democracy, free education and popular institutions? Still, America has this social malady too.

There seems to be no remedy. Meanwhile, the earth will continue to revolve, and some day the present population may be swept from its surface, and a new race, capable of a new civilization, may appear. A cataclysm is the only hope of solution.

"A BROKEN-DOWN OLD MAN."

There is something profoundly melancholy in watching the sombre pilgrimage to the tomb of one who in his time played so active a part, who roused such high hopes, who realized such great things, and yet who in his old age had outlived all his enthusiasms, had dispelled all his illusions, and moldered down to death without hope, without joy. What can be more sad than the following bitter outburst of a broken-down old man? Speaking to a fellow countryman, he said :

I prefer solitary nature in the mountains. She, at any rate, does not deceive me. Here, in Turin, I lead a perfectly secluded life. I visit no Italians, and receive scarcely any visitors. As a rule, I am at home to no one. For many years I have sought forgetfulness in work. This is now no longer possible. I am a broken-down old man. Work fatigues me, and the painful wretchedness of solitude weighs daily more and more upon me. I am alone with my memories, alone with my bitter experiences. I was formerly unable to compass my aims without helpful fellow-workers, and then I learned to understand mankind. Plato is right : life is no blessing, no gift, but a duty ; no gain, but rather a loss. When, on the brink of the grave, a man makes up his account, the balance is always on the wrong side. I have asked myself whether life was worth living. One only comfort remains to me. I have persistently followed duty.

DEATH BETTER THAN LIFE.

Quite recently the Hungarian patriots restored the old church in which ninety years before Kossuth had been christened. The demonstration only afforded him a fresh occasion for bitter reflection :

I am a very old man indeed. My eyes are tired, my hand is heavy, my power of work has decreased, and yet the honor of my modest name and a written contract oblige me to work. The church in Tallya, in which I was christened ninety years ago, has become a ruin like myself. But what man has built, when it falls to pieces he can build up again. Man himself is dust and ashes, as we have it in the old Hungarian funeral service. That is the difference between the two ruins.

In answer to the committee's complaint that not much money was subscribed for the restoration of the church, and that what there was did not come from the palaces, but from cottages and workshops, M. Kossuth said :

You did not get much money for your good purpose because you insisted on stating that I was christened in that little church. Had you kept silence on that point there would have been the usual 100 florins from the Monarch, and where he subscribes the great of the Empire follow. For with them all is calculation. It is only those who live in cottages and workshops who follow the instincts of their heart. You will consecrate the renovated church on my ninetieth birthday. Ninety years ! What a terribly long time for the life of one man ! Why, ten such lives take us back to the time of Arpad. It is terrible for me to think that with all the blows of my purposeless, joyless life, I should have to bear the burden of living beyond my ninetieth birthday. For me, the pariah without a home, the Preacher's words are full of significance when he says that for the son of man the day of his death is better than the day of his birth.

A LIVING PROTEST TO THE LAST.

Stern and uncompromising to the last, Kossuth refused to allow either of his sons to go to Tallya to the ceremony of consecration. On explaining his refusal, he stated once more the reasons which rendered it impossible for him to return to his native land. He said :

Everybody in Hungary knows the reasons for which I refused to set foot in Hungary, even should I die in exile, so long as Hungary recognized as its king a prince who is at the same time Emperor of Austria. Every one knows that I cannot admit the compatibility of a double crown with the independence of Hungary. This confession of faith to which the Hungarian nation once agreed puts me in contradiction with my nation. I will not discuss the question. The future will show who was right. But I hold fast to this opinion with all my mind and all my heart until the hour of death. I am a living protest against the Hungarian nation's faithlessness to my creed. I must, therefore, refuse myself the joy and happiness of seeing my home again. I was turned out of my country with my sons. It would be ridiculous to let them appear for mere vanity's sake in Hungary.

So it was with bitterness and resentment in his heart that the old man went down to the dark valley. It was not merely that the Hapsburg had triumphed. That might have been borne. But the Hungarian nation, for which he had fought and suffered, had proved faithless. That was the bitterest drop in all his cup of sorrows.

In vain did the Hungarian nation drape itself in black and do public penance before the bones of the illustrious exile. In vain, and yet not in vain. For the memory of the great ones of the world, those great not only in achievement but in aspiration and in sacrifice, is a perpetual benediction. Once, not so long ago, the aged patriot said :

If I had to choose my place among the forces of nature, do you know what I would choose to be ? I would be the dew that falls silently and invisibly over the face of nature, trampled under foot and unconsidered, but perpetually blessing and refreshing all forms of life.

He has had his wish. For the memory of Kossuth will be for generation after generation as the dew of freedom upon the minds of the Magyars.

SOME NOTES ON BERMUDA AND ITS AFFAIRS.

BY THE EDITOR.

THE ROYAL PALMS.

SO far as I can remember I asked only one question before starting: "Is it necessary to know anything about Bermuda in advance?" I was assured by the intelligent friend who had been there that it was quite unnecessary. He understood, of course, the purport of my question, and knew that unless something were to be lost through lack of previous preparation by the study of guidebooks and encyclopedias, I should prefer simply to secure my passage and find things out in my own way after I arrived. My experience fully justified my friend's reply. I therefore suggest that if any reader has already made up his mind to try a Bermuda voyage, it might be well to lay this article aside for the present. He will find it more interesting after he comes back. Let him avoid every kind of literature about Bermuda, remaining in his state of hazy ignorance as to where Bermuda is, as to the people who live there, and as to the language they speak,—and enjoy the satisfaction of being an original discoverer. He will return with so keen and warm an interest in all that pertains to that bit of coral rock out in the middle of the ocean, that he will be glad enough to read this article,—and everything else that he can conveniently find,—for a comparison

of other people's impressions with his own original ones, and for the addition of some items of information to those which he will have honestly gleaned for himself by the first-hand process of seeing and questioning. But if you do not intend to go to Bermuda, and cannot persuade yourself to go on the mere chance of the thing, but must first know what is to be found there and what the use of going at all may be, I hope that these fragmentary notes may have the effect of convincing at least some of you that the trip is eminently worth while, and that in fact Bermuda has been only half discovered after all, so far as you are concerned.

It is a long time since I studied geography in school, and I do not remember that I learned anything whatever in those days about Bermuda. Geography, as it was once taught in our district schools, did not tend to give such a particularly realistic sense of the world in which we live. I have since then relearned the geography of much of North America and Europe, together with the Mediterranean fringes of Asia and Africa, by diligent travel. But Bermuda, I must frankly confess, remained only a name. I did not know exactly where on the map to look for it. From the bills of fare I had learned that Bermuda gives us our best supply of very early potatoes and onions. But if Barbadoes, or Trinidad, or Martinique had suddenly changed positions with Bermuda, I might never have known the difference. It takes some candor to make this acknowledgment, for Bermuda has played an important part in the history of the western world; and now that the islands have awakened in me a feeling of most affectionate interest, I am at a loss to know how it happened that I could for so long have escaped having anything like an intelligent, realizing conception of Bermuda as a distinctive factor in history and a prominent topic in the annals of early western discoverers and colonizers. Yet doubtless there are several American professors of history, besides several millions of other citizens of the United States, whose knowledge of the "Summer Islands" is almost as vague as mine was before I rediscovered for myself in 1893 the coral rock upon which Juan Bermudez was wrecked in 1515, where Sir Thomas Gates and Sir George Somers of the Virginia Company were involuntary visitors in 1609, and where in 1612, eight years before the Pilgrim fathers landed at Plymouth Rock, an English colony was established whose traditions have been maintained without a break for the past 282 years. The personal tone of my introductory paragraphs has only this excuse: They are meant to be a testimony to the educational value of the "historical pilgrimage." Travel doubles the teacher's usefulness, and it gives life and reality to the pupil's lessons.

(All illustrations with this article are from photographs by Richardson, of Hamilton, Bermuda.)

SCATTERED ISLETS AS SEEN FROM THE LIGHTHOUSE.

Really Bermuda is very isolated, very small, and very easily overlooked. It lies 700 miles from New York, almost exactly southeast. From Cape Hatteras the distance is 625 miles due east. The spot is some hundreds of miles south of the course of the European steamship lines to the United States, and a long ways seaward from the ordinary route taken by most of the ships that traffic between the mainland and the West Indies. In fact it is asserted that Bermuda is the most isolated locality that is inhabited by human beings. No other islands are anywhere near. The distance to the Bahamas and West Indies is greater than to the United States. The inhabitant might well feel himself belonging to a little world of his own, and learn to rely much upon his own resources and to imbibe an intense affection for his solitary bit of terra firma surrounded by its vast expanse of restless ocean. I shall not venture to discuss the geological structure of Bermuda. The island is of coral formation, and owes very much of the novelty which so impresses and delights American visitors to that fact.

The presence, at a point so exceptionally far north, of climatic conditions that would offer inducements to the coral insect to build an island, is due to the Gulf Stream. The Gulf Stream is a difficult topic. Every sea captain has his own views upon the subject; and most of them consider that the passenger who asks questions or makes remarks about the Gulf Stream is taking a somewhat unwarranted liberty. At least we may well hold to the old view that there is such a thing as the Gulf Stream, that it has upon its western side a somewhat definitely marked course even as far north as the line between New York and Bermuda, and that it has a roughly though not definitely assignable limit also upon the eastward side. Approximately one may say that in going from

New York to Bermuda, a distance of 700 miles, one sails for 200 miles through the Gulf Stream and crosses that great river at almost exactly right angles with its general course. The temperature of the water in the Gulf Stream is about 78 degrees Fahrenheit, and when one has crossed it going towards Bermuda the water remains of about the same warmth all the way.

Bermuda lies in a zone of sea so surrounded by great warm currents that it is quite impossible for any breath of cold wind ever successfully to pass the barrier. Labrador storms may sweep down past Halifax and Cape Cod, bearing straight for the devoted Bermudas, but they find the Gulf Stream swelled to a width of three or four hundred miles, and are as balmy as Florida before they have crossed it. Manitoba winds may occasionally reach even to the Carolinas, and blow from Cape Hatteras without much loss of their original ferocity; but the Gulf Stream flows on and Bermuda basks in perpetual summer, not so much as dreaming of the nearness of the enemy which has successfully traversed almost nineteen-twentieths of the distance only to perish against that impalpable barrier, the Gulf Stream. As I have said, Bermuda owes its existence to the fact of these warm ocean currents which give a temperature favorable to the energetic existence of the coral insects that have built up the reefs. Almost everything else that characterizes Bermuda, so far as its natural life and its productive capacities are concerned, is due to this same fact of a warm and even climate protected and maintained by great environing ocean currents.

It is customary to say that "the Bermudas" are a group of 365 islands. But for ordinary purposes it is not convenient to consider Bermuda as consisting of more than one island. The two largest members of the group are separated by a passage so shallow that

it has been a simple and not very expensive matter to connect them with an excellent causeway—a solid road, which now makes the two islands one in fact. The other important islands, with one or two exceptions, lie close together and are connected by bridges, the whole inhabited group forming a chain somewhat in the shape of a semicircle, and extending a total distance of eighteen or twenty miles. The width of the chain varies greatly. It is perhaps not more than four or five miles wide at the portions of the greatest average extent. The total superficial area of the entire group is less than twenty square miles. Most of the islands which are counted to make up the alleged 365 are mere points of land lying in adjacent clusters about the larger islands, and are either barren rocks hardly large enough to pitch a tent upon, or else carry a thin veneer of soil and produce a few blades of grass and a stunted tree or two.

Outside the chain of islands for a distance of several miles, and involving the whole group in a circle which is perhaps thirty miles in diameter, lies a series of coral reefs. The most perfect acquaintance with the channels is requisite to bring a ship safely inside these hidden but dangerous masses of rock to a harbor in Bermuda. At low tide, it is true, a few warning points visibly obtrude; but at other times there is nothing to suggest to the inexperienced observer that the clear outlines of Bermuda are not easily approachable in right lines from any direction. The mariner must thread his way tortuously and tediously to gain his entrance or exit, and not the least delightful part of a visit to Bermuda is this experience of entering or leaving the harbor. The wonderful and ever changeable colors which play across the face of the sea, due chiefly to the hidden coral reefs, can scarcely be imagined by one who has not visited tropical waters

A PARISH CHURCHYARD.

and known the peculiar charms of coral islands. I can say from glimpses of the Bay of Naples and from voyages among the islands of Greece and along the Levantine coast, that the brilliancy of Mediterranean effects does not at all equal that of Bermuda.

The early discoverers very quickly formed a correct impression of the climatic character and advantages of Bermuda. In 1610 an account was sent to London, which was published in a little book that same year, from a member of the Virginia Company's

A TYPICAL BERMUDA HOME.

party under Gates and Somers that was wrecked on Bermuda in 1609. The Bermuda colony was planted in 1612, and in that year a supplementary statement was sent to London to be published in a second edition of the little book just mentioned. A copy of this edition, printed in London in 1613, is preserved in the colonial library at Bermuda, and I examined it with much interest. Its descriptions show how acute were the discoverers and colonizers of three centuries ago. It seems that a Spanish wreck in the previous century had stranded some live hogs on Bermuda; and the English settlers found the cedar woods full of herds of wild swine descended from those castaways. This fact explains the design on the old Bermuda coins. Although the so-called colonial "hog money" circulated to some extent until a few years ago, it is now very rare, and collectors pay handsomely for every stray piece that is offered. The "Plaine Description of the Bermudas, now called Sommer Ilands," sent back to England in 1610 declared:

"These Islands of the Bermudos have euer beene accounted as an inchaunted pile of rockes, and a desert inhabitation for Diuils; but all the Faines of the rocks were but flocks of birds, and all the Diuils that haunted the woods were but heardes of swine."

The early settlers found the islands to be simply masses of rock covered with soil upon which grew as the principal native tree forests of moderate sized cedars. So fearful have the colonists been of the

effects of the loss of verdure and shade that they have held their cedar trees as something too precious to be ruthlessly destroyed. The consequence is that cedar groves still monopolize, if my impressions are correct, considerably more than half the area. There was no necessity for destroying the cedar in order to provide habitations. The coral rock was found by the early inhabitants to be, for that particular climate, a most adequate building material. In a cold climate it would quickly disintegrate. But in Bermuda, where the temperature is said to be never lower than sixty degrees Fahrenheit, the soft white slabs of the prevailing rock are durable as well as easily workable.

Any man who chooses may scrape the thin coating of earth off from his proposed building site and proceed to lay up the walls of his habitation with the blocks sawed out in the process of excavating his cellar. Thus when the cellar is dug the house may be ready for roofing, and if enough roofing material has not already been accumulated in the course of the excavation, it can easily be had by digging the cellar a trifle deeper, for the roofs in Bermuda are invariably made out of thin slabs of this same white coral rock. It has the advantage of being so soft that one may cut it with an ordinary hand saw ten hours a day for six months or a year without refiling the saw. It may be sawed into slabs two or three inches thick and eighteen inches or two feet square without particular danger of breaking the slabs. It looks somewhat like a very soft, chalky variety of marble. Though so workable when first quarried, it hardens upon exposure. Moisture permeates it easily, however, and it is desirable that a building should be covered with a thin coating of Portland cement, or a mixture of common plaster with cement. This coating is then treated with a heavy whitewash made of lime burned from the same ever-ready coral rock. The roofs and chimneys, as well as the walls, are kept constantly

whitewashed, and are absolutely as white as the driven snow. The first effect of the white houses scattered about among the trees is decidedly peculiar, and the glare is trying to unaccustomed eyes; but one soon comes to find these snow white houses exceedingly attractive. I was sufficiently interested in this subject of houses to ask many questions. It was the opinion of the best informed men that a house built of this material in the usual way is practically indestructible. That is to say, it will last so long as it is used and kept in ordinary repair by regular renewals of the cement and whitewash coating. Abandoned houses gradually crumble away. Not rapidly, however, for I saw many houses in Bermuda which have been unoccupied for a long time. Owing to the lack of an annual whitewashing they had become yellow and weather-stained, but they still look durable. There is a certain spaciousness and unconscious dignity about the native houses erected in Bermuda that impressed me more and more as I drove from one point to another. Many of the best houses have been in constant use for three or four generations. The softness of the coral rock of course makes it requisite to build walls of considerable thickness. The overlapping rows of roof slabs rest upon wooden beams and rafters. These, in olden times, were always made of the islands' own precious cedar. The durability of cedar being beyond that of almost any other wood, one finds in some Bermuda buildings old beams and rafters that are nearly or quite 250 years old and still in perfect condition.

No visitor who is at all mindful of social and economic conditions can fail to be strongly impressed with the excellent character of the house accommodation of the entire population, negro as well as white, and with the extraordinary neatness and cleanliness of the cottages. A cot of filthy or neglected appearance can scarcely be found anywhere in Ber-

THE WHARVES AT HAMILTON.

CRATING ONIONS FOR THE NEW YORK MARKET.

muda. This fact was one of extraordinary interest to me, for I have been accustomed to regard the houses of a people as in some respects the most certainly infallible indication of the nature and degree of their civilization. In the older houses one invariably finds enormous outside chimneys. In dimensions they remind me of the chimneys against the ends of the old log houses in the Ohio valley. But the Bermuda chimneys have never witnessed the roaring blaze of four-foot or six-foot cordwood piled against the mighty backlog. The cedar was too precious to burn so recklessly; moreover there was never any occasion for blazing hearths in Bermuda. My curious inspection of the architecture of old Bermuda chimneys soon discovered that their magnitude was due merely to a quaint arrangement of ovens. The Bermudians, being a civilized people of sober British antecedents, have always been accustomed to cook their food; and these big chimneys by no means implied a lavish use of fuel. They made it possible in fact to heat up a rather large quantity and superficies of stone with a modicum of twigs and other combustible matter. At a later period, when the commerce of the islands with the outer world became important and regular, it was found feasible to import sufficient coal or petroleum for cooking purposes, and the old chimneys with their complicated system of ovens and chambers went into disuse.

Compared with some of the smaller West India islands where the negro population swarms, Bermuda has never been densely inhabited. A hundred years ago it had some 15,000 people; and since then the num-

ber has at times been much smaller, but it has increased again to almost precisely that point. To be sure, this means for Bermuda a density of nearly one thousand to the square mile, which for a purely agricultural community would seem to imply remarkable resources of soil. So far as the islands are inhabited, some of the smaller ones being as I have already shown merely barren points of rock, they may be considered as containing a family of from five to seven persons for every acre, and the population has unusually even distribution. The capital town, Hamilton, has scarcely more than 2,000 people, who are pretty well scattered, too; and the other town, St. George's, is perhaps not one-third as large. The conformation of the islands is such that the population would appear to be rather scant than swarming. The numerous trees in the hedgerows and a great variety of topography give seclusion to the different farms; and the visitor, as he drives along the winding roads, sees an abundance of life and stir, and many people working in the fields, but ordinarily sees only one little field at a time. He must round a turn in the drive before he can see the next field; and the close-grown oleander hedge, or a row of cedars or palms, will shut off the view of fields beyond. In the Nile valley a single sweep of the eye comprehends the pettiness of farming plots and discovers the inhabitants of village after village toiling in their little checkerboard fields. In Bermuda precisely the opposite condition exists.

The distribution of population as between the two races remains remarkably stable. For a number of decades the whites have been forty per cent. of the

A TURN IN THE SHORE ROAD.

whole and the blacks sixty per cent. Down in the West Indies miscegenation is fast doing away with the sharp distinction between the two races, and full-blood whites as well as full-blood blacks are becoming comparatively few. In Bermuda there is no intermarriage, and the black race is comparatively free from admixture with white blood. Among the white inhabitants of Bermuda there are considerable elements of immigration from the continent of Europe, particularly Portuguese and Swedes ; but the bulk of the white population is of pure British origin and of old Bermuda descent.

The persistence of old colonial names is remarkable. Most of the principal families to-day, it may be said with truth, are the descendants of families which have occupied respectable or even important positions in Bermuda life and society for generations. I was particularly struck upon examining some old records and official lists to find the recurrence for two hundred years of names now conspicuous in the business and official life of Bermuda. The Bermudians have always been intensely attached to their little island, and have maintained a high standard of social life. In many respects their modes of life are more English than those of the mother country at the present day. They are more punctilious in their etiquette than Americans, and much more conventional in their manners than people of corresponding intelligence and means in the United States. Their parish life has a quaint flavor that is as delightful as any that one finds in the rural counties of England. There are nine parishes, with St. George's at the east, then in succession Hamilton, Smiths, Devonshire, Pem-

broke, Pagets, Warwick, Southampton and Somerset. President Patton, of Princeton University, who was born in Bermuda, and whom I found rusticated in the old family home which he maintains there and to which he retires as often as he can, called my attention very particularly to the singular strength of the Bermudian parish traditions. Devonshire, for instance, which is his own parish, is accustomed to speak with great pride of the number of Devonshire men who have taken rank in professional life. The Bermudian usually knows intimately very few people outside his own parish. His friends are the families whose parents were the friends of his parents.

The negro population of Bermuda is exceptionally interesting. It would seem to be the universal testimony of visitors that the Bermudian negroes are the best specimens of that race to be found anywhere in the world. It is said that there is some admixture of Indian blood, a number of Indians having been brought from the continent of North America and reduced to slavery in very early times in Bermuda and amalgamated with the African slaves. To what extent Indian blood has affected the negro characteristics no one can intelligently say. It is more likely that the peculiarities of the Bermudian negro are due to the refining effects of the climate, and to isolation under very exceptional environment. The climate is not debilitating like a tropical climate, the temperature seldom being higher than eighty in the shade in the warmest summer days.

Slavery was abolished in 1834. The colored people are now very intelligent, and one finds them attending the same churches with the whites, and often forming more than half the audience. The common schools of Bermuda are attended almost exclusively by colored children. Education is compulsory, but there is a strong prejudice among the whites against sending their children to the same schools with col-

AN EASTER LILY FIELD.

A CHARACTERISTIC BIT OF HIGHWAY.

THE CEDAR AVENUE.

ored children, in consequence of which the common schools have come to be practically the monopoly of the blacks, while the white children are taught at home or are sent to private schools. I may say as regards the present-day colored children of Bermuda that some little investigation of them and questions put to various specimens convince me that they are now in possession of better educational advantages than the average white children who attend the ordinary district schools of the United States. Their schoolhouses are better built and supplied, and kept in better order than our average American district schoolhouses, and the colored men who give instruction seem to me to be better-qualified than a majority of the teachers who are employed in our own much-vaunted public schools.

Many of the Bermudian negroes possess some property, and play rôles of considerable influence. Bermuda is, however, under the real domination of the white race. The negroes cannot be said to possess thrift in a high degree, although they live in decency and comfort, clothe their children well, and give no evidences either of degradation or of poverty. The climate is so kindly that negro families can live well upon small incomes. The average family in Bermuda is rather large, whether white or negro. The number of children born to the negro families is somewhat the larger; but this is offset by the fact that the death rate is higher among the blacks, so that the relative numbers of the two races are maintained at an unchanging ratio. The average of five or six children to the family would perhaps not be at all an overestimate. The negroes of Bermuda are adaptable and ready workers, but the majority of them are engaged in agriculture. Although there are numerous landholders among them, the most of the negro farmers are renters. The same remark is true, however, of the white farmers, though not in so high a degree by any means. The land of Bermuda is farmed in small plots, sometimes not larger than half an acre. While the land owners as a rule do not possess what elsewhere would be considered large estates, yet they usually have land enough to subdivide in a number of small farms or truck patches. I did not succeed in getting a satisfactory reply to the question: "What income would maintain a farmer's family in Bermuda, or how much farm land would be necessary to maintain a negro or Portuguese family?"

The secret of Bermudian prosperity, however, it should be said, lies in the fact that the ordinary rule of agriculture is three crops a year from the same land. The staples of production for a number of years have been early onions and potatoes for the New York market. The soil and climate are favorable to the development of these two crops, both of which are of very fine flavor and quality and of sure and prolific yield. The climate has made it easy to mature vegetables much earlier in the season than has been possible, out of doors, in other places easily accessible to the chief markets of the United States. This fact has meant very high prices for these crops. Of course Bermuda onions and potatoes would bring only ordinary prices if marketed at the time of year

when our own vegetables are procurable. The same piece of land will often be used in Bermuda to produce, first, a very early crop of onions to be harvested perhaps in midwinter, then a crop of potatoes to be harvested before the first of May, and in the summer a crop of sweet potatoes, of melons, or of something else. This third crop could be used for home consumption, while the potatoes and onions are far too valuable to be eaten in Bermuda. One finds the Bermudians themselves eating imported Nova Scotia potatoes at a time when half the population of the islands will be engaged in digging and barreling the early potato crop to be shipped to New York. Potatoes have been known to sell for \$25 a barrel on the wharf at Hamilton. Of late years, however, they have greatly fallen in price; for the production of early vegetables in competition with Bermuda has begun in the West Indies, in Florida, and perhaps elsewhere. The onion crop is even a larger and more important one for Bermuda than the potato crop. I was much interested in the fact that the low prices of onions had caused an unwonted discontent among the Bermuda farmers in the spring of 1893, in consequence of which a Farmers' Alliance had been organized and the crop had been held unmarketed and even undug for several weeks of deadlock between the farmers and the produce merchants who controlled the markets. The steamship company which transports the produce to New York was also an object of attack by the Alliance, on the score that its freight rates were much too high. In miniature one found all the elements of controversy which at times have played so large a part in the life of the Northwestern States with reference to the marketing and transportation of the wheat and corn crops.

Years ago, perhaps two decades ago, Bermuda was famous for its fruit. Orange groves were found in all parts of the islands, and even the cocoanut palm abounded. The peach was universally grown, and it is claimed by the Bermudians that the flavor of their peaches was the finest in the world. But the orange trees and peach trees were nearly all destroyed by pests which have in other regions played havoc with these same trees; and for some reason the cocoanut palm has largely disappeared. The banana is very extensively grown throughout the islands, but the fruit is used chiefly at home. The Bermuda banana is small but of delicious flavor.

The productivity of the land is remarkable. One would suppose successive crops of onions would impoverish the soil, and yet it is asserted that in some fields onions have been grown for half a century, year after year. Fertility is maintained to some extent by the use of sea weed, and guano and artificial fertilizers are imported. The price of farm lands is meanwhile very high, and little real estate is bought or sold. Different forms of leases are in use, but sharing the crop would seem to be the more common arrangement. Agriculture in Bermuda is, of course, almost exclusively hand work. The most familiar beast of burden is the donkey. A good donkey is highly prized by a Bermudian farmer, and is particularly dear to the African heart. A great many

horses, all of rather small size, are in use, and for draft purposes they are always driven singly. One never sees horses working in pairs in Bermuda, except the carriage horses kept for tourists by the livery stables. A good donkey seems to be worth as much in Bermuda as an average farm horse. My inquiries as to the price of donkeys were invariably rewarded in all parts of Bermuda by the reply that a donkey was worth eight pounds (forty dollars). The little beasts are exceedingly strong, they live forever, and their greatest point of value lies in the fact that they can survive on very little food. Beasts of burden in Bermuda have to be maintained upon provender imported from New York. For purposes of going to and from market a small donkey will serve the average farmer's family as well as a horse. Consequently, in view of the saving of provender, the donkey has high relative value.

One of the most valuable crops produced for export is the lily bulb. Perhaps nothing in Bermuda so impresses the average lady visitor as the fields of Easter lilies. For weeks together these fields are white as snow with their thick clusters of the great lilies, on stalks of uniform height. In recent years the cutting of lily buds for the New York Easter market has been a tolerably successful business; but the lillies are grown chiefly for the sake of the bulbs, which are harvested after the bloom has ceased and the stalk has begun to dry away. The floral beauty of Bermuda can hardly be overestimated. Roses grow luxuriantly and bloom throughout the entire year. The little houses looking like marble are usually surrounded by bright blossoms. The geranium is perhaps the most conspicuous of all, for it also blooms perennially and is a favorite with the Bermudians. Wild flowers of various sorts abound, and there are many flowering shrubs and trees of gorgeous character which are strange to American eyes. To my mind the most beautiful thing in the plant life of Bermuda is the profusion of oleander. This shrub grows wild and attains the dimensions of a considerable tree. It is often thirty feet and sometimes forty feet in height, grows so easily that it is the common material of hedges, and blossoms with a luxuriance hardly conceivable to one who has not seen tropical or semi-tropical efflorescence. Its pink blossoms for several months in the year form great masses of color in almost every possible glimpse of landscape from one end of Bermuda to the other, and they fill the air, moreover, with a delicious fragrance, as also do the lily fields. The cedar, as I have said, furnishes the principal shade of Bermuda, but the palm tree is grown for ornamental purposes, and one finds many rare and beautiful varieties of this noble plant.

An important modifying influence in the life of Bermuda has been the fact of the military and naval occupancy of the island by the British Government. Bermuda has always been recognized as possessing exceptional strategic importance. At the time of its first occupancy by the English in 1610 its naval value was clearly recognized and was pointed out in the old document, from which I have already quoted, in the following very lucid passage :

"This Island, I meane the maine Island, with all the broken Islands adjacent, are made in the forme of a half moone, but a little more rounder, and divided into many broken Islands, and there are many good harbours in it, but we could find but one especiall place to goe in, or rather to go out from it, which was not altogether free from some Danger, where there is three fathom water at

THE IMMORTAL DONKEY.

the entrance thereof, but within six seaven or eight Fathoms at the least, where you may safely lie land locked, from the daunger of all winds and weathers and moore to the Trees. The comming into it is so narrow and straight betweene the Rockes, as that it will with small store of munition bee fortified, and easily defended, against the forces of the Potentest King of Europe, such aduantage the place affoordes."

The position of Bermuda, lying as it does between the British West Indies and British North America, makes it a very convenient rendezvous and coaling station for the British North American fleet, and it is winter headquarters for Her Majesty's ships, Halifax being summer quarters. Two regiments of British soldiers, moreover, are always kept in garrison on the island, and the army and navy officers play an important part in the social affairs of the community. Their presence there through so long a period has undoubtedly had considerable influence in maintaining a love among the Bermudians of out-of-door sports and of a certain measure of harmless social gayety. The Bermudians are famous yacht builders and sailors; and doubtless the British naval influence has helped greatly to maintain the high local standard of that noble diversion. Cricket flourishes amazingly, considering the mildness of the climate; and that, also, may be laid to the credit of the garrison.

The British Admiralty has done its share for the fame of Bermuda by building there the largest floating dock in the world. The navy yard is a place that thoughtful American visitors regard as highly worthy their attention. Not least interesting are the vast hulks of superannuated wooden men-of-war that lie at anchor and are far more impressive than the modern type of steel cruiser. The fortification of the islands is elaborate, the British Government having expended large sums of money in making the post impregnable.

The governmental arrangements of Bermuda ought to possess considerable interest for the Hawaiian islands at this moment, in view of Hawaii's approaching constitutional convention, with its task of providing for a stable representative system. Although the civil government of Bermuda is under the executive headship of the British military commandant, the colony is, in fact, self-governing as regards all its local affairs. The franchise is restricted to those possessing certain property qualifications; and at the last enumeration there were 1,166 qualified voters out of a total population of some fifteen thousand. Of the 1,166 voters, there were 763 white men and 404 colored. Each of the nine parishes is entitled to four representatives in the legislative assembly and the tenure of their office is seven years.

The revenue system is a very simple one, and it would seem to give universal satisfaction. Bermuda is the only spot on earth that I can now recall where the question of taxation is not in controversy. The colonial income is derived from a 5 per cent. tax upon all imports,—with a few specified exceptions, such as spirituous liquors and tobacco in all forms, which pay at higher rates. The only important article on the free list is coal, the importation of which the government wishes to render as little burdensome as possible. Out of the fund produced by the 5 per cent. ad valorem tax, and the duties on liquors and tobacco, the various departments of the government are maintained, and a most admirable system of perfectly graded and beautifully surfaced roads, extending throughout the islands, is kept in fine order. In several of the parishes a trifling parish rate is levied for certain local objects, but it is too light to bear objectionably upon any interest.

The Church of England, to which the great majority of the Bermudians adhere, has always been subsidized out of the colonial treasury. Each parish has its

Anglican church, and some of these structures are of great age, while all of them are attractive and substantial edifices. At Hamilton an ambitious and really very handsome cathedral church is now undergoing completion, replacing an earlier structure which was destroyed by fire. Other denominations, though not numerically strong as compared with the Church of England, are now also subsidized by the government in proportion to the number of their adherents and upon terms as liberal as those extended to the English church. Viewed as a civil and religious commonwealth, Bermuda's compact and well organized life is entitled to admiration and praise.

It is somewhat strange, perhaps, that an island whose commercial interests attach it so closely to the American mainland should hold so tenaciously its British loyalty and its English traditions. The constant presence in Bermudian life of the officers of the naval and military services would doubtless account to some extent for this undiminished fervor of attachment to the mother country. The growing popularity of Bermuda as a resort for Americans led several years ago to a prohibition on the part of Great Britain of the further sale of land to persons who were not subjects of Queen Victoria. This order has been resented by most of the Bermudians, and it has undoubtedly depressed the value of their real estate. Yet Americans must readily see that there was some propriety in the restriction. It could hardly be for the interest of Great Britain that the soil of one of her most important naval stations should be bought up and held as pleasure grounds for purposes of winter resort by people whose allegiance is to another flag. The exclusion of Americans from land holding carries with it no other disabilities or discriminations; for American visitors are welcomed in every way, and they always leave Bermuda with the hope of returning for another visit after a season or two.

A GLIMPSE OF THE HAWAIIAN ISLANDS.

BY ALICE WALBRIDGE GULICK.

THE eight inhabited Hawaiian Islands lie just within the northern tropic, in the direct path of all the trade between Canada and the United States on the one side of the Pacific, and China, Japan, the East Indies, Australia and other British Colonies and the South Sea Islands on the other. They stretch in a long chain from northwest to southeast for more than 380 miles. This gives a chance for inter-island enterprise and navigation. Thrown up on a narrow, submarine bank by volcanic action ages ago, they have gradually in the process of many years taken to themselves verdure and made a beautiful home for man.

Hawaii, the southeastern and latest formed of the group, is the largest, having in itself two-thirds of their entire area, and it gives its name to them all. It still keeps up its internal fires and boasts of the two largest, active volcanoes in the world, Kilauea and Mauna Loa, and the highest mountains of any oceanic island in the world, almost 14,000 feet high with snow on the topmost peaks most of the year. Its northeastern coast is most picturesque, with a succession of deep valleys of wonderful verdure, where the mountain streams rush down, divided from each other by steep green ridges. These valleys seem almost inaccessible except from the sea, but the natives make

VILLAGE OF GRASS HOUSES, BUILT BY JAPANESE LABORERS, HILO, HAWAII.

trails over the ridges and pass fearlessly on their sure-footed ponies as only such practiced riders can do. Along the coast eastward, the valleys are less frequent and the slopes that come more gently down to the sea show a series of beautiful sugar plantations with their wavy fields. At last appears the pretty little town of Hilo, which owes its location to the beautiful bay of the same name. Here, without much expense could be made a safe harbor on which a great navy could ride at anchor.

From Hilo, a road winds upward for nearly thirty miles, most of the time through a beautiful forest of tree ferns and other tropical trees, festooned with luxuriant vines to Kilauea, the great volcano. On the way one passes by tracts of land planted with coffee trees, their red berries showing bright through the shining green leaves. No more delicious coffee can be found anywhere than is raised here and in other parts of Hawaii. Enterprising settlers are taking up land along this volcano road, and proving by their experiments that a great variety of agricultural products can easily be grown, which will ere long be a source of wealth.

It is not strange that Pele, the goddess of the great volcano, should have been worshiped by a people ignorant of the true god, for there are few things in this marvelous world of ours that so convey to the mind the majesty of irresistible force. I have stood long on the brink of that fiery sea, too fascinated to move, and yet afraid to stay, when the fountains of liquid fire were playing high into the air and the red waves on the opposite shore were splashing their

blazing surf with a roar into the caves formed by the overhanging lava, and there was a constant rumbling as of smothered thunder. No words can fitly express the awe and wonder Kilauea must inspire when seen in such violent action.

Maui, the island next to Hawaii in size, has a mountain 10,000 feet high, Haleakala (the House of the Sun), on whose summit is the largest known extinct crater, 2,000 feet deep, and about twenty-eight miles around its outer rim. The view from the edge of this crater, especially at sunrise or at sunset, is sublimely beautiful. If the rosy clouds have not swept under your feet between you and the world below, you may look down over a ravishing landscape, the nearer green slopes dotted with peaceful herds grazing; farther down the homes scattered here and there in their groves of trees, still nearer to the sea level, the wide sugar plantations with their fields of vivid green, and the smoke columns rising from the chimneys of the busy mills, out to the blue bay where float the barks that are to bear the sweet harvest to foreign ports. Beyond the sharp green peaks of West Maui, across the channel, you see the long outline of sad Molokai, and to the left Lanai with its sheep pastures, while in the bay almost at the base of the mountain on whose summit you are standing, rise the bare rocks of Kahoolawe and close to it the tiny islet Molokini.

Now turn from this wide view over the Pacific with its indescribably beautiful colors and its islands with their coasts marked by the line of white breakers, and look down, down 2,000 feet into the mysteri-

SCENE ON BIRD ISLAND.

ous depths of the old crater. From its black floor rise the ancient chimneys, or vents, of the volcano, great cone-shaped piles of red and black lava, 500, 600, and even 700 feet high. Perhaps as you stand there the clouds will softly roll over the sides of the crater and fill it up to the very brim, till it looks like an immense seething caldron under your feet. Beyond the outer rim opposite, thirty miles away over the blue waters, Hawaii can be seen. "Far, vague and dim the mountains swim," the snowy tips of Mauna Kea glittering in the sun, and the cloud hovering over the "misty brim" of Mauna Loa may show you where "with outstretched hands, the gray smoke stands o'erlooking the volcanic lands."

Kauai, the most northern of the cluster of islands, is often called the garden of the group because of its fertility. It was the first formed, and there nature has had a little more time to grind down the rough elements she at first tossed together, and so form a soil that quickly repays cultivation. This island has larger streams than any of the others, and, following these up to their sources, scenery of most enchanting beauty is revealed. The bay of Hanalei, on the northern coast, into which flow the streams from a circle of wonderful green hills, is a marvel of beauty. As we stood looking toward these hills one day we counted fourteen of these mountain torrents, clearly shown against the dark green background, dropping down each in a series of white cascades to the plain below, where, after quietly watering the rice and sugar fields, they joined the river which carried them out to sea. The famous "singing sands," to discover the secret of whose music men of science have journeyed across the ocean, are found on Kauai. The microscope reveals tiny hollows in each little grain of this sand, which are supposed in some way to produce the sound.

It is clear that islands like these lying just within the tropics and having mountains of so great a height,

must possess immense variety of surface and climate, and when time and cultivation have developed them, may offer a list of products unusual in so limited a space. Owing to the almost constant trade winds, which reach them after passing over a vast expanse of ocean, as well as the cold current returned from the region of Bering Straits, the temperature of the waters about this group is ten degrees lower than that of other regions in the same latitude and the climate consequently cooler. The ordinary range of the thermometer is from sixty to eighty degrees Fahrenheit. Sunstroke and rabies are unknown and the Hawaiian group never have had those destructive hurricanes which have sometimes swept the islands of the mid-Pacific.

Two thousand miles from California, their nearest neighbor, they make the most important group in the North Pacific, an outpost of the Polynesian world, through which must cross the lines of commerce between the continents. Great changes and improvements have taken place in Hawaii in the last half century, which the United States has done more to bring about than all other nations combined. Amer-

COFFEE BERRIES.

ican missionaries have multiplied their food products and taught them agriculture. They have introduced a public school system, where education is compulsory and English the language spoken, so that all the younger generation, of whatever nationality in Hawaii, is growing up to read, write and speak English.

The principal trade of the Islands has been with the United States. Besides sugar and rice, which are now their chief products, bananas and pineapples are already sent to San Francisco and other ports. When the present political troubles are over and a stable government established, either by a strong alliance with the United States or by annexation, we may surely expect a large increase in the numbers, industry and enterprise of the population, and great development of the resources of the Islands will follow. To sugar, rice, bananas and pineapples, as articles of local and foreign trade, will be added cotton, ramie, silk, oranges, lemons, limes, coffee, cocoa, cinchona, spices, guavas, breadfruit, mangoes, olives,

WAIKEA RIVER, HILO.

cocoanuts, custard apples, grapes, berries of all kinds, alligator pears, taro, melons, peaches, figs and many other fruits, and an impetus will be given to the existing small trade in hides and wool. On the mountain sides, in addition to the corn and potatoes already grown, they will have most of the fruits of the temperate zones.

But, when the great cable is laid which is to connect California and Australia, and passing through the Hawaiian group, link its islands together; and the Nicaragua Canal is cut through the Isthmus and Hawaii has become the strategic point which will command its western entrance, while the trade of two great continents passes through her gates, who can foretell the bright future of this "Paradise of the Pacific?"

Those who have been fortunate enough to live in these beautiful islands, even though it may have been but for a short time, know that they have come under a charm and must ever after chant their praises. My own first glimpse of Honolulu can never be forgotten. It was a bright, moonlight evening, such moonlight as one seems only to find in the tropics. As our ship passed the bold promontory of Diamond

Head the lights of the metropolis of this island kingdom twinkled out among the trees, and we caught the graceful outline of the cocoanut-palm groves on the beach and the soft land breeze brought us the

HILO BAY.

odor of the flowers and fragrant vines. For a background to the fertile plain on which lies the town of Honolulu rose the rugged form of old Punchbowl, the long silent crater, and an irregular outline of green peaks died away in the distance.

As we drew near the quay, little brown kanakas were diving and sporting about the ship and calling to one another in their liquid jargon. Waiting to welcome us on the pier were a crowd of older and more sedate natives, many of them in white garments, and almost every one with a wreath of the fragrant *maile* or a garland of bright flowers about the neck. Mingling with them in friendly fashion, were their brisk white brothers, directing the many affairs which their enterprise had started with the running of a line of great steamships. We drove through the streets, not lined by rows of stately buildings, but shaded by the light branches of the algaroba and fringed by the royal palm. We passed the comfortable homes, which seemed bowers of delight set in their framework of sweet vines and bright-flowered shrubs and trees. At last we have reached and enchanted shore.

Strong are the charms of nature, and the delights of such a summer land to hold the heart that has once known them—the sweet breath of flowers; the cool depths of ferny valleys; the mountains, with

WAIOLAMA RIVER, HILO.

their slopes green near the sea and their tops holding awful mysteries of silent black chasms and never failing fire-fountains. But the chief charm of Hawaii is, after all, in her people. I do not mean that scum of adventurers which the waves toss upon all island strands as surely as they bring the battered sea-weed and the wave-worn shells (these have almost wrought the ruin of Hawaii), but her own warm-hearted generous, brown children and the fair-skinned sons and daughters of those who, more than seventy years ago, inspired by the noblest purpose that can move man, planted their light-bringing colony on her shores. These, and those who have been slowly drawn to them by affinity and enterprise, make most delightful communities at the capital and at other points in the islands. They are intelligent and cultivated, and no one who has come within the circle of their refined and unstinted hospitality can forget it, or ever after waver in the love his heart must hold for Hawaii.

Familiar as Honolulu became to me, that first impression never wore off. There was something delightfully free in a life where so much of the time could be spent in the open air, in the midst of a cultivated people, where all the necessities and most of the luxuries were close at hand and few of the annoyances. One could wish, it is true, that the ship *Wellington* from San Blas, Mexico, which in 1826 bequeathed its mosquitoes to Hawaii had never found its way there; but think of the comfort of a land where one can wander through thickets of ferns and luxuriant tropical growths, knowing that no snake is hidden among them, nor any insect whose bite is deadly!

Honolulu has good schools and churches, a college, a public library, street cars, electric lights, good markets

and commercial houses, a well-managed telephone system, a railroad, daily newspapers, beautiful sea-bathing and a healthful climate, as well as its refined and agreeable society. It has also a fine harbor, chiefly formed by the coral reef which surrounds most of the Island of Oahu, on whose southwestern side Honolulu is situated. The northwestern coast of Oahu is fringed by a range of steep mountains. These catch the moisture and send down their streams to water the fertile plain which makes the larger part of the island a garden where all the fruits and plants of semi-tropical climes can easily be made to grow.

It is amazing in these days when the records of human progress are so open to all who read and think, to hear many in the United States who would not like to be called ignorant speak of the high-minded and intelligent communities in Hawaii, who are now the ruling power there, as "filibusters and greedy adventurers." But at least one good thing will come out of all this political turmoil over Hawaiian affairs. The general public will learn the history of Hawaii and the noble character of her American colonists. They have with patience and long forbearance held the native element at the head of government for the last forty years, though often the misrule has been almost unbearable, and during the evil reign of Kalakaua, the late queen's brother and predecessor, the task of continuing a native monarchy had seemed hopeless.

The native monarchy in Hawaii is now at an end. Since the good and beautiful Bernice Pauahi Bishop, the last of the royal line of the Kamehamehas, refused the crown in 1874, its fall has only seemed a question of time. What is the future before that little island group, which seems by all the gifts of nature to be the brightest gem in the wide Pacific? America must answer the question.

A LORD OF THE ISLE.

AUSTRALIA AND THE COLORED RACES.

BY SIR SAMUEL W. GRIFFITH, PREMIER OF QUEENSLAND.

WHAT is to be the future of tropical Australia? Is it to be a "white man's country," that is, a country mainly populated by people of European descent, who earn their living by applying their own labor directly to the soil, and whose children, born and bred in the country, live and thrive in it and look on it as their true home? Or is it irrevocably ordained by nature that this territory shall be the home of the colored races? Each view is honestly held by many persons who have seriously given their minds to the question. But can either in our present state of knowledge be maintained with absolute confidence? Probably few persons are so constituted that their ideas of what is good or evil do not, to some extent, influence their opinions on all subjects that go beyond the limits of abstract truths, and involve the welfare of themselves or their fellows. And the consequences to Australia of the final answers to be given to these questions are so serious that it is not surprising if men's opinions are in this instance, as in others of less importance, colored by their wishes. Men who believe that the future welfare of Australia depends on its being preserved for the white races may be expected, not only earnestly to desire to give effect to their views, but to believe, even on slight grounds, that the attainment of them is practicable.

It should be remembered, however, that the desire to exclude the colored races from Australia is by no means universal. There are persons who regard the form of civilization of which Mauritius may be taken as a type as in every way desirable. A country in which the employer is relieved of all need to perform manual labor, and is waited upon by numerous servants; where, in short, the distinction between master and servant is clearly and permanently defined, has features which are not unattractive to many minds. The necessary incidents that in such a country the ruling class must be of limited number, and that the children of the masters, unless they emigrate, must in a short time become too numerous to be maintained in the privileged condition of manual idleness, are lost sight of. Yet it seems clear that in such a community, unless some other outlet is found for the increasing population, a large portion of it must sink from the caste of masters, and form an inferior class for whom it will be hard to find a place in the social system. What would be the ultimate history of such a country it is difficult to predict. The distant prospect, at any rate, is not so attractive as the immediate view appears to a short-sighted observer. And it is quite certain that such a state of society is not compatible with the system of government now established in Australia.

The strong feeling of antipathy to Asiatic races that is now so marked a feature of the British speaking people in America and Australia seems to be a modern

phenomenon. History records no instance of a similar race-hatred. Perhaps, however, the new phenomenon will appear upon consideration to be a natural consequence of a movement not limited to Australia or America, and which is one of the most important of modern times.

The phrase, "the living wage," itself indicates the fundamental idea of the movement. The improved education of the manual workers, which has enabled them to compare their condition with that of other

SIR SAMUEL W. GRIFFITH.

persons in the same community, and to discuss the reasons and justifications for the great existing inequalities, has led to the formation, in the place of mere vague and inarticulate aspirations, of a general and articulate, and—so to say—collective desire to better their condition, or at least to prevent it from falling below a tolerable level. It is recognized, or thought to be recognized, that there is a minimum standard of comfort below which their condition ought not to be allowed to fall. This is, indeed, put forward sometimes as an axiomatic truth. The distinct formulation of the truth is, however, only the

resultant of forces which have been operating for many years. The popular opposition to the introduction of Chinese and other colored races originated not in a fear of their numbers, or any dread of a forcible invasion, although that risk is not an imaginary one, but in an instinctive sense of danger likely to arise from unequal competition.

It was felt rather than argued that the standard of living of the Asiatic races is lower than that which has been accepted as normal in Australia, and that a workman cannot compete successfully with a competitor whose wants are completely satisfied out of a remuneration which will not maintain his rival in the comfort to which he is accustomed. In such a struggle the fittest is the man whose wants are least, and he will be the survivor. That this is the real ground of opposition is illustrated by the fierce objection that was made to the proposal made in 1890 to introduce Italian laborers into Queensland; their standard of comfort was thought to be lower than the normal standard of Australia.

In point of fact, the objection seems to be founded on unanswerable grounds. If unrestricted competition is allowed, the victory must be to the competitor whose wants are satisfied with the smallest return from his work. But it should not be forgotten that the underlying basis of the objection is identical with that upon which is rested the policy of protection to local industries. And it may well be that in the one case, as in the other, any relief that may be given by restrictive laws will prove, with the continuous expansion of intercourse between the different parts of the world, to be merely temporary. It is quite possible that the standard of comfort may, as that intercourse becomes more perfect, be finally fixed for all the world on the basis of the lowest standard of any competing country. In the meantime, most people will find it impossible not to sympathize with those who desire to put off that evil day as long as possible.

It is easy, then, to see why there may exist a strong, and even a passionate desire to prevent the establishment of that low standard in any part of the continent, where, if once established, its influence would necessarily and quickly permeate through the whole of Australia.

Reference has already been made to the unsuitability of the present system of government to a population consisting of a few masters and many servants. The system would be equally unsuitable whether the power of government were reserved to the employers alone or were shared by the poorer members of the white population.

If, then, tropical Australia is to be inhabited mainly by a colored population, not only will a new form of government be required, so that there will be two distinct, and probably antagonistic, forms of government on the Australian continent, but ultimately the standard of comfort for the working population of all Australia will be in danger of being reduced to that of the colored races.

If, on the other hand, the faith of those who be-

lieve that tropical Australia can become the permanent home of the white races turns out to be well-founded, a future, which most people will regard as fairer and happier, is open for that part of the continent.

A third view has lately been suggested, involving in a sense the combination of the two main theories, namely, that the cultivation of tropical Australia should be carried on by European farmers, each in possession of a small area of land and tilling it with the aid of a few colored laborers. This system is already in operation to a considerable extent in Queensland. It may be doubted, however, whether although admirably adapted as a temporary expedient in the process of substituting small estates for large ones, it can be regarded as essentially different in principle or in ultimate results from that of white masters and colored servants.

If this system should become a permanent institution, it is difficult to see how the creation of two different castes can be avoided. The caste of masters would, for a time at least, be more numerous, and would have stability within itself, but it would be none the less a caste, and the ordinary incidents of such a state of society would follow. There would be no room for the unsuccessful master or his family. In the mean time the system is doing admirable work. Employers and their families work in the fields, sometimes without, oftener with, their colored servants. And if tropical Australia is ultimately to be a "white man's country," it is by the working of this system that the possibility of the result will be shown.

But it is most important that it should be recognized that the whole question is still in an experimental stage. The effects of field labor in tropical Australia upon Europeans and their children cannot be certainly known in the first generation. Most careful attention should be given to the practical effects of such labor upon the health and vitality of the race. And, until the results are known, is it too much to hope that no action may be taken which might practically conclude the question, and condemn this part of the continent to the condition of an Asiatic province, where no room is found for the homes of our European agricultural population? Nor must it be forgotten that our knowledge of the adaptability of the Anglo-Saxon race to various climates and conditions is not exhaustive.

Many of these considerations are too often lost sight of, the disputants contenting themselves with vehement assertion—on the one side that white people cannot thrive, nor white labor do the necessary work; and on the other, that the Asiatic must go. The problem, however, is not to be solved by assertion. Statesmen will apprehend and steadily bear in mind the real nature of the question, remembering that their policy will not only govern the future political and social history of tropical Australia, but must seriously affect the welfare of the whole continent.

MISS BARTON AND HER WORK,--A PROMISED BIOGRAPHY.

FROM the tenor of the allusions that have been made at different times by the REVIEW OF REVIEWS to the character, career and great philanthropic undertakings of Miss Clara Barton, our readers will not need to be assured of the unvarying desire of this magazine, not merely to do grudging justice to our eminent countrywoman, but to yield to no one in the heartiness of our commendation and in the thoroughness of our recognition. Moreover, it is the rule of the REVIEW OF REVIEWS, in its sketches of the life and work of distinguished personalities, to represent the subjects of these articles with sympathy, and as they appear at their best to those who appreciate and understand them. There was certainly no intention upon the part of the REVIEW OF REVIEWS that this rule should be disregarded in an article treating of the Red Cross movement, and of the life-work of Miss Clara Barton, who represents the American wing of that great international cause. It was therefore with no little surprise and pain that we have received, since the publication of the sketch in our March number, several letters from gentlemen well qualified to speak for Miss Barton, declaring that from her point of view and from theirs the article was of unfriendly tone, while in its biographical details it was inaccurate at points which Miss Barton would consider serious rather than trivial. Among these letters was one from Judge Sheldon, of New Haven, which we are assured represents the feeling of those most closely associated with Miss Barton and her work. Whatever other reputation the REVIEW OF REVIEWS may have earned, we believe it has won a name for the qualities of frankness, fairness and courtesy; and it will cling with no little jealousy and solicitude to its good character in these regards. It seems to us that these qualities would require the publication of Judge Sheldon's letter; and we herewith print it without grudging or hesitation. It is as follows:

To the Editor of the Review of Reviews:

When Archbishop Hare wrote his life of John Sterling he unwittingly did something for the cause of good literature, for justice and for truth: he supplied the motive and made the necessity that some one with really adequate preparation and some knowledge of the subject, and not totally disqualified by temperament and bias, should do the work well that had been done badly. At least so it seemed to stout, bluff Thomas Carlyle, who knew something of the real Sterling and was stirred with indignation, with a deep sense of the injustice, the inadequacy, the utterly false color and atmosphere which the great prelate had thrown around the life and work of his friend; he felt very deeply that whatever were the merits or demerits of that life and work, they did not deserve to be set in a sort of pillory in literature for all time, as the

Archbishop had wittingly or unwittingly left an unhappy victim, whether through his own limitations, through want of information or of sympathy, or of a temporarily sitting man for his work, or by all, was too so important. It seemed to have been a case of literary homicide, perhaps of murder, the taking rather than the writing of a life. It brought out those words of flaming indignation which have often done valiant service since: "It is too bad." "Let a man be honestly forgotten when his life ends, but let him not be mis-remembered in this way." And further he says: "My private thought was how happy it comparatively is for a man of any earnestness of life to have no biography written of him, but to return silently with his small, sorely foiled bit of work to the Supreme Silence who alone can judge of it or him; and not to trouble the *Reviewers* and greater or lesser public with attempting to judge it."

But the work was done, and to Carlyle "it by no means appeared what help or remedy any friend of Sterling's could attempt." At any rate, Carlyle felt literally compelled as a sort of remedy to take up the whole matter sympathetically and with some adequate preparation to write a *true* life of Sterling, which has been a great contribution to biographical literature and a great vindication to one to whom it might never have come if the inadequacy, the injustice and the cruelty of his first biographer had been less conspicuous and pronounced.

These suggestions must have been recalled by every one of Clara Barton's innumerable friends in all parts of this country and the world, as the sketch of her life and work in the March number of the REVIEW OF REVIEWS was read. What to do about this last case of biographical murder of a woman worthy at least of some fair and intelligent treatment at the hands of her countrymen appears not altogether plain at first to those who do know something of the facts and the real spirit of her life and work; who recognize in that life and work in the greatest humanest movement of the nineteenth century, one of the truly heroic characters by which that movement has been broadened and made successful and by which a new spirit has been infused into the intercourse of Nations in peace as well as in war, and through which innumerable blessings have been brought to those ready to perish. They know that it was her personal good fortune to have carried through the Conference of Nations in 1884 at Geneva, against much opposition, the proposal to broaden the work of the Red Cross movement from activity in the calamities of war to activity in all the greater calamities of peace, widely known as "the American amendment" and in pursuance of which she is now carrying on in the Sea Islands of South Carolina one of the greatest works by which the Red Cross movement has anywhere ever been illustrated and practically carried out. And while she is doing this important work this unfortunate sketch appears that cripples the movement, hinders her work and does her fearful injustice.

It does not help to say that this was not the intent and spirit of that sketch; perhaps it was not. The effect of it, so far as it has any, is felt as detrimental and all that her friends now ask is that you will not in the future be

even an unconscious helper in a work so injurious; and announce that a *true* biography of Clara Barton and an adequate history of the Red Cross movement, particularly in the United States, will be forthcoming at an early day.

Such a work would fitly crown the great services which she has rendered to her day and generation—services which are and long will be held in grateful and loving remembrance by millions of her own countrymen and millions in all the forty-four nations now ranged beneath the banner of the Red Cross, and by those future generations which she will thus reach and bless by an influence evidently destined to spread and deepen as it flows down the stream of time.

Indeed it seems to make imperative now what her friends have been long urging upon her, the necessity that she herself shall write and publish an autobiography while yet the day of her great and useful life, now westering to its close, has not wholly gone. For that last crowning work of her life may her health and life be spared. No other can possibly be so important for her to undertake and to carry out as she alone can do it.

JOSEPH SHELDON.

NEW HAVEN, April 12, 1894.

By direct inquiry we have become satisfied that the article to which Judge Sheldon objects so strongly contained various specific inaccuracies; and in no quarter will the authentic biography be more heartily welcomed than by the REVIEW OF REVIEWS, which is glad to have the privilege of making the first announcement that Miss Barton will, within a few weeks, set to work seriously upon its preparation. We must, however, be permitted in the most explicit manner to exonerate the writer who prepared the article upon the Red Cross movement in our March number from any intentional errors, either of statement or of inference. The great work under Miss Barton's direction, in the name of the Red Cross, that was in progress on the Sea Islands off the Carolina coast gave peculiar timeliness to the topic; and the REVIEW OF REVIEWS in its perhaps too impetuous desire to publish an article without delay, could give only the briefest time for preparation. We had supposed that many biographical details regarding Miss Barton's life and career which have at different times found their way into print were to be accepted as authentic facts of history. The article in question did not purport to be based upon interviews with Miss Barton,—this direct and preferable source of authentic knowledge being precluded by the circumstance that Miss Barton was wholly absorbed in her arduous

labors among the destitute negroes of the Sea Islands. The fact that errors in the REVIEW OF REVIEWS article were copied in good faith from printed sources does not make them any less erroneous.

The whole episode illustrates the importance of the collection of autobiographical data by men and women who have been the makers of history, and whose careers must of necessity possess both interest and profitable instruction for posterity. Miss Clara Barton's name will stand in our annals as that of a great American heroine. She has wrought through a period of years longer by far than that which is usually allotted to those who take leading parts in the world's hardest conflicts. She was a pioneer in the cause of free schools and elementary education before the war. During the years of our civil conflict she labored unremittingly for the relief of sick and wounded soldiers, and won the undying gratitude of the nation. In the Franco-German war her services brought not only great honors to herself, but also enhanced reputation and respect to the country she represented. And in the international organization of the Red Cross work her participation, as Judge Sheldon truly states, has been of the highest value and consequence. She has worked effectively in the cause of penal reform; and as the Executive head for life of the American Red Cross (the official existence of which is due to her efforts at Washington), she has subsequently spent the strength of her maturer and advancing years as an angel of relief upon many fields of appalling calamity. It is fully within bounds to say that there is no surviving American of either sex whose autobiography, if fully given, would constitute so thrilling and so fascinating a narrative as that of Miss Clara Barton. We join, therefore, most sincerely with our friend Judge Sheldon in the hope that Miss Barton's life and strength may be spared for the preparation of this important and desirable book. Meanwhile, as we have learned directly from Miss Barton, the month of May promises to witness the end of the great emergency relief work that she has been superintending from Red Cross headquarters at Beaufort, South Carolina. The early "truck" crops are maturing in that region, and a kindly climate is now rapidly coming to the rescue of an heroic band of Red Cross workers whose efforts must otherwise soon have made them all fit for nothing but a long course of hospital treatment.

LEADING ARTICLES OF THE MONTH.

HISTORY AND DEMOCRACY.

"**H**ISTORY from a Democratic Standpoint" is the title of an exceedingly able and scholarly article in *University Extension* by Jesse Macy, Professor of Political Economy and Constitutional History in Iowa College, Grinnell, Iowa. Instruction in history and its study, says Professor Macy, have very materially changed with the development and the more complete realization of democratic institutions. Ancient or classical histories are mainly false histories in that they give the beginning students false notions of the life of those times. Classical Greek historians described the life and deeds of the aristocracy, of the masters who had leisure to discuss the nature of the ideal, the beautiful and all that was pleasant and best in life, whereas the great majority of the people were slaves and supported them in their idleness and philosophizing. We study the euphemisms of Greek life, not its wretched realities. From Palestine, however, we get history and literature of a different sort, namely, the plain unvarnished truth about the wickedness of the people, the follies of the kings and the calamities which come upon them because of their vicious, Pharisaical life. Modern nations have professed to follow the teachings from Palestine, and yet the notions of Greece have got woven into our social fabric. No one now dares profess utter indifference to the sufferings of the masses, of the laboring people, as was natural to a Greek.

THE DEMOCRACY OF LEARNING.

History and literature nowadays set forth actual conditions, and be the truth good or ill, proclaim it regardless of classes or consequences. "This new reading of history coincides with the sudden and rapid growth of democracy. Among the many signs of its progress, the College Settlement and University Extension are especially significant. These movements originated in the venerable English universities which have been for centuries consecrated to classical learning. Classically educated men have been active in promoting the new learning. These men see that pagan learning is good, but they see that for the founding of a democratic state the New Testament is better. The new learning seeks an intimate acquaintance with all classes of the people. It purposes to give the people the best learning affords. It seeks to establish just relations among men.

HISTORY AND POLITICS.

"The realization of a righteous and orderly democratic state for the human race will involve a reconstruction of history. It does not require a prophet to see that this reconstruction is taking place. A little while ago it was customary in the higher schools to associate history with literature. That is, history was viewed as something to be enjoyed by the cult-

ured classes along with fairy tales and mythology, novels and poetry. Now history is almost universally associated with politics. It is studied not as a thing to be enjoyed, but as a guide to the most serious business of life.

HISTORY OF THE PEOPLE.

"Again, history is ceasing to be presented as the product of a few great men. Of course intelligent men have always known that such a presentation of history was a mere fiction for the accommodation of

PROFESSOR JESSE MACY.

poets and indolent readers. So long as history was written for the delectation of a leisured class it was but natural that it should be made personal, heroic and unreal. This was but a part of the hypocrisies whereby the real history of the people has been concealed from the view of the privileged classes. In the making of the democratic state all this will be changed. In the light of real history, it will be seen more and more clearly that the great man is he who sees most clearly and expresses most perfectly the common opinions and aspirations of his fellow men. It may still be convenient to allow the name of a man to stand for a crisis in history. . . . A recent critic of Mr. Gladstone has compared him to a coach dog, which runs in front of the coach and jumps up,

and thinks he is leading the coach. This was intended to be severe and at the same time funny. Rightly understood it is neither. There is an implied slander upon the coach dog. No one has a right to assert dogmatically that an intelligent dog really thinks himself to be leading the coach when he goes before it. Mr. Gladstone is the greatest statesman of his generation, because at all times, like a trained and faithful coach dog, he has kept himself in sight and in hearing of his charge. No one has any right to say that he has imagined himself to be the source of movement in the State. He has only been on the alert to perceive in what direction God was leading, and has ever been glad to render what services he was able. Others, equally well born, have lost their bearings, because separated from their charge, and have unconsciously become political tramps."

THE TEACHING OF THE CITIZEN.

Sound and comprehensive instruction in history, continues Professor Macy, is more needed in these days because the masses are becoming self-conscious; they are perceiving that it is within their power to direct and control their own political, social and industrial development; and they need the wisdom of past experience and race suffering to assist them in avoiding the evils that our forefathers encountered and in most cases brought upon themselves. Our people must not only try to avoid evils, but they must try to create a just and righteous state which has never before existed. In this new state men will have perfect equality; each man will have an equal opportunity to rise in life, and no class will thrive and prosper at the expense of others, as was the case in olden times. Among the resources of the builders of the new state we have the public schools, public libraries, the political education given at colleges and universities, our national and various State statistical bureaus and the organization known as University Extension. All these unite to instruct the citizen in the science of politics and the art of government by teaching men the actual truths of history.

WHAT "AMERICANISM" MEANS.

MR. THEODORE ROOSEVELT, in the *Forum*, counsels Americans to be true to American ideas.

"It is not only necessary to Americanize the immigrants of foreign birth who settle among us, but it is even more necessary for those among us who are by birth and descent already Americans not to throw away our birthright, and, with incredible and contemptible folly, wander back to bow down before the alien gods whom our forefathers forsook. It is hard to believe that there is any necessity to warn Americans that, when they seek to model themselves on the lines of other civilizations, they make themselves the butts of all right-thinking men; and yet the necessity certainly exists to give this warning to many of our citizens who pride themselves on their standing in the world of art and letters, or, perchance, on what they would style their social leadership in the community."

THE IMMIGRANT'S DUTY.

"So, from his own standpoint, it is beyond all question the wise thing for the immigrant to become thoroughly Americanized. Moreover, from our standpoint, we have a right to demand it. We freely extend the hand of welcome and of good-fellowship to every man, no matter what his creed or birthplace, who comes here honestly intent on becoming a good United States citizen like the rest of us; but we have a right, and it is our duty, to demand that he shall indeed become so, and shall not confuse the issues with which we are struggling by introducing among us Old World quarrels and prejudices. There are certain ideas which he must give up. For instance, he must learn that American life is incompatible with the existence of any form of anarchy, or, indeed, of any secret society having murder for its aim, whether at home or abroad; and he must learn that we exact full religious toleration and a complete separation of Church and State. Moreover, he must not bring in his Old World race and national antipathies, but must merge them into love for our common country, and must take pride in the things which we all take pride in. He must reverence only our flag; not only must it come first, but no other flag should ever come second. He must learn to celebrate Washington's birthday rather than that of the Queen or Kaiser, and the Fourth of July instead of St. Patrick's Day. Our political and social questions must be settled on their own merits and not complicated by quarrels between England and Ireland, or France and Germany, with which we have nothing to do; it is an outrage to fight an American political campaign with reference to questions of European politics. Above all, the immigrant must learn to talk and think and be United States."

DOWN WITH KNOW-NOTHINGISM.

"But I wish to be distinctly understood on one point. Americanism is a question of spirit, convictions and purpose, not of creed or birthplace. The politician who bids for the Irish or German vote, or the Irishman or German who votes as an Irishman or German, is despicable, for all citizens of this commonwealth should vote solely as Americans; but he is not a whit less despicable than the voter who votes against a good American merely because that American happens to have been born in Ireland or Germany. Know-nothingism in any form is as utterly un-American as foreignism. It is a base outrage to oppose a man because of his religion or birthplace, and all good citizens will hold any such effort in abhorrence. A Scandinavian, a German or an Irishman who has really become an American has the right to stand on exactly the same footing as any native-born citizen in the land, and is just as much entitled to the friendship and support, social and political, of his neighbors. Among the men with whom I have been thrown in close personal contact socially and who have been among my staunchest friends and allies politically, are not a few Americans who happen to have been born on the other side of the water, in Germany, Ireland, Scandinavia, and I know no better men in the ranks of our native-born citizens."

OUR COMMON CAUSE.

"We Americans can only do our allotted task well, if we face it steadily and bravely, seeing but not fearing the dangers. Above all, we must stand shoulder to shoulder, not asking as to the ancestry or creed of our comrades, but only demanding that they be in very truth Americans, and that we all work together, heart, hand and head, for the honor and the greatness of our common country."

THE SUNDAY SCHOOL MOVEMENT OF TO-DAY.

THE Rev. Edward T. Bromfield, D.D., presents in the *Presbyterian and Reformed Review* some interesting facts relating to the recent growth of Sunday schools throughout the world. There are, he says, over 22,000,000 persons—teachers and scholars—enrolled as members of Protestant Sunday schools in different parts of the world. Nearly half of these are in the United States—more than one-sixth of our population, while 88 per cent. of the entire number speak the English language or are domiciled in English-speaking countries.

IN EUROPE.

"According to a statement made at the World's Sunday School Convention, held last autumn at St. Louis, there are now 25,099 Sunday schools, 81,950 teachers and 1,635,000 scholars in the different continental nations of Europe—a gain since 1889 of 500,000 scholars. Some of this gain, it is true, may be more apparent than real, owing to increasing thoroughness in statistical work, but there is no reason to question the substantial accuracy of the figures. There are now, as was also stated at the convention, twenty-one organizers at work in continental Europe, each a native of the land in which he labors and thoroughly trained to the Sunday school method, so that even greater results may be expected in the future than are here recorded.

PROTESTANT AND CATHOLIC.

"Of the nineteen or more nationalities of Europe, five are staunchly Roman Catholic. In three of these—Italy, Spain and Portugal—the cause seems to have declined. In the other two—France and Austria—important gains have been made. In Germany, with a population 35 per cent. Roman Catholic, the advance has been very gratifying. Germany is credited with sending a rationalistic spirit to Great Britain and America; in return these are giving her Sunday schools and winning her children to the evangelical faith. Although Germany has a very large Protestant population, she has not heretofore taken kindly to the Sunday school. The Protestant pastors, it is true, catechise the young people of their flocks, but from the time of confirmation onward through life the average German Protestant neglects both Bible and church, and Sunday schools have been few and far between. In 1874 there were in the whole of Germany 1,218 schools and 86,418 teachers and scholars, with a Protestant population of about 26,000,000. The returns for 1893 show 5,900 schools and 784,769 teach-

ers and scholars, an average weekly gain since 1889 of no less than seventeen schools and 2,244 teachers and scholars. The increase in population has been 12 per cent. and in Sunday school membership 81.9 per cent. The following table gives the Roman Catholic and Protestant population, Sunday school membership—teachers and scholars—for 1889 and 1893, percentage of increase during that period and ratio to the entire Sunday school membership of the world. I have taken the populations from "Mulhall's Dictionary" for 1892. Perhaps 2½ per cent. might be added in most cases. I have not quoted the Greek Church and Jewish population. The Sabbath school statistics are those of the World's Convention of 1893. The total membership, teachers and scholars, the world over, is 22,508,661. The reader will notice that throughout this paper I use the terms Sabbath school and Sunday school synonymously, usage differing among the churches on this point.

	R. C. POP.	PROT. POP.	PROT. S. S. MEM- BERSHIP.		INCREASE, PER CENT.	RATIO TO WHOLE MEM- BERSHIP, PER CENT.
			1889.	1893.		
United States	9,000,000	50,890,000	9,890,471	11,024,371	12.5	49.6
Canada	1,752,000	2,475,000	550,229	624,370	17.7	2.7
Great Britain	1,384,000	29,398,000	7,061,454	7,319,848	3.6	32.5
Ireland	3,952,000	1,169,000	338,231	336,256	...	1.5
France	29,202,000	695,000	53,110	63,800	2.0	.3
Germany	16,769,000	29,370,000	431,221	784,769	81.9	3.4
Russia	8,300,000	2,950,000	6,445	16,301	152.9	.8
Finland	1,000	2,000,000	...	158,6687
Austria	20,227,000	400,000	4,831	7,708	59.5	.3
Italy	28,360,000	62,000	13,410	11,6235
Sweden	1,000	4,561,000	238,082	259,350	8.9	1.2
Norway	500	1,806,500	27,190	68,370	151.8	.3
Denmark	5,000	1,973,000	37,000	58,359	57.7	.2
Holland	1,440,000	2,490,000	157,676	167,600	6.2	.7
Belgium	6,016,000	10,000	2,542	4,422	74.7	.2
Switzerland	1,190,000	1,704,000	89,459	120,298	34.4	.6
Greece	14,000	1,000	...	187
Turkey in Europe	280,000	45,000	...	1,739
Spain	17,542,000	7,600	8,400	3,4101
Portugal	4,707,500	500	2,100	1,122

"The above table will bear very close study. The Protestant population of continental Europe at the present time is in the neighborhood of 50,000,000, about equal to the Protestant population of the United States. In the matter of Sabbath schools, however, Europe is deplorably behind, having only about 8 per cent. of the entire Sabbath school membership of the world, while the United States has 49 per cent., and Great Britain, with a Protestant population of less than 30,000,000, has a percentage of 32.5. This 8 per cent. in the continent of Europe represents, however, an actual gain in Sunday school membership during the past four years of about 50 per cent., the ratio of increase in Germany being 81.9 per cent. and in Russia and Norway over 150 per cent." Schools are also reported as growing rapidly in India, China and Japan.

The International Sunday School Convention, an American and Canadian institution working in union with the World's Convention, and in close alliance with the London Sunday School Union in its foreign work, represents a great movement in the Church. "It was born some twenty-five years ago of the restless desire in the hearts of multitudes of Sunday school workers for interdenominational fellowship in their struggle for improvement and increased spiritual fervor. The convention meets every three years, elects officers, listens to papers and discussions, passes resolutions, levies assessments on State conventions, authorizes special subscriptions for well-defined purposes, and then adjourns for three years, leaving its affairs to be managed meanwhile by an Executive Committee. Representation in the International Convention is by delegation, on a well-defined scale, from State and Provincial conventions, the latter growing out of county and township organizations. There are 1,768 county conventions among the 2,712 counties comprised in the fifty-one States and Territories of the United States. A field superintendent and two or three normal instructors are permanently employed by the Executive Committee. About twenty States sustain as many State superintendents, who give their whole time to field work. Others employ similar agents, male and female, for portions of their time. In all, between thirty and forty efficient organizers and agents are more or less regularly engaged. These persons travel extensively, visiting and organizing conventions, establishing normal institutes, encouraging churches and individuals to establish Sabbath schools, and doing all in their power to promote the interests of such schools from an interdenominational point of view. The organization, as a whole, forms a great statistical bureau, and its labors in this respect have earned for it a deserved reputation."

SELECTION OF LESSONS.

"The one work, however, of all others which has made the International Convention famous has been the preparation of the International Sunday School Lessons—a series of selected passages from the Bible. Resolutions in favor of this plan were adopted after long discussion at the convention which met in Indianapolis in 1872, and a committee was appointed to carry those resolutions into effect. The committee chose corresponding members in England, and, thus re-enforced, proceeded to map out a seven-years' course of Bible study. This system of lessons, although much criticised, has become exceedingly popular, has been adopted by all the leading Protestant Churches in Great Britain and America, except the Church of England and her sister communions, and is used in all the schools affiliated with the World's Convention. The Lesson Committee in announcing the fourth course say: 'We have never supposed this to be the ideal way of studying the Bible, but in our Sunday schools we have few ideal teachers and scholars. Our aim has been to reach the average wants and capabilities of those for whom we have labored.'"

MGR. SATOLLI ON THE PAPACY.

ACCORDING to promise, Mgr. Satolli replies in the *International Journal of Ethics* for April to Signor Mariano's article in the January number on "Italy and the Papacy." The significance of his reply lies not so much in his polemic against the Neapolitan professor, as in the statement of Papal policy which he makes; for Archbishop Satolli, the Papal Delegate to America, is deep in the counsels of the present Pope, and has himself been thought of as possible heir to the triple crown.

WHY CATHOLICISM IS "EXTERNAL" AND SENSUOUS.

He indignantly repels the professor's assertion that Catholicism is "a religion of externals," or a "mechanical function." The chief aim of Catholicism is to promote the "inward spiritual life;" but the form of worship which makes religion a purely interior function will only do for "flesh freespirts," or "persons who are all intellect." "The great majority of mankind, being composites of soul and body, have to learn of things divine through the medium of sense, and naturally translate their religious feelings into outward act. This would be the case even if the original balance between spirit and organism had never been disturbed. In the actual state of things, which makes the control of passion an essential function of religion, external forms are all the more necessary. Eye and ear become the channels of temptation and corruption, and it is only through the senses that images of a higher sort can be awakened, nobler aspirations aroused, and virtuous action secured. Such notions . . . are amply verified in the history of Protestantism, the positive forms of which are coming back to ritual and liturgical observance.

The granting of indulgences, continues Mgr. Satolli, presupposes the forgiveness of sin and obliges the penitent to good works. Prayer, fasting, alms are meritorious only if inspired by faith and sanctified by grace. The honor—not adoration—paid to saints is subordinate to the worship of God, and only glorifies Him through His higher works. The veneration of images and relics proceeds from the most natural of impulses, and is intended for the originals, of which these things are but reminders. The moral and religious depression of Italy springs not from the Church, but from other influences—notably the Rationalistic movement which began in England last century. The true solution is not Protestantism or Rationalism, but a revival of Catholic faith and practices.

THE POPE'S INTERNATIONALIZATION NECESSARY.

The reinstatement of the temporal sovereignty of the Pope is an international necessity, which the writer illustrates by the position of Egypt, Belgium and the District of Columbia with its exceptional conditions. As the subject of any one State, the Pope must be the object of suspicion or alarm either to that State or to other States. Still more, as head of the Catholic Church, must the Pope be independent of all human authority. "Conversely, his reinstatement

ment, while satisfying a well-founded claim and bettering the condition of the Church, would be highly profitable to Italy. Without the least prejudice to the real unity of the nation, without any diminution of national power or hindrance to lawful aspirations, it would bring about domestic peace and improve foreign relations.

“OUTSIDE THE CHURCH NO SALVATION.”

After defending the Pope's ecclesiastical activity and the philosophy of Thomas Aquinas, which he describes as “essentially the philosophy of Aristotle,” the writer thus “states the Catholic doctrine” on the necessity of Church to salvation: “Christ founded a Church and intrusted to her the means of salvation; hence, objectively speaking and in general, the necessity of belonging to that Church. Those who recognize this fact, yet refuse to enter the Church, evidently deprive themselves of the means of salvation, besides disobeying the ordinance of God. Those who remain outside the Church because they are convinced that their own religion is the true one, possess the means of salvation in an imperfect manner, or perhaps not at all. Should they be lost, it will not be because they were non-Catholics, but on account of the sins they have committed. Such is the meaning of the proposition *extra Ecclesiam nulla salus*. It is, however, to be noted that, while the Church maintains this doctrine as to the conditions fixed by Christ for salvation, she forbids us to pass sentence upon the lot of any one who is called from this life, declaring that the destiny of every man is a question for God's judgment alone.”

To the charge of luxury among the higher clergy and destitution among the lower, the writer answers: “In our day luxury is unknown in the Church . . . and the expenses of the Vatican have been reduced to a minimum.” It is the government which pays the lower clergy such miserable pifflances.

THE ALLIANCES WHICH LEO WOULD FAVOR.

Against the accusation that the papacy connects itself with now the Triple Alliance and now the Franco-Russian alliance, Mgr. Satolli observes: “The alliances which Leo XIII would favor and support are of a far different character—more pacific and more conducive to civilization. He would certainly, if occasion offered, take the initiative toward a European disarmament, and in doing so he would be faithful to the ‘secular traditions of the Roman Church.’ The spirit which brought about the Truce of God, which federated the nations in the Holy Roman Empire, which leagued them in the Crusades against encroaching barbarism, and which made the Court of Rome a court of arbitration for the strong and of appeal for the weak—this spirit lives on in the papacy, and would avail more to-day for the harmonious development of civilized Europe than the millions of soldiery armed to keep peace or the over-zeal of rulers whose protests against war are its real provocation.”

In the union of spiritual and temporal sovereignty “the spiritual would always control.”

The Pope refuses to accept and also to resist with force the condition thrust on him by the Italian government. “He realizes that violence can never beget stability, and desires that the restitution of his temporal domain should be dictated by a sense of equity, freely accepted by the people of Italy, and sanctioned by the other powers.

“THE SOCIAL FORM OF CHRISTIANITY.”

Mgr. Satolli thus sums up the situation: “The very idea of religion is now on trial. But religion in the concrete means Christianity, and the social form of Christianity is Catholicism, and the heart of Catholicism is the papacy. Hence every attack upon the Church and her head is likewise an attack upon Christianity and religion itself. Conversely, all who maintain the religious idea and its Christian form must side with Catholicism and the Pope. Yet how can the papacy accomplish its mission unless, in its own possession, it stands apart from the trammel of secular power, and aloof from the clashing of rival interests?”

THE POPE AND THE HIGHER CRITICISM.

WE have all heard of the boast of a famous lawyer that he could drive a coach-and-six through any or every act of the British Parliament. The *Contemporary Review* shows us this month how a Roman Catholic, avowing the most devoted loyalty to the Holy See, can drive a whole troop of tenets taken from the Higher Criticism through a hostile Papal encyclical. The anonymous author of the article which created a great stir several months ago on “The Policy of the Pope,” returns once more to the charge. He tells how his delight on first hearing that His Holiness intended to deal with the modern problems of Scripture study was dashed on finding that the Sovereign Pontiff was being inspired by *a priori* theologians, the accusers of the very few Catholics competent to pronounce on questions of Biblical criticism.

THE POPE AFFIRMS INERRANCY.

He then gives the text of the encyclical. He says that its rules of guidance in apparent collisions between science and the Bible “are all summed up in Augustine's comprehensive rule . . . that whenever a new fact is discovered by science and so conclusively established that it cannot be called in question, it behooves us to set about proving that it does not run counter to Holy Writ; but if a new scientific proposition be found incompatible with the testimony of the Bible, then it is our bounden duty to demonstrate that it is most false, or if we cannot accomplish this, we must, at least, firmly believe without the shadow of a doubt that it is so.”

But what chafes the writer most is the statement of the Pontiff that “there is no error in the Bible.” For “God is the author of Holy Writ,” to whom the individual writers were as our hands are to our brains; and to deny the inerrancy of Scripture is either to pervert the Catholic doctrine of Inspiration or to accuse God of error.

THE ENCYCLICAL NOT INFALLIBLE.

Whereupon the writer affirms of those who accept the conclusions of the Higher Criticism: "Their first and predominant feeling is of profound relief that a papal encyclical is not a binding definition *ex cathedrâ*, but a document which, while challenging the respect of the least enthusiastic Catholic, is not exempt from the criticism of the most fervent, and that our Church is so marvelously constituted that its Sovereign Pontiff may—like Pope Honorius—confer a much more solemn sanction upon dangerous and damnable errors without in the least compromising her infallibility or forfeiting his own. . . . We may without presumption predicate fallibility of papal writings when they deal with scientific theories and deny verifiable facts."

IS THE POPE IGNORANT?

After a hurried statement of these results of the Higher Criticism the writer alleges that also the "lower" or textual criticism which the Pope approves leads inevitably to conclusions just as far removed from traditional views

The Pope's "reasoning was that of a generous mind which takes a large and sweeping view of a question, unconfused by a knowledge of exact details." Thus politely does the writer declare here what he hints less clearly elsewhere, that the encyclical reveals the Pope's ignorance of the subject in hand.

THE FLIGHT OF INTELLIGENT CATHOLICS.

Thus dramatically he states his case: "All reasonable men admit that there are numerous errors and inconsistencies in the Bible, and all Christians are unanimous in ascribing them to the human authors of the books. 'There are no human authors,' cries our Holy Father. 'God is the sole author of the Bible. He is responsible for the whole, and all its parts.' 'Whom shall we saddle with the errors, then?' ask intelligent Catholics, alarmed. 'You must prove that there are none,' is the reply. 'Well, but Higher Criticism proves the contrary,' we insist. 'Shut your eyes to Higher Criticism, then, and restrict yourselves to text criticism, which is perfectly harmless,' is the rejoinder embodied in the encyclical. Now, it is become clear that text criticism, nay that common sense, reveals these errors and inconsistencies which must of necessity be attributed to God or man, and which the Pope forbids us to ascribe to man. The position of intelligent Catholics is pitiable.

"To sum up. The papal encyclical tends to effect neither more nor less than a revolution in our attitude toward the Bible, without any sufficient cause. In the name of reason, it lands us in a maze of difficulties and contradictions, whence the wit of man is unable to find an issue. In the name of religion, it undermines our sentiment of awe for the Divine attributes, by shifting the burden of error from the shoulders of fallible men, and declaring that we must either deny its existence, or else tax God Himself with

ignorance. And what . . . does our Church gain by the change? It gains nothing and risks everything."

CARDINAL GIBBONS' PERSONAL REMINISCENCES OF THE VATICAN COUNCIL.

THE opening paper of the *North American Review* for April is by His Eminence, Cardinal Gibbons, who relates his personal reminiscences of the Vatican Council which convened in Rome December 8, 1869. The writer himself happened to be the youngest bishop in the Council, and he states that while his youth imposed on him a discreet silence among his elders, he does not remember to have missed a single session and was an attentive listener at all the debates. There were in attendance at this Council 737 prelates. Every continent, every island of importance, every nation on the face of the globe, except Russia, was represented by its hierarchy. Latin was the official language of the Council. In the following paragraphs Cardinal Gibbons explains why this language was exclusively used in the Vatican Council, and is to-day employed in the liturgy of the Western Church: "When Christianity was established, Rome was mistress of the civilized world. Wherever the Roman standard was planted, there also spread the Roman tongue, just as the English language is now diffused wherever the authority of Great Britain or of the United States holds sway. The Church adopted in her public worship the language that she found prevailing among the people. And she has very wisely preserved it in her liturgy, even after it had ceased to be a vulgar tongue, as a dead language is not subject to the gradual changes of meaning which occur in a living tongue. The jewel of faith is best preserved in the casket of an unalterable language."

LATIN AS A UNIVERSAL TONGUE.

"In like manner we can easily perceive the utility, I might say the absolute necessity, of the Latin tongue in the deliberations of the Council. Had the Bishops no uniform medium to express their sentiments, the Council would have degenerated into a Babel of tongues. Public debate would have been impracticable, even familiar conversation during the intervals of recess between the speeches would have been impossible to a great many, for the Bishops' seats were arranged, not by nationality, but by seniority of rank. But, thanks to the Latin language, which all but a few Orientals understood, each Bishop comprehended the discourses almost as clearly as if they had been spoken in his native tongue."

NATIONAL SHIBBOLETHS.

"While the speeches of all the Bishops were intelligible to the hearers, an attentive listener could usually detect to what family of nations the orator belonged. He could tell whether the speaker was a Spaniard, a Frenchman, an Italian, a German, or a prelate of the English-speaking world, almost as

readily as an Englishman can distinguish a Scotchman from a Cockney or a Yorkshireman. The pronunciation or accentuation of certain words, the guttural sound or the soft cadence, was the shibboleth that revealed the nationality of the speaker. Sometimes a pleasant smile would play on the habitually grave countenance of an Italian Cardinal while listening to the language of Cicero uttered with inflection and pronunciation unfamiliar to his ears. The accomplished Bishop of Geneva began a speech with a graceful apology for his French accent: 'My voice, Most Reverend Fathers, is French, but my heart is Roman.'

TROUBLES OF AN ORIENTAL.

Cardinal Gibbons relates an amusing incident of the unsuccessful attempt of one of the Oriental Bishops to express himself in the language of the Council. This Bishop "wrote out his address in his native Arabic, and had it translated into the language of the Council by his Latin secretary. He then read it in a loud monotone, without any regard to accentuation, pronunciation, or punctuation, from beginning to end, without comprehending one word of what he said. And I think that the audience were as much in the dark as the speaker."

AMERICAN PRELATES.

Archbishop Spalding, of Baltimore, and Archbishop Kenrick, of St. Louis, were among the most noteworthy prelates from the United States. Archbishop Spalding was a member of the two most important committees, in which he was busily employed. He delivered but one discourse during the Council. Archbishop Kenrick spoke Latin with admirable ease and elegance. "I observed him day after day," says the Cardinal, "reclining in his seat with half closed eyes, listening attentively to the debates without taking any notes. And yet so tenacious was his memory that, when his turn came to ascend the rostrum, he reviewed the speeches of his colleagues with remarkable fidelity and precision without the aid of manuscript or memoranda."

CARDINAL MANNING.

The most prominent figure among the Episcopate of England was Cardinal Manning. "His emaciated form and ceaseless activity suggested a playful remark made to him in my hearing by Archbishop Spalding: 'I know not how Your Grace can work so much, for you neither eat nor drink nor sleep.' He delivered the longest oration in the Council, and yet it hardly exceeded an hour, which is evidence of the usual brevity of the speeches. The question is commonly put in America: 'How long did he speak?' In Europe they ask: 'What did he say?' Cardinal Manning's discourse was a most logical and persuasive argument, and, like all his utterances, was entirely free from rhetorical ornament and from any effort to arouse the feelings or emotions. It was a Scriptural and historical treatise appealing solely to the intellect and honest convictions of his hearers."

CHRISTIANITY IN INDIA.

MR. VIRCHAND A. GANDHI, of Bombay, who was one of the most prominent representatives at the World's Parliament of Religions, writes in the *Forum* on the subject "Why Christian Missions Have Failed in India." It has been 300 years since Western civilization found a footing in India, and during this time, says the distinguished Hindu, "not a single true Aryan has been converted to the Christian faith." By this he does not mean that there are no native Christians in India, natives who have been educated in the faith. Christian missions have failed in India, he tells us, because the creed and faith were not sufficient for the Hindu, whose philosophy satisfies alike the simplest mind and the intellectual giant. The Aryan philosophy, he further explains, begins where Christianity leaves off. "Christianity ends with the idea of the extra-cosmic creator. The Aryan philosophy started with this idea and soared higher and higher until it lost itself in the essential identity and oneness of the intelligent cosmos. The human mind cannot soar higher."

ARYAN TOLERANCE.

"Christianity boasts of the time-worn saying of the fatherhood of God and the brotherhood of man; but what is this compared with the universal love of the Aryans? Says the Bhagavad Ghita, 'The enlightened look with equal love upon a Brahmin full of learning and righteousness, upon a chandala (the lowest of castes), a cow, an elephant, or a dog.' Other religions teach, Love your neighbor as yourself; the Aryan philosophy teaches, Look upon all as upon yourself. The philosophy of the absolute does not respect caste or creed, color or country, sex or society. It is the religion of pure and absolute love to all, from the tiniest animalcule to the biggest man. Above all, the Aryan philosophy is expressly tolerant of all shades of religion and belief, for it looks upon all the different modes of thought as so many ways to realization of the absolute, devised to suit the capacity of various recipients."

"The Christian might say that there is little difference between the 'Essence that underlies the Universe' and their own God. True, the Essence is one; but the moment you attribute human qualities to this Essence and limit it by human conditions, you diverge from us."

CRITICISM OF CHRISTIANS.

Christianity was universally disagreeable to the Hindu who was educated to the belief that the eating of animal food and the drinking of spirituous liquors were sins, says Mr. Gandhi. "The Christians being meat eaters and wine imbibers, seem to us to represent a religion devoid of humane practices; for, to the mild Hindu, brotherhood does not mean simply the brotherhood of man, but the brotherhood of all living beings. That representatives of nations who fatten and kill for selfish gratification millions of hogs

and steers a day should preach humanity to an already humane community, is beyond the comprehension of the Indian mind. I am not saying that Christianity requires a man to eat animal food, but there is a prevalent opinion in India that a person becomes a Christian simply to gratify his appetite, to eat prohibited food and to drink intoxicating liquor. When a Hindu is seen going into a church, his co-religionists say nothing; but if he is seen going into a grog-shop, his friends say, 'He has turned a Christian.' Indeed, they seem to think that animal food and spirituous liquors are inseparable incidents of Christianity."

The missionaries, it would seem, have done little to disabuse the people of this impression, and have not shaped their course to suit what the Hindus regard as the true idea of humanity. To them it seems strange that Christians, who say they are willing to sacrifice their life for their religion, cannot afford to sacrifice the gratification of their palates. Mr. Gandhi concludes his article with the following eloquent appeal:

A "HEATHEN'S" BOAST.

"They say that we are heathens. Are the people who believe in the eternity of soul, the doctrine of reincarnation, in the law of Karma and universal justice, and who practice the humanity that they preach all the seven days of the week, are they heathens? Or is it the people who say that the soul of man had its beginning in time, but will pass into eternity, meaning thereby that it is eternal at one end without being so at the other (a contradiction in terms); who believe that man was bound down to destiny by the freak of an irresponsible Being—judge and prosecutor at the same time; and who preach brotherhood on Sundays and the rest of the week meet in political cabinets to cut the throats of their weaker brothers, and to grind down poverty-stricken nations simply to enrich themselves? I ask, Is it not these that are heathens? If to believe in one's own deeds as the cause of one's condition; if to depend on one's self for final bliss rather than on a constituted attorney; if to preach and practice humanity toward all sentient beings instead of a small portion of them—if this is heathenism I am proud—doubly and trebly proud—to be called a heathen.

"We may not be able to convert each other, but we can accomplish not a little in promoting tolerance and friendship, and in showing the American people that missions in India are not the phenomenal success that they are represented to be. From what it has been said above it will be apparent that Christian missionaries in India have to encounter insuperable difficulties, and that the labor is wasted labor."

The Hindu Philosophy.

The leading principles of the Hindu philosophy as stated by the Rev. Francis Heyl in the *Missionary Review of the World* are as follows:

"1. The eternity of the soul retrospective and prospective.

"2. The universe is a part of the one eternal soul.

The world is evolved not out of chaos, nor out of gross particles, but out of soul. Hence, matter as well as soul is eternal.

"3. The soul can exist only through the material essence of the body. There are two bodies in connection with every soul—a gross material body and a subtle ethereal body. The soul is also joined to mind as an inlet of thought, but belonging to the body.

"4. The union of soul and body is productive of bondage, because the soul must receive all its impressions through the body, and some are pleasant and others painful. The soul also begins to act under such circumstances, and all action implies responsibility and entails consequences which must be borne.

"5. In order that the consequences of action may be thoroughly worked out, and in order that the soul may be purified from all evil before its absorption into deity, it must pass through numberless existences, entering into a god or a demon or a man, an animal, plant, or even a stone, according to the extent of their merit or demerit.

"6. This transmigration of souls is the source of all evils in the world. All weakness, misfortune, misery, sorrow in the case of any one are the result of actions in a former existence.

"7. In order to obtain relief from the evils that trouble humanity the individual must abstain from all thought, from all consciousness of self or personality. He must return to the condition of soul or absorption into the eternal soul, which latter is the ideal of the Hindu philosopher.

The principles of the Hindu's faith are as follows:

"1. All misery consists in attachment to life. 2. Misery is to be avoided or gotten rid of by renouncing all desire, all self-pleasing. 3. This end is attained: (a) by the observance of good laws; (b) by the practice of discipline. 4. The end of all things is annihilation."

Christian Missions in India.

The Rev. Edward Storrow's article in the *Missionary Review of the World* directly controverts Mr. Gandhi's assertion that Christianity has failed in India. He gives official church statistics showing that there were in India in 1890, 559,661 native Christians, about 190,000 of whom were communicants.

Not every one who professes to believe is received into the Christian church. "Great care is generally taken in receiving applicants for baptism, admitting members into the churches, employing native preachers and receiving any of them into the ministry. The entire community, though relatively small, is better educated, more free, hopeful and aggressive than any other. Their morals, virtue and benevolence are high—higher even than in the general mass of English and American society, though below the level usually recognized in professedly religious circles. There is, indeed, a small class of so-called Christians, usually found in military stations, who bring opprobrium on the name they bear, and are, unfortunately, the only representatives of Christianity their masters

SOLOMON'S SONG.

know or care to know. They are not interested in missions, and the instances are numerous where they have lived for months near considerable communities of native Christians without knowing it, and on their return to England declaring that they had never seen a native Christian station, or that the few Christians there were were the refuse of the bazaars. These no more represent Indian Christianity than the crowds of London and New York represent the piety and morals found in these cities. As a rule, the missionaries are slow and circumspect in receiving converts. They could have myriads if they would condescend to allure them by mercenary motives, or accept all those who apply for baptism. In my opinion they err more on the side of hesitation than of haste. Such as they have are usually received after due waiting and inquiry; they are carefully instructed, and not seldom suffer much in accepting the Christian faith. But what wonder, considering whence they came and what they were, if a residuum of Asiatic, Hindu, and common human defect cleaves to them! But as communities it is a matter of surprise that they have become so free from the superstitions of their ancestors, accepted the great truths of the Gospel, and moved far away from Hindu customs and opinions toward the New Testament standard of belief and life. The facts I have given speak for themselves; but they could be sustained by any amount of independent testimony. The *London Times* correspondent, for instance, recently wrote, 'The status of the native Church is rising every year; so also are the character and acquirements of the agents.' And again, on January 24, last year, 'The Decennial Missionary Conference, held in Bombay, had a surprising record to show of the result of missionary work. During the past nine years with which it deals extraordinary progress is disclosed in every department of evangelistic labor.'

NATIVE TESTIMONY.

"Native testimony has a value of its own, since it expresses the opinions of keen observers and prejudiced if not hostile critics; but since the time of Raja Rammohun Roy, with increasing volume and strength it has borne witness to the zeal, courage and benevolence of the missionaries and the greatness of the changes which are now with ever-increasing force passing over Hindu society in every direction; and although native vanity and prejudice are reluctant to praise what is foreign, the conviction is very general that old things are passing away, that all the old native religions are decaying, that Christianity is the great root-cause of their decay, and that it is growing in numbers, prestige, influence and power as no other religion. This is not only the testimony—I might add, the lament of the thoughtful—but 'the common talk of the bazaars.' Recently, in Calcutta, Dr. Pentecost asked a dignified old man if he were a Christian. 'No, sir,' was his reply. 'I am a Hindu, and a Hindu I expect to die; yet I am deeply interested in Christian progress in this land, for I see that Christianity is surely coming.'"

"TILSKUEREN" has an interesting article by Georg Brandes, entitled "The Song of Songs." According to Brandes, the vivid love-song has been preserved to posterity rather by reason of its having been as ordinary and natural in the old Hebrew days as sunshine, than because it was thought at the time to be worthy of any exceptional note. It was only toward the time of Jesus that its beauty was heeded, and that the idea occurred of saving it from oblivion by including it in the Scriptures, and, for this reason, it was obviously necessary that some allegorical meaning should be attached to it which would make it permissible to place it amongst the sacred books. Furthermore, allegorical interpretation was an art of the times. Theophilus of Antioch likened, in the second century, the tree of Lebanon, whereof Solomon made himself a bed, to Ruth, in whose lap lay hidden the whole of David's race, and the bed to "the souls who bear God within them." It was in the third century that Origenes gave the first entirely allegorical meaning to the love-song, and in this only the Divine love is expressed, and the song is the bridal song between the Church and her heavenly Bridegroom. From that time forward the only meaning not attributed to the song was the literal one. This, however, is merely by the way, few nowadays accepting the religious interpretation heading the chapters of the Song in the Book, and the interest of Brandes' article lying therefore chiefly in the theory he advances that the Song is neither pure lyric nor drama, but a quaint erotic song-play written to be performed with pantomime and dance. It comprises solos, duets, and chorus.

PRECEDENCE OF SONG.

Poetry, Brandes remarks by way of preface, is, amongst all races of humanity, of greater age than prose, and poetry has sprung from song. We sang, not only before we wrote, but before we spoke. Dance and song are twin-born—rhythmically united; spelling corresponds with step. Our forebears in all probability gave vent to musical sounds long before they had any intelligible language. Darwin discovers the source of language in the calls which both sexes of many animal species make when the male is seeking to win or allure his mate, and remarks that the use of the vocal organs is therefore associated with the highest ecstasy which it is in the power of the animal to know. Here, says Brandes, is the source of the oldest poetry. The first step to speech was the mention of that which had called forth pleasure and attraction. "How lovely thou art, oh beloved!" That, or something similar, is the oldest lyric. If the erotic fancy now wins artistic expression by means of song and dance, it gives rise to an imagined ecstasy in lieu of the real. The ancient bridal dances of Syria were naïve; the Hymeneals of the Greeks were coarse or delicate imitations of the art; and the unbridled erotic dances of the Asians, the Egyptians and the North Africans all belong to the same class. The Hebrews were especially a singing people. They sang

their triumph over their enemies, as instance their brief wild triumph song, "Woe to thee, Moab! thou art undone, O people of Chemosh." Did they discover a new well, they sang to their discovery: "Spring up, spring up, spring up, oh well! Sing ye to it! The well that is digged of princes!"

THE MEANING OF SOLOMON'S SONG.

Solomon's song opens with a chorus—several women singing to a man—an Oriental harem-like tone over the whole: "Let him kiss me with the kisses of his mouth. . . . The upright love thee." Then steps forward the chief soloist and sings, "I am black but comely, oh, ye daughters of Jerusalem!" After her solo comes a dialogue. "Tell me, O thou whom my soul loveth," she asks, "where thou feedest?" In the answer is the touch of raillery. "If thou know not, oh thou fairest of women, go thy way forth by the footsteps of the flock," etc. The reply means plainly, "Wherefore this innocence? Well enough thou knowest where thy lover is!" Next comes an erotic duet of the old time style of which the *Carmen amœbæum* of Horace is a sample. It is sung by the lovers. "His left hand is under my head and his right hand doth embrace me." Here clearly the pantomime comes in. He suits the action to her words. She swoons in a spasm of ecstasy in his embrace, and this tableau forms the central idea of the dance and accompanying song. He turns then to the chorus and sings, "I charge you, oh ye daughters of Jerusalem, that ye stir not up nor awake my love till she please!" Georg Brandes' article is a very lengthy one, and his theory can only be given in outline here.

Origin of Solomon's Song.

The origin of the "Song of Solomon," according to Karl Budde, in the *New World* for March, is suggested by the fact that in Syria "the king's week" is the name given to the first week of married life, during which bridegroom and bride play king and queen. The Song of Songs is, he concludes, a collection (compiled about 300 B.C.) of songs for marriage festivals, in which the bridegroom king is hyperbolically designated Solomon. Budde pleads for an expurgated Bible for the use of minors and others, which shall omit the Song of Songs and all else likely to give decided offense. He quotes the Glarus family Bible as an example in point.

MR. LABOUCHERE is the subject of a character sketch in the *Ludgate Monthly*. He is described as one of the most original men of our time. Even his faults are picturesque. "Of late Mr. Labouchere has, in politics, taken himself a little too seriously to be consistent with the lines which he originally laid down for himself. Years ago he treated life with a genial cynicism that made the world an amusing study to him and gave to his own work and conversation a curious and unusual interest. But the shadow of the Grand Old Man has fallen upon him in these latter days and has modified his attitude of general indifference."

MR. CLEVELAND'S "FAILURE."

"AN INDEPENDENT" writes in the *Forum* on the subject, "Mr. Cleveland's Failure,"—with a question mark after "failure,"—setting forth in plain language what he regards as the serious mistakes of the first year of the present Administration, and indicating the extent to which Mr. Cleveland appears to be responsible for them.

MARCH 4, 1893.

We summarize as follows the writer's story of the "failure:" Mr. Cleveland went into office with a clear purpose—free from personal, factional, or sectional obligations. As he stated, himself, many times, he owed his election to no one, but to the whole people. It was his second term of office. He was relieved forever of the temptation, which no President during his first term has withstood, of shaping his conduct for a re-election. He had had experience in the office; and, better yet, he had had the benefit for four years, after his own presidential experience, of observing the mistakes of another President.

MARCH 4, 1894.

This was but a year ago. "If a national election were to be held to-morrow no shrewd observer doubts that the Democrats would be defeated in every Northern State and perhaps in more than one Southern State."

What has happened within a year to bring about so great a change? In the "Independent's" opinion, Mr. Cleveland himself was largely responsible for this change. "At the very outset a singular weakness of the President displayed itself. Mr. Cleveland is remarkably strong as the leader of a great party in the opposition. He is not correspondingly strong as the Executive of a victorious party. In one rôle he is heroic, in the other commonplace. He deals masterfully with men in large masses; ineffectually with individuals. Throughout his career he has stood firm, for instance, in his declarations, and no doubt in his purpose, in favor of civil-service reform, but over and over again he has selected men who have put his principles to shame. Surely he has stood unflinchingly for tariff reform. But he has been unable to win the loyalty of many of the leaders of his party as he won the loyalty of the party itself.* On the side of sound finance he has been immovable. But almost within his own household the old heresy of fiat money has lurked, and an unsound financial measure has been passed by his own party. At the very beginning, therefore, when Mr. Cleveland came to deal with men as individuals, he began to dampen the popular enthusiasm that he had aroused—a popular enthusiasm so strong that it might have been trusted, if used aright, to smother his enemies forever."

THE FIRST MISTAKE.

It was because of Mr. Cleveland's long-sighted courage in boldly committing himself to the policy of a radical tariff reform in his first term that he was

elected President the second time. The election was an emphatic command of the people to reduce the tariff and rid it of its protective features. "If this was not so the popular vote has no meaning. If this was not what the people meant, they can never mean anything by the 'popular vote.'" When, however, Mr. Cleveland took office on March 4, 1893, instead of at once calling Congress in extraordinary session to set about the work of revising the tariff, he began to busy himself with making appointments, and while the Administration was thus getting itself organized, an opportunity was given the enemies of tariff reform who had been retired during the campaign, to take new courage and make new effort. In giving them this opportunity was the beginning of the end of Mr. Cleveland's first mistake.

THEN CAME THE COMMERCIAL DISASTER.

Then the summer, big with approaching commercial disaster, came on. "And commercial disaster following the Administration's delay muddled many a man whose head had before been clear. Every rural member of Congress who had ever dallied with fiat money now embraced it; so that when the President was obliged to call Congress in extraordinary session to repeal the silver purchase clause of the act of 1890, a Congress assembled that had forgotten for the time its duty to reform the tariff, but was secretly in favor of free silver. No popular enthusiasm could withstand this revelation.

To the credit of Mr. Cleveland, with almost insurmountable difficulties in the way, he forced the repeal of the purchase clause of the silver act, and in rendering this service he made "a chapter in our history that may be recalled after all actors in it are forgotten."

A TARDY TARIFF MESSAGE.

Only when the silver purchase law had been repealed did Mr. Cleveland turn his attention to tariff reform, and his message on that subject contained the same ring as his more famous message of 1887. "But the popular enthusiasm was gone, partly because there was the absurdity in intrusting the reformation of the tariff to a Congress that was in favor of an unsound currency, but partly also because of a very general desire that nothing further should be done to create uncertainty in the commercial and industrial world."

HAWAIIAN DIFFICULTY AND CONSULAR APPOINTMENTS.

In the Hawaiian difficulty, which in the meantime had grown into prominence, Mr. Cleveland, "while right in his contention, chose the wrong man for a delicate task, and the prevalent feeling everywhere to-day is that the Hawaiian affair was awkwardly managed."

As regards our foreign service in general, "there have, of course, been not a few good appointments; but all around the world at our consular posts are men that were selected by a most infelicitous reformer because they were unfit."

THE SECOND SERIOUS MISTAKE.

Mr. Cleveland's second grievous mistake was in permitting his old enemies in New York, the 'Democratic machine,' to continue to dominate the party, or at least to have good hope of doing so." The writer does not contend that it is the duty of the President of the United States to concern himself with local party troubles. "But when there is such a party burden as is sure to wreck his party and to thwart the very purpose of its existence, if he do not pay heed to it, how can he expect to have his party do any high duty?" The cause of tariff reform, the cause of civil-service reform, the dignity, integrity, and cleanliness, the very existence, in fact, of the Democratic party, require its emancipation from the New York State machine. Mr. Cleveland could have done much more than he has done to accomplish this emancipation. Every triumph that he has won has been won by reason of his hostility to this machine and by reason of the popular hope of his continued hostility. It is not a mere local factional fight. It is a struggle to the death. If Hill and Murphy and their like are the Democratic party, the Democratic party cannot survive. No man can doubt this except the man who doubts the success of our whole system of popular government. Within the last twelve months the tone of the Democratic party has slid down from the level of the heroic mood of the whole people to the level of the New York machine, which is to-day giving its influence to the protectionists in the Senate in return for votes that have been given to punish Mr. Cleveland.

COMMONPLACE AS AN EXECUTIVE.

"Mr. Cleveland's achievement in bringing a long discredited party into power and up to the level of a great expectation was herculean. Its sliding back in one year was to a degree inevitable, but it has gone backward to a greater degree than could have been predicted—in great measure surely by reason of his two chief mistakes, his tardiness in getting to the actual work of tariff reform and his neglect of the state of politics in New York. He has proven himself a very great leader in a large struggle for supremacy; but in the work of doing the task that he himself formulated he cannot even choose good tools. He lacks imagination. He is a plodding man. He cannot see dramatic effects. He cannot play the game of statecraft when the time comes for him to move men on the board. He cannot measure the effect of individualities on public opinion. He is like Jefferson in his clear discernment of great principles and in his knowledge just when to proclaim them with supreme effect. But he has almost the stolid density of his immediate predecessor when he comes to the task of working them out. Not the least instructive lesson of Lincoln's career is that a really great Executive must be a man of imagination, even of humor, if possible a man also of personal charm. These qualities of imagination and personal 'magnetism' have in our own time carried through a long political career, brilliant if empty, a man who had no principles whatever. These qualities are by no means substitutes for

the sterling virtues that Mr. Cleveland has. But they are necessary qualities nevertheless for a great President. It is a very proper demand that a democracy makes, that its enthusiasm shall be kept aglow even while its most tedious tasks are in hand. Else at best a President or a party becomes but a poor drudge. In a hand-to-hand encounter Mr. Cleveland's enemies get the better of him—the same enemies that on a larger field he has time and again utterly routed. When the President becomes a drudge, so commonplace becomes even the high duty of the hour that popular enthusiasm wanes and the sorriest rogue can for a time play the rôle of a hero. So strut now Hill and Gorman. To this extent the President has failed.

"But this much can be said of Mr. Cleveland," concludes the writer. "He is the only man in our public life who has made a chapter in our political history that men of the next generation will recall;" and he adds: "Mr. Cleveland has time before his final retirement to show whether he has the same mastery as an executive as he has as a political leader."

COMPARISON OF THE VOTES ON THE M'KINLEY AND WILSON BILLS.

MR. WILLIAM HILL gives in the *Journal of Political Economy* an analysis of the vote on the Wilson bill taken in the House of Representatives, with reference to the sectional distribution of votes on the McKinley bill in 1890. "The South was practically solid for the bill, only eight votes being cast against and one hundred for it. Of the eight negative votes, four came from Louisiana, one each from North Carolina, South Carolina, Tennessee and Kentucky. This is seven votes less than the South gave for the McKinley bill, while the vote in the South against the McKinley bill was only half as large as that cast for the present measure. But the number of members voting now is more than 100 in excess of those recorded on the bill of 1890.

"Without the South the majority against the bill would be twenty-seven; on the same basis, the majority for protection three years ago was 104. Aside from New England, New York and Pennsylvania and the far Western States no section shows a majority against the bill. New England opposed it by a vote of nineteen to six, an apparent loss of three votes from the protective side as compared with the vote of 1890. Two of the three, however, were voting against the income tax rather than against protection. From New York a majority of thirteen opposed the bill, but as eight of the negative votes had just been recorded against the income tax amendment, New York would probably have supported the bill on the tariff question alone. Pennsylvania voted more than two to one against the bill, but New Jersey gave a majority in its favor.

"Of the Middle States, Ohio and Illinois were equally divided, both showing a great loss to protection since the McKinley bill was voted upon. The free wool clause does not appear to have frightened

the representatives from the great wool growing States. Ohio, Michigan, Texas, California and Montana, the leading wool producing States, gave thirty votes against protection to twenty-two for it. In 1890 they voted twenty-six to twelve for the McKinley bill. Without Texas the present vote stands twenty-two votes against the bill to eighteen in its favor. The same States supported protection in 1890 by a vote of twenty-six to four.

"If all the States from New York and Maryland to the Mississippi river be taken the vote stands seventy-six in favor to seventy-eight against the bill. If New England be added so as to take in practically all the manufacturing States, the vote stands eighty to ninety-seven against the bill. If the ten voters who opposed the measure because of the income tax clause be shifted to the other side, the manufacturing States give a majority of five against protection.

"The agricultural section from Minnesota and the Dakotas to Missouri and Kansas gave a majority of two in favor of the bill. They were twenty-seven to four in favor of the McKinley bill. The Western States voted six to ten against the Wilson bill; they were solid for protection three years ago.

"Summarizing, we find eleven States, casting sixty-eight votes, solid for the Wilson bill. All of these except Colorado are in the South, while eight States, casting sixteen votes, are solid against it. Three of the latter are in New England, the others are new States of the Northwest. Leaving out the votes of the States that were solid, the bill would have passed by a majority of twelve. No sort of combination, comparison or analysis of this vote can be made to yield encouragement to the protectionists."

THE REPUBLICAN OUTLOOK.

HON. THOMAS H. CARTER, Chairman of the Republican National Committee, concludes as follows an article in the *North American Review* on "The Republican Outlook:"

"Republican loss in the past has resulted from the abatement of party enthusiasm through the elimination of sentiment, personal disappointments resulting from the friction incident to a long-continued administration, discontent and unrest born of extraordinary prosperity, a misunderstanding between Eastern and Western Republicans as to the safe and effective method to be employed for the restoration of bimetalism, the suppression by force of the Republican vote in the South, the cohesiveness and ever-increasing strength of the vicious elements in large cities, and a misunderstanding as to the real character of the McKinley law.

THE PARTY FOR ADMINISTRATION.

"The great work to be done in the future for the advancement of civilization and good government in this country insures the perpetuation of Republican supremacy. It is the only national party in the United States worthy of the name and entirely equal to the intelligent administration of the general government. In the arena of peaceful conquest its great

mission has scarcely begun. It remains for the party in the future to place our tariff system on a permanent basis along protection lines, and to develop the American merchant marine until our flag shall float over our messengers of commerce in every harbor and over all the seas.

AN AMERICAN POLICY.

"The Monroe doctrine must be rescued from the domain of sentiment and be recognized as a living, vital and inviolable principle, supported by the strong arm of the government. The two oceans must be united by the Nicaragua Canal. The perpetuity of our republican form of government must be guaranteed by insuring honest national elections. The men who saved the Republic must enjoy respectful consideration in their old age. The claim of men to superiority over the material things created by their labor must be maintained. The principle that the nation is greater than any of its component parts must not be surrendered. Our foreign policy must become a strong American foreign policy—so firmly established and vigorously maintained that all the nations of the earth will extend to us the respect and consideration due to the strength we have attained and the high order of civilization we have reached. Bimetallism must be restored on a safe and permanent basis. The great work of internal improvements must be continued.

"To these and kindred questions the Republican party will be commissioned anew to address itself at the next general election. The present unfortunate experience cannot fail to impress the country with the gravity of the mistake made in 1892, whereby the progressive work of the party was suddenly interrupted.

OUR PRESENT ILLS.

"With a manifest misinterpretation of public sentiment presented through the Wilson bill; with current history verifying to an unfortunate degree all predictions made by the most ardent protectionist with reference to the destructive evils to follow the abandonment of the protective policy; with closed factories and open soup houses; with disorganized business and organized charity; with breadless homes in the midst of the world's greatest granary; with the increase of the flocks of Australia and of South America simultaneously with the disappearance of the flocks from our own pastures; with New England idle and old England active; with assignees and receivers as prominent business factors throughout the land; with organized labor seeking, not *higher* wages, but *any* wages; with decreased exports and increased imports; with cheap things and no chance to earn a dollar to buy them; with idle miners and flooded mines; with increasing farm products thrown into decreasing markets; with our foreign policy reversed, to the humiliation of the nation; and with confidence and hope supplanted by doubt and uncertainty—who can question that the contrast of *worse* with *better* days will result in the overwhelming triumph in 1896 of the party of progress, patriotism and prosperity?"

IS NEW YORK MORE CIVILIZED THAN KANSAS?

MR. J. WILLIS GLEED takes as the text of an article in the current number of the *Forum* the following statement which appeared in a recent issue of a New York paper: "We do not want any more States until we can civilize Kansas." Mr. Gleed first enters protest against the disposition on the part of citizens of the East who are acquainted with the great West only through the headlines of newspapers to judge of Kansas, for instance, to infer that the present Governor or the Hon. Jerry Simpson voice the general political or economic belief of Kansas, or that Mrs. Lease is a type of the women of that State. Adopting John Stuart Mill's statement as to what are indications of civilization, general intelligence and culture, general morality, general health in the social relations, general good fellowship and happiness, and generally distributed wealth and power, he proceeds to draw a comparison between the people of Kansas and New York, and he finds from an examination of the tangible evidences in these two communities that Kansas does not suffer by the comparison.

EDUCATION.

In point of illiteracy he states that in 1880, the last year statistics upon this subject are to be had, the percentage in Kansas was about the same as in the State of New York, five and a fraction. "In Kansas in 1890, four-fifths of all the children under eighteen and over five years of age were enrolled in the schools; in the State of New York scarcely more than two-thirds; in New York City less than one-half. Kansas spent on her schools \$5,000,000; the State of New York, with more than four times the population, only \$17,500,000. Kansas to-day has a permanent public school fund of \$6,000,000."

"The State of New York, with a population four times as large as Kansas, has thirty colleges for men and women, with about 12,000 students, and a large percentage of these students come from other States. Kansas has eighteen colleges, with 4,200 students enrolled, practically all from within her own borders.

WHAT THEY READ.

"New Yorkers are certainly great readers of newspapers. Kansans are also, and Kansas has 759 newspapers; the State of New York has not three times the number. Practically speaking, New York reads only New York publications. The three Kansas City daily papers are supported largely by Kansas, and the best St. Louis, Chicago, New York and Boston papers have many subscribers in the State. The people of Kansas really read and discuss the speeches made in Congress.

"There are in Kansas a hundred towns and cities having from 1,000 to 40,000 inhabitants. It would be hard to find one of these without a well-patronized public reading room and library. Almost all these villages and cities have active literary clubs."

RELIGION AND MORALS.

Mr. Gleed adduces evidence to show that the moral tone of the people of Kansas is much higher than

that of the people of New York State, and that the social conditions of the Western State are upon the whole much safer, more wholesome and civilized than those of the Eastern State.

"If the religious character and habits of the people are to count in determining the degree of their civilization, then it is to be observed that Kansas has forty-one Young Men's Christian Associations; New York State, with four times the population, has only 148; Kansas has more than 1,000 Societies of Christian Endeavor; New York State only about 3,000; Kansas has about 600 Epworth Leagues, New York State only about 1,200. Kansas has 4,927 church organizations; New York State 8,237. In Kansas there are 269,000 communicants in Protestant churches; in New York 1,018,000. New York has 1,153,000 communicants in Catholic churches, and including these it has a larger percentage of church communicants than Kansas. More than half of the church members in New York State are Catholics; in Kansas less than a fifth. The church communicants in Kansas are 23 per cent. of the whole population; in New York, including Catholics, 36 per cent.; in New Mexico, practically all Catholics, 68 per cent. Excluding Catholics, Kansas has a larger percentage of church communicants than New York. It is, perhaps, fair to exclude the Catholic church for the reason that children are born into that church, they become communicants before they have really reached years of discretion, and once a churchman always a churchman.

As to Kansas society, says Mr. Gleed, it may lack ritual and regalia, but it does not lack sincerity, friendliness, wit and sense. In point of wealth, which in one sense is an indication of civilization. New York, of course, has the advantage, the real value of assessed property in that State being about \$1,000 per capita, as against \$750 in Kansas.

POLITICAL SOUNDNESS.

But it was the recent political phenomena against which the impatience of the New York *Evening Post* was especially directed. The implication in the statement from that paper which Mr. Gleed quotes, is that the people in Kansas are not fit to govern themselves or to participate in the government of the country. For this charge Mr. Gleed has also an answer. He says: "If vigorous patriotism, if prevalent honesty in the administration of public affairs, if respect for law and obedience to it—are evidences of civilization, then Kansas must be quite as civilized as New York. Taking Mr. Theodore Roosevelt's recent 'History of New York City' and skimming the table of contents from 1775 down, one strikes such hints as these: 'Lukewarmness about Revolution,' 'Mob Violence,' 'Tory Plots,' 'Doctors' Mob Riots,' 'Political Riots,' 'The Spoils System,' 'Riots,' 'Election Frauds,' 'Municipal Bribery,' 'Police Riots,' 'Secession Influences,' 'Draft Riots,' 'Hibernian Riots,' 'Political Corruption,' 'Stock Swindling,' 'The Tweed Ring,' etc. New York city was the stronghold of disloyalty in 1776; and in January,

1861, its Mayor, in a message to the Common Council, 'proclaimed disunion to be a fixed fact, and proposed that New York should herself secede and become a free city with but a nominal duty on imports.' The New York draft-riot was more horrible and barbarous than anything ever charged to the bushwhackers and guerillas of the South. The rich and the poor were plundered. Inoffensive negroes were put to death with torture. Charitable institutions were attacked. The attempt was made to burn a hospital filled with wounded soldiers. New York State and New York city were unable or unwilling to crush the mob, and regiments of troops had to be withdrawn from the front at a critical time to restore order. These troops attacked the rioters, as Mr. Roosevelt says, with a commendable desire to do them harm. They did them harm, shooting some 1,200 of them before the affair was ended."

THE POPULISTS.

Mr. Gleed makes no defense of what he chooses to call the "many absurdities" which the Populist party has from time to time mistaken for its principles, and which it has from time to time abandoned. That party, he says, has done incalculable harm to the reputation of Kansas. It was condemned by the people at the last election, and will, he predicts, be duly executed at the next. It sprung into being as the result of general financial distress, such as worked a revolution in New York, Ohio and elsewhere, at the last election.

KANSANS NOT A BAD LOT.

Mr. Gleed concludes: "The people of Kansas are homogeneous; they are of one race. They have inherited common impulses, common customs, common religion and common ideals. They are by no means a perfect people, though it may be said that this argument would seem to make them so; they are not perfect, but at the same time this country and the cause of good government and higher civilization are receiving and will receive as much good and as little bad, as much help and as little hindrance, from the State of Kansas, as from any other State in the Union."

THE CHURCH OF ENGLAND.—The population of England and Wales is 29,150,000, and the Established Church provides about 6,500,000 sittings. The number of estimated communicants is, in round figures, 1,600,000, an increase on the year of 170,000. The number of children in the Sunday schools is rather over 2,000,000. The gross total income of the parochial clergy is £4,213,000, not much more than the odd £213,000 being derived from pew rents. The beneficed clergy pay out of their own pockets £273,000 for assistant curates. Including this latter amount, the voluntary contributions for church work for all purposes amount to the splendid total of £5,401,000. These figures are for 1892 and are given in the *Sunday at Home*.

MR. GLADSTONE'S RETIREMENT.

THE retirement of Mr. Gladstone has not cast the shadow it might have been expected to cast on the complexion of this month's English reviews. Possibly its colossal significance may have impressed the editors as either all too great or too familiar to be rightly handled in a magazine. Needless to state, there have been many eloquent valedictories. A few may be cited here.

THE DESTROYING ANGEL.

Let the sour come before the sweet, and the sourness of *Blackwood's* is unrelieved by any flavor of generosity toward the aged statesman. This is its farewell: "We believe Mr. Gladstone's retirement to be a signal blessing for the country. Our only regret is that he did not take this step thirty years ago. . . . Steadily during the last quarter of a century Mr. Gladstone has been divesting himself one by one of all the attributes and qualities of a statesman, until as he leaves the scene we can recognize him only as a popular agitator, a political force, an English counterpart of the factor known in American politics as the 'Boss.' . . . Mr. Gladstone's position during the last quarter of a century has been that of the destroying angel of British politics. . . . Mr. Gladstone, like smaller men, has through life sought in various and not always ignoble ways to serve himself. He was, as he claimed to be, an 'agitator,' who traded on the aspirations of the people, worthy and unworthy alike, without true knowledge of their wants or living sympathy with their ways."

In the *National Review* Admiral Maxse exults that "the great Arch-Apostle of national surrender has gone!—and the country breathes." He finds fault with the *London Times* ascribing to the retired statesman "high aims and lofty ambitions." What were they? he asks. "He was a master of fiscal expedients, but, as far as I am aware, he did not initiate a single measure of popular benefit."

"HE THAT HATH CLEAN HANDS."

"The freest from thoughts of personal aggrandizement of all the men that ever ruled England." Such is the verdict of Mr. A. J. Wilson, editor of the *Investors' Review*, who may be regarded as a veritable *advocatus diaboli* in respect of commercial integrity. To Mr. Wilson "all too frequently, politicians of all hues seem mostly on the side of the Devil in human affairs." But, appraising Mr. Gladstone's worth as "a political and social economist," he declares that "throughout his life Mr. Gladstone has been eminently clean-handed. Not only has he never taken a pension for himself from the public purse, but he has never, when not in office, eked out his income by means unworthy of a gentleman and a man of true honesty. He preferred to write magazine articles and books about Homer. Consequently his name is never found among those who 'punt' on the Stock Exchange; no limited liability company ever got him to be a director, nor could a single financier ever conjure with his prestige because of any selfish interest

he might have in view. Mr. Gladstone's very purity of mind and conduct in this and other respects was doubtless a source of weakness to him in practical affairs, and for one thing marks him throughout his career a bad judge of men. It is visible not only in his own life, but in the way he has abstained from quartering his family upon the nation."

AN ELOQUENT PANEGYRIC.

The transfer of the Premiership is the theme of two articles in the *Contemporary* which are marked by a personal pathos and fervor rare in reviews. Dr. Robert Spence Watson waxes eloquent in his peroration on "the Nation's Loss." "Through it all our noble leader has been in the van. How his voice has rung through the country, always brave, always hopeful, always true. How at times his speeches have been as those of one inspired, and he has risen beyond himself in the earnest and passionate longing that at length justice should be done. Cruel and shameful taunts, coarse invective, brutal misstatement, cold and bitter sneers with no pity in them, the paltry horseplay of young hereditary legislators—all flew past him as things of naught. His superb courtesy, his knightly chivalry, his encyclopædic knowledge, his command of language, his play of countenance and propriety and variety of gesture, his grasp of principle, his power of exposition, his love of accuracy, his intense moral earnestness, his force of conviction in the truth and justice of his cause—how these stood out against the counterfeit panoply of his foes. How he fought and worked and wearied until he had done what he could, and the child of his old age, his Benjamin, had passed through the House of Commons to be contemptuously spurned and rejected by the House of Lords! But he had placed it in such a position that its absolute and ultimate acceptance was thenceforth but a question of time.

WHAT WE HAVE LOST.

"And yet we must lose him—the pity of it! the pity of it!—just when his phenomenal powers were unabated, when his voice rang out in its full and wondrous beauty . . . when he had at length led us face to face with the hereditary foe with whom he has borne so long, and from whom we have suffered so much. His intellect and memory unimpaired, his elasticity of body and mind such as the most gifted youth might envy; his experience, his eloquence, his earnestness, his inspiring personality, we must lose them all. Two of the chief bodily necessities of a leader, sight and hearing, these he has been in a measure deprived of, and under these deprivations he has been compelled to lay down his arms. Oh, the pity of it; the pity of it!

"England has never seen his like before; will it ever see his like again? Not in our time, at all events. We shall listen in vain for a voice like that which is gone. But we have an abiding incentive to earnest toil for others in his great example, and our children and their children's children will have a precious heritage in the memory of his noble life. His works remain with us: those which are accomplished as a

blessing, those yet to be carried out as a solemn duty. Our love and gratitude will best be shown by our resolving that his wishes shall, by our unwearying labors, become the law of the land he has served so lovingly and so long."

CONTRAST BETWEEN THE OLD PREMIER AND THE NEW.

Mr. Massingham's eulogy on "The Old Premier and the New" is perhaps more discriminating. He describes as the one fixed idea of Mr. Gladstone's career, the view that international relations ought to be based on a certain free and generous ethical dealing. But the main purpose of the article is to enforce the moral that "Mr. Gladstone's successor must, in the main, shine by force of contrast with his illustrious forerunner. Youth against age, nationalism against cosmopolitanism, the collectivist as against the individualist point of view, the development of local and industrial organizations as against the supreme attractions of life and warfare in the central Parliament, an approach to Federal Home Rule as opposed to Mr. Gladstone's more exclusive method—these are the main landmarks of the course along which the Liberal party is now being steered. The fate of the Rosebery administration may quite possibly not be a great one, though the signs of a Rosebery legend in the country are a notable testimony to the desire for intellectual novelty which sustains the new formation. But Lord Rosebery may very well succeed in settling nearly all the more urgent problems of his day—Home Rule, hereditary legislation, the complete unification of London, the Eight-Hours movement, the equipment of the London County Council with powers which would pave the way for the largest experiment in municipal collectivism known to the civilized world. . . . His main source of strength lies in the social movement which made it inevitable that when Mr. Gladstone went he would be succeeded by a municipal statesman."

ENGLAND'S NEW PREMIER.

THE article, "Lord Rosebery and the Liberal Crisis in England," by J. Castell Hopkins, in the *Forum*, is full of biographical information which supplements well the sketch of the new Premier's political career that appeared in the April number of the *REVIEW OF REVIEWS*. We quote from Mr. Hopkins' article as follows:

A DEMOCRATIC ARISTOCRAT.

"The new Prime Minister of Great Britain is undoubtedly a remarkable man. In English politics any age under fifty is comparative youthfulness, yet Lord Rosebery at forty-six succeeds as leader of the Liberal party a veteran who was fighting its battles long before his successor was born. Reared amid aristocratic surroundings; growing up in political life apart from the vigorous struggles of the House of Commons; habituated to the customs of high position, the respect still given to hereditary rank, and the exercise of that power which immense wealth gives its possessor, he takes the helm of State as the

democratic leader of a party which is pledged to wholesale measures of reform. Twice Secretary of State for Foreign Affairs in a Liberal Cabinet, he has succeeded in changing the entire tendency of his party policy; he has proclaimed the necessity of continuity in the treatment of external affairs; he has impressed himself upon the statesmen of Europe as a strong man of wide views and great determination; and he has acquired a degree of popular confidence in this direction which makes even Conservatives look upon him as a sort of national sheet-anchor which prevents the State from drifting to ruin under Liberal guidance.

"Lord Rosebery seems to have been successful in attaining almost everything that he has ever desired. Twenty years ago he was comparatively poor. In 1878 he married the daughter of Baron Meyer de Rothschild and became one of the richest men in England. The wealth that he had freely enjoyed during Lady Rosebery's lifetime became entirely his at her death in 1890. His first speech in the House of Lords in 1871 brought him many encomiums and appointments to several positions of importance. His presidency of the Social Science Congress in 1874 resulted in an address which, to the astonishment of all who knew him as a young man of only twenty-seven, was published in the *Times* next day to the extent of some six columns. His fluency, wit, sound reasoning, pleasant delivery and attractive style early brought him a reputation as a speaker which has been steadily growing. His visits to Australia and to Canada, coupled with a consistent advocacy of closer Imperial relations and continuous expressions of affection and praise for the colonies, have made him popular in every part of the external Empire.

POPULAR WITH THE MASSES.

"The new Premier is a widely popular man. Like Mr. Gladstone he is popular with the masses. Like Lord Salisbury he is admired by the classes. The most democratic section of the United Kingdom is Scotland, and it is there that Lord Rosebery commands the largest comparative following. The most democratic public body in England is the London County Council, and there he commands the closest attention and the sincerest regard and respect. He frequently expresses his belief in democracy and his adherence to its principles, but never in an aggressive or violent form.

"He has taken practical steps in the road of reform. The equipment of the People's Palace in London, the removal of religious disabilities, the improvement of dwellings by the 'Artisans' Dwelling act,' the efficient work done by the London County Council, under his direction, in bettering the conditions which surround the every day workingman in the crowded streets of the capital, are sign posts along the path he has taken.

HIS POSITION ON HOME RULE.

"Lord Rosebery is a supporter of Home Rule. There can be no doubt of that fact. But the tenor of his speeches—and they are not very numerous upon

the subject—proves him to be a calm, reasoning advocate of the idea, willing to give and take in all details, but desirous in a general way of insuring the success of local self-government as a principle applicable to Ireland. Still he is not an enthusiast upon the subject. The policy he considers a leap toward the light: the principle of governing through the properly ascertained wishes of the Irish people as much settled as is Magna Charta; the result, assured prosperity."

PARTIES IN THE BRITISH PARLIAMENT.

EVERY one knows that the two great political parties in England are the Liberal and the Tory. There are, however, several smaller organizations of which we in this country hear very little, and it is of these that the Hon. Justin McCarthy, M.P., writes especially in the *North American Review*.

Besides the Liberals and Tories, there are to-day an Irish party, a Scotch party, a Welsh party, a Labor party, a Woman's Suffrage party, a Temperance party, a Colonial party, and other parties more or less conspicuous. They are all solid and self-centered bands, whose partisan allegiance is not always to be counted on with certainty by either of the two parties in England. The purpose of the Irish party is well known. The Scottish party is not yet so compact and so resolute in its organization. Its ultimate object is Home Rule for Scotland. The immediate object of the Welsh party is the disestablishment of the State church in Wales, and later on it may be expected to demand Home Rule for Wales. Both the Scotch and Welsh parties have been inspired directly by the success of the Irish National movement.

THE TEMPERANCE PARTY.

The Temperance party, or party in favor of prohibitory legislation as regards the sale of intoxicating liquors, has grown to immense power in the state. Thus far the party have habitually acted with the Liberals, because they believe there is better hope for their cause from the Liberals than from the Tories, but they would at any moment forsake the Liberals and stand by the Tories, if the Tories were to promise them a full measure of local option and the Liberals were to refuse it. Regarding the Woman's Suffrage movement, Mr. McCarthy says that while it has been going on for several years, it has not lately made any conspicuous advance in the House of Commons. This is partly due to the fact that the organizers of the movement have been very patient and have not been willing to thrust themselves in the forefront of parliamentary agitation.

THE LABOR PARTY.

Representation of labor in Parliament dates from the year 1874, when Mr. McDonald, a man long since dead, and Mr. Burt, who still is in the House and is now a member of the Liberal Administration, were elected to Parliament. Regarding Mr. Burt, the writer says, "no man in the House is more respected there." Mr. Burt, although he began active life as a workingman in the mines, has managed somehow to educate him-

self, and is now better educated, taking him all around, than many a man who has gone through a full course of university training.

JOHN BURNS.

The most conspicuous man among the newer members of the Labor party is Mr. John Burns. Mr. McCarthy gives a very sympathetic sketch of the life and work of this distinguished labor leader. "He has about him the charm of a strong, self-reliant manhood—he is above all things a man. You can see this in his dark, soft, gleaming eyes. They are eyes which invite confidence. John Burns is a working engineer who has led a toiler's life, afloat and ashore and under various conditions. He has worked along those mysterious African rivers which are associated in the minds of most of us with the explorings of Stanley and of Emin Pasha. He has worked in London sheds and yards. He is a fine and a powerful speaker, and can control a vast meeting of workingmen with irresistible force. He is a great democratic influence, and political parties and social organizations can hardly reckon without him. He seldom speaks in the House of Commons, but when he does speak he speaks well and goes straight to the point. He never speaks but on some subject which he thoroughly understands and about which he has something important and direct to say. He has a fine and even thrilling voice, and one always feels that some day when his time comes and his own question is uppermost he will make a great speech. For the present that time has not come, and John Burns has given loyal and devoted support to the Home Rule bill. The natural defect of many such men in the House of Commons would be to think of nothing but their own cause. One who has been long engaged out of doors in a particular cause is apt, if he gets into the House of Commons, to lose all sense of perspective and proportion. He does not see that something else has to come first. He will not see that anything else ought to come first. So he persists in merely trying to beat his own drum and to prevent others from rattling their drums at all. He becomes like a player of cards who insists on playing out of his turn. Thus he puts people against him and even perhaps against his cause. He sinks very often into a mere 'crank.' I have known honest and gifted and devoted men become utter failures in the House of Commons—failures for themselves and for their cause—through this fatal misconception. John Burns has none of this weakness. I do not believe he would surrender a single principle of his cause for all the governments and all the political parties in the world. But neither would he injure another great cause or show himself impatient with it or unconcerned about it because it happened to be in before him. When John Burns came into Parliament at the last general elections, he found Home Rule in possession of the field. Nothing on earth could have displaced it. Even that great disorganizer of English domestic reforms—a foreign war—a war between England and some foreign State—could not have pushed Home Rule from its place.

Therefore, John Burns, being a sturdy Home Ruler already, threw his energies and his heart into the task of advancing Home Rule. He worked for it with unceasing courage and good sense, both in public and in private. He never missed a chance of speaking for his own cause; but he recognized the fact that the Home Rule cause 'had the floor,' and he made no effort to impede it, but, on the contrary, helped it cheerfully in every way that came within his power."

THE COLONIAL PARTY.

The Colonial party is the newest of all the parties in the House of Commons. It is composed of members of Parliament who were born, brought up in some of the colonies, or have lived much of their lives there, or have pecuniary or other interests in the colonies, or have traveled there and made colonial questions a study on the spot. The chairman of the party is Sir John Gorst, who lived a long time in New Zealand and has the peculiar distinction of being the only member of Parliament who can speak the Maori tongue. The object of the party is naturally to see that the interests of the colonists are properly presented to Parliament, and to consider how to deal with the growth of the principle of federation, a principle which is becoming a burning question throughout England's great colonial possessions.

THE PARLIAMENTARY WHALE.

"AS the mouth of the whale will admit a porpoise, but the gullet will hardly pass down a herring, so is the capacity of Parliament to turn out completed legislation. It will entertain, but digest very little." With this lively simile, Mr. T. M. Healy, M.P., opens a rather discursive article in the *New Ireland Review* on procedure in Parliament. The cry of a constituent for a "short bill" to end some particular grievance shows how little known the slowness of that procedure is. The new member chafes under the rules of the House, but these, says Mr. Healy, may not be altered; "First, because the rules are good rules and useful rules, unless abused by party malice," and next, any attempt to alter them would require a whole session to itself. "The change between the Parliament of to-day and ten or twelve years ago is very great. For every two men who wanted to talk before the suffrage was extended there are five now."

NO APPRENTICESHIP FOR LEGISLATORS.

Mr. Healy complains that there is no department or official from whom the new member can get guidance as to putting his private bill into proper shape, and into due relation to existing legislation. "Of the six hundred and seventy men in Parliament probably not more than fifty could frame a question which would pass the clerks at the table without correction, not to speak of drawing a bill." After describing the sparse chances of a private member's bill in Parliament, he despairingly concludes: "Except for the purpose of ripening questions by debate, and thereby compelling the executive to take action, the great annual parade

of private bills by members at the opening of every session is in sad contrast to the actual legislative harvest in the autumn when the session ends."

WHAT DO THE RUCK OF SILENT MEN GAIN?

In passing the Home Rule bill, and in proving Ireland incapable of government from London, Irish members have something to show for their labors. "What English members in the mass have to show for their energies in the same space of time it would not be similarly easy to appraise. Some of them, of course, get social distinction and cheap titles, others enjoy the excitement in the House and the freshest news in the lobbies, but what the ruck of silent men gain by wasting their lives at Westminster is a puzzle. Lots of them perhaps ask themselves *cui bono* as they pace the lobbies without even an occasional nod of recognition from the leaders they silently and loyally serve. The slow rate of advance, compared with the enormous physical strain thrown upon hundreds of men, is sadly disproportionate."

ADVANTAGE OF A LARGE LEGISLATURE.

The number of Members (670) forming the House of Commons is "almost gigantic." "The United States of America, with nearly twice the population, has hardly half as many Congressmen. The American Senate numbers 88, and even when all the Territories become States, can never exceed 100, while the House of Lords has 570 Peers." But numbers have their advantage. "Commonplace persons generally hold steadily by a leader, and this gives continuity to policy on both sides and sustainment to the foremost men. Were the English Parliament smaller, wire-pulling would be more powerful, and the influence which personal canvass or lobbying exercises on minute bodies would be more felt."

PROS AND CONS OF PAID MEMBERS.

Yet the size of Parliament is the chief obstacle to payment of members. "An annual provision of \$1,000,000 would be necessary to provide \$1,500 a year for every one not already in receipt of official salary." Another obstacle is the objection of "the richer section of the Liberals" to breed rivals now too poor to compete for their seats. "Payment of members would not be an unmixed benefit anywhere; but recent events in Ireland have shown the danger at a crisis of permitting representatives to regard themselves as the personal following of one man, who is endowed with a fund to control their remuneration."

Yet payment of members would restore a right of initiative to the constituencies.

Science-Gossip, established in 1865 as *Hardwick's Science-Gossip*, begins a new series this month, and is under the editorship of Mr. John T. Carrington and Mr. Edward Step. Mr. Carrington was for thirteen years editor of the *Entomologist*, and for many years was connected with the Natural History department of the *Field*.

ECONOMISTS ON THE ENGLISH COAL WAR.

THE stand made in England last year by the miners for a "living wage" has won from experts in economics a consideration so favorable as to be likely to bewilder employers of the old school who seemed to think they could always reckon on the thoroughgoing support of English political economy. Two articles on this topic appear in the current number of the *Economic Journal*. Mr. J. E. Munro presents "some economic aspects of the coal dispute, 1893." "Colliery owners," he says, "allege that prices are governed by demand and supply, and that prices ought to govern wages; the miners allege that the colliery owners can control prices, and that in any case wages ought to govern prices." Mr. Munro argues: 1. That "the price of coal will tend to vary and a fall in price can only be avoided by a restriction of supply, such restriction at a certain point involving short time, if a minimum wage is to be maintained." He points out that the exaction of royalties serves to equalize the conditions of competition between lessees. "The nearer the actual royalty approaches the royalty the mine can afford to pay the less the probability of any disturbance in prices and wages arising out of one colliery owner underselling another." 2. "While the relation of wages to prices is close and intimate, we cannot go so far as to lay down the principle that price ought to govern wages, or the opposite principle that wages ought to govern prices." "The miners are entitled to a careful examination of their position." 3. On the argument that if the minimum rate be higher than that paid in other industries, workers will be attracted from other industries and so force down the minimum, Mr. Munro observes that the minimum is now fixed, not by number of laborers applying for work, but by the federated masters and federated men, and that one or two years are needed to qualify a man for coal mining. No evidence has appeared to show miners' wages affected by migration of labor.

ECONOMIC FORCES AT WORK.

The economic forces which may possibly break down the minimum, and which Mr. Emerson Bainbridge recently detailed are next examined. 1. The competition of different coal districts. There are "decided limits" to the amount of trade which Wales and the North could take from the Midlands. Increased output in non-Federation districts would require fresh miners; these would come from Federation districts, and economic adjustment would follow. 2. The possible decrease in domestic, industrial or foreign demand. "It is very doubtful if a moderate rise in the price of coal would cause any substantial decrease in household consumption." So long as industries affected by the price of coal can be maintained at a profit, the rise in coal does not diminish the total income of the country or its purchasing power. "If it decreases the purchasing power of the consumer or of the capitalist, it increases in a corresponding degree the purchasing power of the miners. A new distribution of the annual income is the result."

The bugbear of competition between England and other countries finds small mercy at Mr. Munro's hands. "A considerable rise in price might take place in England without our foreign trade in coal being affected by the coal-producing countries of Continental Europe."

"Notwithstanding the alleged longer hours and lower wages, the cost of production as measured by the price of coal is much higher on the Continent."

	Price per ton at the pit's mouth.			Output per worker in 1889
	1888. s. d.	1889. s. d.	1890. s. d.	
Northumberland.....	4 4	5 4	7 7½	From 300
Durham.....	4 5	5 2	7 3½	to
S. Yorkshire.....	5 0	5 0	8 9	400 tons
Westphalia.....	6 0	8 6	11 6	500 "
Belgium.....	6 8	7 6	—	180 "
France (Nord et Pas-de-Calais).....	7 6	7 8	9 5	200 "

"The reason of this is that . . . on the Continent . . . the seams are thin, and have often to be worked at great depth."

"Apart from lowness of price, we have special advantages as regards the quality of the coal and facilities of shipment."

"Notwithstanding the very varied fluctuations that have occurred in the coal industry in England, it has always preserved its export trade, and actually increased its coal exports to those countries whence competition is dreaded."

Mr. Munro does not refer to possible competition from America, held to be England's most formidable rival in the coal trade.

LONG HOURS AND LOW WAGES NOT DECISIVE.

For the argument that "any increase in the cost of production in England will tend to drive English industries abroad," Mr. Munro has scant respect. "Which industries?" he asks. Certainly not English railways, canals, docks, gas and electric light works, and house building. "Many of the most important industries of England must from necessity be carried on within the country." Of other industries, possibly the pig iron trade is most sensitive to foreign attack. But compare Germany and England: "Both these countries have to import the hematite from Spain; both possess a plentiful supply of coal; the hours of labor are longer and the wages of labor are less in Germany than in England. It might, therefore, be expected that Germany could produce pig iron from hematite much cheaper than England. The contrary, however, is the case. The cost of production is 10s. per ton higher in Germany than in England."

"A FULL WEEK'S WORK AND A FULL WEEK'S WAGE."

Mr. F. D. Longe, "the first of Mr. Mills's contemporaries successfully to attack the theory of the Wages Fund," declares the only result of the coal strike is to show that the abstinence of 200,000 miners from producing coal for three months can so reduce supply as to create a demand sufficient to keep their wages at the old level for a short time, until normal conditions again operate. "The principle of a standard rate is not new to the coal trade." Employers in any trade not

moribund "have a common interest with their laborers in preventing wages being reduced to such an extent as would not only fail to give their workmen sufficient livelihood, but would tend to diminish the supply of labor on which they would depend for the continuance of their trade."

Mr. Longe will not discuss the figure at which the disputants strove to fix the standard rate. The number of hours actually worked is a question not less important. The short time worked of late is due to the employer's practice of keeping on more men than he can usually fully employ. "The employers must be held mainly responsible for this condition of things." Mr. Longe observes in conclusion: "If the miner was only allowed to go down the pit under a contract which would secure a full week's work to the employer and a full week's wage to the workman, the wages problem in the coal trade would be much simplified. If on the other hand the trade is to be carried on under a system which keeps a larger number of men depending on employment in each colliery than be fully or regularly employed, the fixing of a standard rate will do little toward improving his condition."

ON THE BRINK OF REVOLUTION.

England as Professor Goldwin Smith Sees Her.

THE first article in the *Nineteenth Century* makes delightful reading. To hear a clever shrew scold is a rich treat, provided the listener is not the butt of her invectives; it is such a fine study in language and temper. But it is poor sport beside the spectacle of a clever literary man who goes on shrilly vituperating without check or pause or dropping his voice for more than a dozen pages. Mr. Smith has revisited political England, and great is the day of visitation. To say that he pours out his vials of wrath upon that unfortunate country is much below the mark.

"SOCIALISM, COMMUNISM, ANARCHISM."

It was only to be expected that he would wail over the Commons passing Home Rule; an event "the moral effect of which is too likely never to be annulled." But "Home Rule is now the least part of the matter."

"The appeals made to the hatred of the masses for the classes have been heard. The spirits called from the deep of social passion have come at the call. By violence of one party and the weakness of the other, the nation is being visibly drawn toward the brink of social as well as political revolution. The sanctity of contract, jealously guarded against legislative violence by the American Constitution, has been not only disregarded but trampled on in agrarian legislation for Ireland, and the principle will be shaken through the whole of a great commercial nation. Confiscation, as might have been expected, has crossed from Ireland to Great Britain. . . . Socialism, Communism, Anarchism are rife throughout Europe."

DEMOCRACY WITHOUT SAFEGUARDS.

The United States in deciding on Democracy fenced round the system with many safeguards, to which England has no counterpart. By the prodigious growth of manufactures in England "the balance of national character has been deranged." "Never was there such an audience for those who live by preaching industrial war." "And these masses are getting powers of government into their hands." "Overpopulation is another danger;" which is aggravated by the monopoly of the Unions. Disorder in New York has the community against it, in London it has only the police. British industry has a largely artificial basis, and from a great shock "untold ruin might ensue."

"To proclaim Democracy is to renounce Empire. . . . Not Russian ambition or native insurrection is the great danger of British empire in India, but British democracy, which already is joining hands with Hindu agitators. The spirited diplomacy of the British Foreign Office and the policy of great armaments seem to be a survival. . . . The constituency which supported them has ceased to exist"—Sir William Harcourt's big naval Budget notwithstanding.

"THE LAST INGREDIENT IN THE CAULDRON."

At bottom of the social disturbance is "the dissolution of fundamental beliefs. The governing classes seem to devote themselves to pleasure and excitement," instead of to the stern political duties of the hour. The landed gentry have broken down under agricultural depression.

Then comes, of course, as "the last ingredient in the seething cauldron of change" the revolt of woman, emancipation of wives, insurrection of daughters.

What governing power has England to save her and her empire from revolution? Certainly not the power of the Crown. "The House of Commons arrogates omnipotence, but has become the slave of the caucus and its demagogue despot." The House of Lords "now stands between the nation and dismemberment," but on its present footing cannot permanently regain power or afford lasting securities against revolution. For all these perils "faction, politely styled party," is responsible.

THE DUTY OF THE HOUR.

Is there no way of escape? "A House of Commons manifestly demoralized, unable to dispatch the business, docked of freedom of debate by the clôture, in bondage at once to the caucus and to Irish disaffection, is proclaimed the sole organ of the national will, the supreme and only power of the State. The Second Chamber is to be suppressed or silenced. This forms the present issue. The first care of anti-revolutionary statesmanship in future will be to reorganize the House of Lords on a rational basis and make it a real safeguard, like the Senate of the United States. To defend the existence of a Second Chamber against domineering and usurping violence is the duty of the present hour."

Mr. Smith is very angry with Lord Salisbury for not having reorganized the peers during his last term of office.

TRICOUPIS, THE GREEK PRIME MINISTER.

THE *Atlantic Monthly* for March contains a thorough and valuable character sketch of Tricoupis, the Greek Prime Minister, by Prof. J. W. Jenks, who has lately returned from a journey that gave him opportunities for a conscientious study of certain phases and personalities in European politics.

Tricoupis, Professor Jenks describes as a man who disdains the arts of the demagogue and the flattery of the populace, often erring on the side of severity. He is a polyglot, very versatile, and possesses enormous powers of work. He is a man who, in the opinion of more than one member of European cabinets, is a great statesman in a small country, but a man who would have been a great statesman in any country. He comes of a family of scholars and statesmen.

A TREMENDOUS WORKER.

"In physique, as his portrait would show, he is very robust and strong, carrying his sixty-two years with the vigor of a man twenty years younger. His powers of work and endurance are simply phenomenal, though one may perhaps question at times the judgment of the man who so abuses a good constitution. When he is in office, with the burden upon him not merely of the treasury, but of all the multifarious duties in the way of local government, office-distributing, and general dictatorship that fall to the lot of the Prime Minister of Greece, he often works from eighteen to twenty hours a day, and, so far as one can learn, makes no provision at all for regular recreation or rest. At his house, one day, his sister told me that he had gone to bed that morning at three o'clock, and at seven was again in his office at the treasury department. People who wish to see him on business have, at times, appointments made late in the night, when he is more likely to have leisure than when, in the daytime, his anteroom is thronged with visitors. A Greek Prime Minister needs unlimited powers of endurance, for his work is almost that of a dictator, with corresponding duties, while his political opponents are ever watchful to catch him napping, and often do not hesitate to go to extremes to upset him."

SIXTEEN HOURS AT A STRETCH.

"Three or four years ago, the opposition filibustered and talked on the budget from four o'clock in the afternoon until ten the next morning. Divided into relays, they talked against time, raising technical points, and using all the arts common to such tactics. Members read, yawned, slept, went to the lobbies and elsewhere in small squads for refreshment, keeping well within call of the party whips; but for sixteen hours Tricoupis never left the Chamber, sitting quiet, watchful, apparently unwearied and needing no refreshment. At another session he

remained fourteen hours, and was led finally to rest a moment only by the ruse of a friend."

AN ENEMY OF THE SPOILS SYSTEM.

Greece is not second even to the United States as a country of office seekers and office givers, and Tricoupis has steadily opposed corruption and has maintained a rigid independence and scorn of petty trickery. Prof. Jenks criticises him as too careless of popular opinion, which, though he "may fairly be said to have created popular government in Greece, he wants to drive, and not to lead.

"Throughout his long political career Tricoupis has remained a poor man, caring only for his work, and living on the meagre salary paid him and the slenderest income from some little inherited property. He lives very modestly, in a rented house, with his sister, who, unmarried also, seems with him to give her life to politics and the state. No sketch of him would be complete without mention of this highly gifted lady, who has been for years his most useful aid. Day after day, and all day long, she receives friends, strangers, constituents, opponents, greeting all with the unfailing tact and courtesy that delight and win, and speaking to each his own language with an accuracy that astonishes one. 'Her drawing-room,' well says a writer in the *St. James Gazette*, 'is perhaps the nearest approach to the political and literary salon of the last century.'"

THE KING OF SIAM.

IN the *Leisure Hour* for April there is an entertaining paper on Bangkok, the capital of Siam, by an Englishman, who does not give a very pleasant account of this Venice of the East. It is illustrated with a picture of the King of Siam.

In speaking of this monarch, the writer, Mr. P. C. Standing, says: "When the present ruler of Siam succeeded to the throne, he set himself to schemes of reform, so far as in him lay: he strove to encourage the arts and sciences, as his sire had done, and followed out Western ideas as far as possible. He enjoyed nothing better than to get hold of an intelligent European and ply him with questions leading up to the subject of the improved government of Siam. In the beautiful 'King's Garden' at Bangkok I have seen a sun dial, astronomical instruments, etc., sent from Europe by order of His Majesty, and used by him with great regularity as well as with an intelligent interest. Bishop Pallegoix taught him Latin. By a royal edict, King Chulalongkorn has decreed the release of all slaves whose bondage commenced at a later date than his accession (1868). But this still leaves numerous captives. The city is the queerest conceivable admixture of the Oriental and the European. An electric light company was started, but it speedily went into liquidation. Not so the Tramways Company, which, not content with paying an extremely promising dividend, has actually opened an electric section with the best results: so that one is confronted with the strange spectacle of an electric tramcar flying along the street in juxtaposition to

the gharry, the 'riksha, and even the bullock-cart of barbarism."

THE AMEER OF AFGHANISTAN.

JOHN A. GRAY, the late surgeon to His Highness the Ameer of Afghanistan, writes a brief but interesting paper in the *Asiatic Quarterly* for April. He says that the Ameer is absolute autocrat. There is no press, and the Ameer has strictly curtailed the influence of the priests. The chief priest has hardly more influence than an ordinary civil magistrate: "Amir Abdurrahman has a high degree of education and considerable stores of information—scientific, artistic and general—acquired from books, from conversation and from observation during his travels. To the simple manners and free hospitality of Dost Muhammad he adds a dignity and a kindly courtesy of manner most remarkable in a man of his strong passions and in one who is constantly surrounded with adulation and flattery. He is readily accessible to his people; and even when suffering from the pangs of gout, he will listen patiently to the petitions of the poorest of his subjects, and give rapid though just judgment in the cases brought before him."

HIS REFORMS.

Dr. Gray speaks very emphatically of the improvements which have been wrought in Afghanistan under his rule. Highway robbery and murder are no longer common in the country, nor is murder or theft in the towns. Englishmen travel constantly between Kabul and the Indian frontier without the slightest attempt being made to injure or annoy them. Dr. Gray says that he went among the villagers freely, unescorted and unguarded. In 1890, when he sent to Kabul from Turkistan for two extra dispensers, they rode the whole distance in safety.

They had but one pistol between them, and that was unloaded. This extraordinary freedom from crime has not been attained by rose water, but Dr. Gray thinks that the execution and dispersion of the lawless tribes was indispensable. The Ameer, like Lord Rosebery, thinks that the State should concern itself with the condition of the people, although even Lord Rosebery would shrink from following the Ameer in advancing money without interest to those who are desirous of starting business on their own account. Dr. Gray says: "Should a Kabuli wish to start business for himself, and not have sufficient money, he has but to apply to the Ameer, who will, for a certain number of years, lend him a sufficient sum for his purpose, and this without interest. The Ameer has established workshops in Kabul which are really national training schools. They produce war material which he could buy much cheaper either in Russia or in India, but he insists on manufacturing them himself in order to teach his subjects the crafts of the artisan. Everything European is now fashionable in Kabul, including garments made by European tailors. The Ameer imported an English tailor to his capital for the purpose of teaching the natives

how to make clothes fit in English style. Classes were held, demonstrations given, with the result that the Kabuli tailor now makes clothes that fit. Dr. Gray at the Ameer's request started an art class in Kabul, and had five of the chief artists in the country as his first pupils.

Dr. Gray concludes his paper as follows: "One must remember that this educational system of civilizing is being carried on among a race of men who have been known hitherto simply as fighters, robbers, semi-savages, and who, unlike so many of the races of India, have shown but little if any sign that they were capable of being converted into useful producers. When I say finally that the Amir offers prizes, and of considerable value, for the best or most original work, produced either in the shops or elsewhere, it will be easily understood how much he has at heart the desire to advance his people in knowledge and civilization."

A MOUNTAINEERING QUEEN.

ALP-CLIMBING women, it is too generally supposed, belong to the English-speaking race and to the robust middle class. Mrs. E. T. Cook vividly describes to us in the *English Illustrated* the adventures of an *Alpiniste* who is neither *bourgeoise* nor English, nor any other than her Majesty the Queen of Italy. According to Mrs. Cook, who has met her in the heights:

"The Alps have no more devoted lover in any land than her Majesty Queen Margherita. . . . King Humbert has inherited his father's love of Alpine sport; and when he betakes himself to his shooting-box at Aymaville, in the Val d'Aosta, or to the hunting country of Cogne or Charvensod, the Queen retires to the neighboring Val de Lys, and revels on her part in mountain excursions. Here she can be free as air, and escape from the cares of state and of pageantry. The peasants idolize her.

"During her fifty days' stay at Gressoney Queen Margherita often dons the costume of the valley. . . . The costume consists of a bright red cloth skirt, made very full and reaching to the ankles, and a bodice of the same over a white linen chemisette with full sleeves. . . . The dress and the color are alike in rich and poor, from the baron's daughter to the peasant, but it is the embroidery and the pins that tell the tale.

"We often met her walking . . . the Queen in the pretty costume of the valley before referred to—the two ladies in sober black. Two gendarmes often followed the Queen at a respectful distance; indeed, they must have had plenty to do to keep up with her, for she walks with a good swinging English stride, not at all like most of her countrywomen."

Last August, the Queen officially as *prima Alpinista d'Italia*, "opened" a hut built for science and refreshment on the summit of Signal-Kuppa, by spending the night there. Twice during last year the Queen set out on ice expeditions. On the first expedition for three nights her Majesty camped out in the snow and ice.

THE EMPRESS EUGÉNIE AND THE CZAR.

IN the *Revue de Paris* of March 15 are a number of letters written from the Palaces of Compiègne and Fontainebleau by Octave Feuillet, the French novelist. In them the writer gives many interesting details of the Imperial Court. M. Feuillet unconsciously gives a delightful picture of Napoleon the Third's family life. The Empress more than once complained to her visitor of the troubles and griefs inseparable from royalty. She described to him vividly an afternoon spent with the then Czar, the Emperor Nicholas. The Imperial party arrived at Fontainebleau, only to be told privately that the Prefect of Police had reason to believe that an attempt would be made on the Czar's life. Nothing could be done but wait quietly, and the Emperor and Empress determined not to frighten their guest. Both in the station and on the way to the château they arranged that he should be completely surrounded and, so to speak, covered by themselves and a few trustworthy friends; and the Empress spent the whole afternoon showing the Czar over the palace and talking nonsense in order to make the time pass quickly and render a drive in the forest impossible. When relating this painful experience, she added that nothing could compensate for these kind of hours. A more sympathetic and delightful picture of the beautiful Empress of the French in her home life has perhaps never been penned, and as it is contained in a number of letters written by Octave Feuillet to his own wife, no fear of the future publication restrained the writer's pen.

DEAN STANLEY AND RENAN.

AMONG certain interesting reminiscences of Dean Stanley contributed to the *Young Man* by Rev. H. R. Haweis, he tells the following amusing incident: "I remember a dinner given to M. Renan, on which occasion I sat next but one to him, and the Dean of Westminster sat opposite. The great writers soon engaged in a warm interchange of anecdote and repartee, and the whole table listened with the utmost delight to the two most illustrious persons present, exhibiting the rare phenomenon of great wits, both at their ease and at their best in each other's society; but the piquancy lay in the fact that Renan could not speak or understand English, and the Dean had to converse in French. It was the most fearfully and wonderfully made French I ever listened to, a shocking accent, *vow savay cur jammy*, and so on; but the impetuous Dean was inconceivably voluble and ready, and, above all, the unscrupulous literal translation of English idioms into French, was courageous beyond praise; but somehow Renan understood it. The Dean's was the triumph of mind, not only over matter, but over grammar, idiom, everything; but the result was a sustained and extremely animated conversation, into which Renan cut in his own inimitable manner with the neatest epigram and the most courteous pleasantry."

THE BETRAYAL OF THE NIHILISTS.

THE Vicomte de Vogüé writes in the *Revue des Deux Mondes* on the Russian Terrorists. This writer, who is connected by marriage with General Annenkoff, was present at the trials which resulted from the avowals of Goldenberg, the Nihilist. But for this man having made up his mind to betray secrets of the Nihilist party, the efforts of the Russian administration to unravel the plot might have remained fruitless. He was arrested at Elizabethgrad in November, 1879, while carrying a valise full of dynamite, and was finally declared to have committed suicide in his cell. Those whom he betrayed, and many others, believed that he was secretly imprisoned in Siberia or allowed to escape to America. Be that as it may, this man made a complete confession, including the details of the assassination of Prince Krapotkine, his participation in the attacks on the life of the Emperor of Russia on April 2 and November 19; and he also betrayed the organization of the party of which he had been one of the leading chiefs; he named all his accomplices and defined the responsibility of each. His ostensible motive was the stopping of further useless bloodshed.

The descriptions of the court in which the small band of criminals, pale and "green" from confinement in the prison cells under the River Neva, sat facing the Russian officials, who are described not as being specially cruel, but rather as being anxious and bewildered judges, are vividly thrown in. When the court finally withdrew to consider their verdict the deliberations lasted thirteen hours. One hour after midnight the judges returned and delivered their verdict, condemning the five principals to death, while the others had to undergo sentences of hard labor for varying periods; and the three women concerned in the matter to Siberian exile. The latter gave smiling farewells to their comrades, who listened, no muscle of their pale faces moving, in dead silence to the verdict. "We left the tribunal," says M. de Vogüé, "with clearer notions of what the Terrorist party really meant. . . . The Empire had been terrorized during the year by a band of twenty-five to thirty resolute criminals—a few men of relative ability desperately conspiring, and sacrificing themselves in the midst of a small group of ignorant fanatics." The avowals of Goldenberg made it easy to reconstitute the party. Some had perished in previous executions, sixteen were now tried and condemned, but enough of them remained at large to plot and carry out the frightful assassination of Alexander the Second in March, 1881. Of the trial of the regicide, M. de Vogüé gives some curious details. A woman, the Perovskaia, seems to have been the soul of the strange and complicated murder plot. The Nihilists of fifteen years ago did not succeed in shaking the solidity of the Russian State. M. de Vogüé evidently believes that the Anarchists of to-day are similarly few in number, and that they may be tracked from one center to another and disposed of without shaking the state of France.

M. HENRI ROCHEFORT.

IN the *Idler* for April Miss Belloc has an interesting illustrated interview with Henri Rochefort, who seems to have gossiped pleasantly with her concerning his adventurous career. It appears that the distinguished French journalist, although he has spent three years in England, has made no effort to learn the English language. He has not done so because he fears that the acquisition of that language might injure his style as a French pamphleteer. Thinking French, talking French and reading French, although his body is domiciled near Regent's Park, his mind is in Paris; and he boasts that he can keep his finger on the pulse of political France better here than if he were on his beloved boulevards.

From his youth up Rochefort seems to have been of a recalcitrant disposition. "I was twelve years old when I entered the College Saint Louis, and whilst there, instead of studying, I used to spend all my time in composing verses and reading novels. It was principally through the former habit that my political opinions first got me into trouble," he continued, smiling grimly. "Imagine the horror of everybody (for this was shortly after the insurrection of 1848) when I was heard declaiming, not the compliments which were expected, but a violent Republican tirade, congratulating the Archbishop on his humanity in having adopted the unfortunate children of a political murderer!"

This spirit of contrariety has kept him in hot water all his life, and his duels are so numerous that he does not even remember the number he has fought. "'Four or five stand out in my memory,' he replied meditatively. 'My first, which was with a Spanish officer, after I had written an article which he considered insulting to his sovereign; another with Prince Murat, in which I was wounded; one with Paul de Cassagnac, where the same fate befell me; and one, since the war, in Switzerland, with an individual who sent me a challenge on account of something I had written, though to this day I do not know what was his excuse, for I do not believe that I had given him cause for offense.'"

After gossiping pleasantly concerning his experience under the Empire in New Caledonia, M. Rochefort spoke of his present position. He seems to be happier in London surrounded with pictures, of which he is a great connoisseur, and constantly employed in journalizing from a distance than he has been for some time past. He says: "I am never so happy as when I am writing. My methods of work? Well, I always use a stylographic pen, a most excellent little weapon, brought me from America by my son. As to my articles, I only make up my mind a few moments before sitting down to write what the subject is to be. You see I am in a peculiar position. People often bring me, political documents of the greatest importance, and I make use of them as occasions arise. For instance, I possess a list of all the Deputies and Senators who accepted bribes over the Panama business."

MR. SELOUS ON THE MATABELE WAR.

"THE cause and effects of the Matabele War," as recounted and estimated by Mr. Selous at the Royal Colonial Institute, appear both in the *Journal* of that body and in the *National Review*. They form perhaps the straightest vindication of the Colonists that has yet transpired. He replies directly to the charges of Mr. Labouchere, with whom he is naturally highly incensed. He narrates the atrocious deeds of the Matabele horde since they left Zululand in order to show that "they are not a gentle Arcadian race of idyllic savages, but a fierce, overbearing, cruel, and bloodthirsty people who were as certain, sooner or later, to come into conflict with the advancing wave of European civilization in South Africa as gunpowder is to explode when brought in contact with fire.

LOBENGULA'S HOSTILE PURPOSE.

He gives this account of Lobengula's purpose in his raids on the Mashunas: "His policy was to abstain entirely from actual aggression against the whites themselves, but to strike at them through the natives, on whose work the development of the country depended, thus making it impossible for white men to live in Mashunaland. By carrying out this policy more and more boldly, I think Lobengula thought he would get rid of his white neighbors, who would soon be driven to abandon the country in disgust."

"RIGHT OR WRONG, IT IS BRITISH."

But this policy the Colonists had no intention of encouraging: "Savages do not understand leniency; they take it for fear, and at once take advantage of it. Therefore, in a new country where there is a very small white population amongst a large number of aboriginal blacks, the absolute supremacy of the whites and the authority of the white man's government must be firmly established, and until this authority is fully recognized the savages cannot be treated with abstract justice. It may be wrong to occupy the waste places of the earth, to extend the British Empire and to come in contact with savage races at all. On that point I will not offer an opinion; but, right or wrong, it is a British characteristic to take possession of any country we think is worth having, and this piratical or Viking instinct is, I suppose, an hereditary virtue that has come down to us in the blood of our northern ancestors. All other nations would like to do the same, and do so when they can; but we have been more enterprising than they, and, so far, have had the lion's share. Luckily, too, as in the last century we had our Clives and Warren Hastings, so at the present day we have our Rhodes and Jamesons and Lendys, and so the work of annexing and administering new countries goes on."

THE RAID AT VICTORIA.

Mr. Selous quotes from Dr. Jameson's letter to the Matabele king, in May to prove that Dr. Jameson did *not*, as Mr. Labouchere contended, request Lobengula to punish Gomalla's people for cutting the tele-

graph wires. On the contrary, he said he (Dr. Jameson) would punish the offenders himself.

Mr. Selous regrets, with great warmth, the attacks made on the reputation of the late Captain Lendy. On the story of his shooting down the retreating Matabele because they had not crossed the border in an impossibly short time, Mr. Selous produced these notes which were taken down by Mr. Philip Wrey at the interview: "Dr. Jameson, after telling the head Induna that if he could not control his young men the best thing he could do was to leave them to him, and he would soon put them to rights, then said to Manyon: 'Go back to those amongst your people whom you can influence, and start home as soon as you can. Within two hours I shall send my men to see if you have started; if I find you have not I shall drive you over the border.' No words," proceeds Mr. Selous, "were ever spoken that could possibly bear the interpretation that a certain boundary was to be reached in a certain time. What Dr. Jameson required was an immediate withdrawal by the Matabele from the vicinity of Victoria. When, about two hours after the interview, Captain Lendy rode out with thirty-eight men to see if the Matabele had withdrawn, he found the young Induna of Ingna, whom Mr. Wrey describes as having shown every sign of suppressed rage during the interview, in the very act of besieging a small Mashuna village only three and a half miles from Victoria township."

THE EFFECTS OF THE WAR.

Mr. Selous predicts as consequences of the war "the resumption of enterprise, and the successful and continuous development of both Mashunaland and Matabeleland," and in all human probability, the eventual supremacy of the British race and the English language in the eventual confederation of all the States of South Africa south of the Zambesi. "The effect of the Matabele War, though it may have been prejudicial to the happiness of the military caste in Matabeleland, has been directly beneficial to every other native race in central South Africa, whilst, what is of far more importance, it has regained for Englishmen the prestige that was lost amongst whites and blacks when Sir Evelyn Wood was ordered to make peace with the Boers after the defeat of Majuba Hill, has insured the peace and security of Mashunaland, and reduced to a certainty the eventual supremacy of the British race as the dominant people in South Africa."

PROFESSOR A. A. W. HUBRECHT has an article in the February number of *De Gids* on "A Dutch Scientific Expedition to Central Borneo." In the course of his article he sketches the history of the exploration of Borneo by Muller, Schwaner, Ida Pfeiffer and others; he traces the events which have led to the formation of the present expedition, describes what it is intended to accomplish and reminds his readers of the advantages which have accrued to North Borneo from their scientific activity in that district.

PROVIDENT LOAN SOCIETIES.

THE introduction in the New York Legislature of a bill to incorporate a pawnshop to be controlled by philanthropists acting wholly for the interests of borrowers has aroused much interest in the project, to the encouragement of similar action elsewhere. The *Charities Review* presents an interesting account of several European institutions of this character which are under public control.

THEIR OBJECT.

"The object of these philanthropic institutions was and is to make small loans to the poor. These institutions (existing in many cities of Italy, Spain, France, Austria, Germany, Holland, etc.) are under government or municipal supervision. They advance money to anybody against wearing apparel and other easily movable articles of daily use for not longer than one year. The rate of interest is fixed just high enough to cover the expenses connected with the keeping of the pledges and the regular running expenses (including a moderate return on the required capital) necessitated by the rather laborious work. Of course, the larger the capital of such an institution and the larger its business, the lower can be its interest charge, as there is a certain minimum of salaries and office rent, etc., which has to be incurred, however small the transactions may be.

"The countries cited above have all passed general laws regulating the routine and charges of these public pawn institutions, and there are some cities which actually do the business at a loss, for which the citizens think they are largely compensated by the good done."

THREE SUCCESSFUL LOAN SOCIETIES.

Details are given of the work conducted by the "Mont de Piété" of Paris, but the writer attaches more importance to the results of the operations of the Royal Pawn Office in Berlin, where the conditions are more like those of New York City, the Prussian law allowing private pawnbrokers to charge at the rate of 24 per cent. per annum, whilst the law of the State of New York allows them to charge at the rate of about 30 per cent.

"In the year 1889-90, the Royal Pawn Offices of Berlin loaned 5,000,000 marks (\$1,200,000) on 240,000 objects; average amount of loans, 21 marks (\$5). Inclusive of renewals from previous years, its total transactions amounted to about 10,000,000 marks, or \$2,400,000. The smallest amount loaned was 2 marks, or 50 cents.

"The maximum rate of interest to be charged by this and all similar institutions in Prussia is fixed by law at about 12½ per cent. per annum. The Berlin Royal Pawn Office charged, on an average, from 1888 to 1889, 10½ per cent. per annum."

Attention is also called to the experience of the "Workingmen's Loan Association" of Boston, which now has a capital of \$90,000, and loaned last year \$120,000 on chattel mortgages.

The writer concedes that "under our democratic form of government and under existing political conditions, the State or the city, as such, can, for obvious reasons, not assume the management of establishments for lending money on pledges, nor should they be asked to do so.

"But why should not a number of public spirited and philanthropic citizens combine to form a society for that purpose? Why should not a society, formed on the plans outlined above, and profiting by the experience gained elsewhere, succeed in achieving the ends in view as a business enterprise? We believe that, 'ceteris paribus,' any undertaking that can be carried out successfully elsewhere ought also to succeed in New York City."

PEOPLE'S BANKS.

IN the *Gentleman's Magazine* for April, Mrs. E. M. Lynch publishes an earnest plea for what she describes as brotherly banking, a subject which, for some years past, she has made her own. Mr. Wolf's little book upon People's Banks is one among many which she has laid under contribution. Her chief illustrations, however, are drawn from her own investigations on the continent, and especially in Italy, which may be regarded as the fatherland of People's Banks. It certainly does seem strange that co-operative banking should not have obtained a foothold in this country where co-operation in other forms has been so much preached about and practiced.

Germany, says Mr. Wolf, by the help of her People's Banks raises annually somewhere about \$750,000,000 to circulate in commerce. Austria raises \$125,000,000 or more, and even "Darkest Russia" about \$10,000,000.

Some idea of the benefits which can be derived from the establishment of People's Banks may be gathered from the following fact for which Mrs. Lynch vouches: "In Mentone, where the normal rate of interest charged by the banks on loans was 12 per cent. ten years ago, an eight-year-old People's Bank has brought down the bank rate everywhere in the town to 6 per cent."

HOW TO FORM THE BANKS.

How can these popular banks be formed? Mrs. Lynch, as a practical Irishwoman, enters into particulars. The best way to start popular banks, as with any other institution, is to commence at the beginning on a small scale at first. Mrs. Lynch says: "In store founding it has been proved that fifty one-pound shareholders supply enough capital with which to start a village store. And in France, for a town of 11,000 inhabitants and for the surrounding rural district, a most successful bank was started with a capital of \$4,000, while Raiffeisen started his grand Loan Bank with a borrowed \$1,500. Whether for the store or the bank, there must be a limit to the shareholding capacity of each member, else the venture might cease to be a co-operative undertaking by being bought up by a *clique* who would 'run' it on com-

petitive principles—principles the very reverse of 'brotherly.' Another guarantee against such a catastrophe is in the careful selection of members. The greatest safeguard against the danger indicated is to be found in a course that has been largely approved—namely, the limitation by statute of the dividend to 5 per cent.

"At the preliminary meeting, if things go well, the shares will all be subscribed for. The chairman of the board will be chosen from among the best liked and most trust-compelling men in the place. The board will be elected, and it will have as little as may be of a party character. Then, later, this board will elect the managing director. He is the keystone of the banking arch, and success largely depends on a right choice here. There will be plenty to do for the quarterly or biennial general meetings and for the weekly conferences of the board; but it will be the managing director who will cut out the work for all these bodies. He will propose operations in all departments of business—loans, bill-discounting, investments for spare capital, etc.; but the board must ratify his decisions before they can take effect. There will probably be a Watch Committee to oversee all the bank's operations. In France and Italy the liability of shareholders is strictly limited to the amount of their shares. The German *Volksbanken* are wedded to 'unlimited liability,' and their advocates say that it is to 'unlimited liability' they owe the happy fact of no Volk's Bank ever having broken! Most People's Banks balance their accounts every day, and all comers may know how the business is going, if they care to inquire. On one point all these banks unite—the eschewing of all speculative investments. The young corporation, if wise, will make its headquarters in modest premises, and its small staff will be profit sharers in the undertaking."

Mrs. Lynch concludes her paper by giving an account of co-operative creameries which have been operated successfully in Ireland.

IS IT RIGHT TO TAKE INTEREST?

THIS is an old question, but it is being discussed to-day with new knowledge and new earnestness. Part of the new knowledge consists in the recognition of the very oldness of the question. "The ecclesiastical treatment of usury" is the theme of a very instructive historical sketch by Mr. Henry C. Lea in the current number of the *Yale Review*. By usury, Mr. Lea reminds us, was meant not exorbitant interest merely, but "any charge or profit whatsoever arising from the loan of money" or wealth. "There is ample scriptural warrant for the prohibition of all such gains. The Hebrew lawgivers strictly commanded that all loans should be made without the exaction of increase. In the New Law there is less insistence on this, evidently because it was accepted as a matter of course in the precepts which inculcated the brotherhood of mankind and the principles of universal kindness. Naturally the early fathers condemned it with a unanimity which renders

special reference superfluous. . . . The earliest codes of discipline tell the same story. When in the twelfth century canon law began to take a definite shape, Gratian collected a store of extracts from the fathers and councils to show how impious is usury. . . . When S. Ramon de Peñafort in 1,234 codified the new canon law in the official compilation known as the Decretals of Gregory IX, the collection of decrees on the subject of usury which he embodied shows how earnestly the popes had been endeavoring to suppress it and how ineradicable it proved. . . .

"Thus the infallible Church had exhausted all its resources. To make gain of any kind by the loan of money or of money's worth was a mortal sin; to deny this was a heresy, punishable by burning alive if persisted in."

Usury was declared to be worse than theft; even mental usury—the unexpressed hope of the lender that the borrower would add something as a free gift to the repayment of the loan—was denounced as a mortal sin. As a result, the Jews who were not under ecclesiastical law, and such others as disregarded priestly threats, drove a thriving trade. A French ordinance in 1206 forbids the Jews taking more interest than 43½ per cent. per annum.

EXCEPTIONS AND EXEMPTIONS.

Methods of evasion of the canon law became numerous. Roman bankers, supposed to be in partnership with the Curia, loaned money, which was to be returned with penalties. Church loans to needy nobles in Germany were allowed to draw a certain ground rent from the lands offered as security (*census, zins*). *Montes pietatis, monts de piété*, or public pawnshops, started by Fra Bernardino da Feltre in the fifteenth century as a boon to the poor, had to levy a small charge to meet working expenses, and were allowed to do so by the papacy. Charges on loans to governments were (like *census*) allowed, as being an annual rent from the securities accepted in lieu of the loan. Compensation was also allowed for a loan, if the granting of it for charity prevented the lender from making profit by it elsewhere (*lucrum cessans*), or caused him material injury (*damnum emergens*). Freedom from canon law helped the expansion of the trade of Protestant England and Holland in the eighteenth century. Then noted Catholic casuists released confessors from the duty of demanding from money lenders restitution of their usurious gains in all cases. In response to many pressing appeals in the nineteenth century the Holy See has simply required the faithful to promise obedience to such decision as it shall hereafter make on the question of the lawfulness of interest, and allows absolution without insisting on restitution where his promise is made. The latest utterance is one by the Holy Office, December 18, 1872, by which it was ordered that those who take 8 per cent. per annum "are not to be disturbed."

Mr. Lea, it will be seen, takes the usual Protestant view of regarding these distinctions as mere casuistical evasions of canon law.

WHAT DR. BARNARDO HAS DONE.

IN the *Sunday at Home* for April Mr. W. J. Gordon publishes a brief but earnest appeal on behalf of Dr. Barnardo, of whose wonderful philanthropic work he gives a condensed account. Mr. Gordon is a practical man, and he tells his readers exactly what to do if they wish to help:

Send \$50 to Dr. Barnardo and you will defray the entire cost of emigrating a boy or girl and placing him or her in suitable employment in Ontario, including outfit, rail fares and ocean passage. Send him \$67 and you defray the entire cost of supporting a boy or girl boarded out in some rural district. Send him \$80 and you support a healthy child in his homes for a year. In short, a child is fed, clothed, lodged, and educated in Dr. Barnardo's homes for less than tenpence three farthings a day.

THOUSANDS OF CHILDREN EDUCATED, FED AND CLOTHED.

Dr. Barnardo has received from the public about a million and a half of money during the last twenty-seven years. The following is Mr. Gordon's account of what he has done with it: "He has secured, trained, and placed out in life 21,579 children; he has educated and partly fed and clothed in free day and night schools children not actually destitute to the number of 60,871; he has provided outfit, passage money, and effectual supervision for 5,737 emigrants to the colonies; he has established four free lodging houses, and given homeless women and children 100,301 free quarters and 442,766 free rations; he has established four industrial brigades, and aided to an independent livelihood, 4,893 of the boys who have passed through them; he has sent 2,320 sick children to his seaside homes; and he has provided 1,118,926 free hot breakfasts and dinners during the winters to children of the laboring class out of work. He has established six mission halls, in which he has had 10,000,000 attendances; he has also established two coffee palaces, in which he has refreshed and entertained 5,000,000 people; he has organized a guild of deaconesses whose house-to-house visitations exceed 20,000 a year; and last, but not least, he has founded a free medical mission, in which thousands of cases are dealt with and an enormous number of prescriptions are dispensed annually. Out of \$6,355,000 he has spent on buildings—homes, schools, hospitals and convalescent retreats—on freehold sites first acquired (all of which sites and buildings have from the very outset been handed over to trustees) only \$935,000, and in addition to this he has freehold land and buildings in Canada to the value of \$105,000.

"Every year his work increases, and as his good report goes all over the world so do the subscriptions come in from the uttermost corners of the earth. Last year he had 74,500 separate donations; and 49,000 of these were in sums under a sovereign, and not 1,900 were over \$50. The increase in his revenue is as regular and continuous as its distribution. Last year he dealt with 8,947 fresh cases of waif children, and maintained and educated 6,949 children in his

homes. On the 31st of last December he had 4,705 children in residence, and 2,085 boarded out under his care; and his death rate for the year was only 6 per 1,000."

THE RIGHTS OF TRAMPS.

MR. ELBERT HUBBARD, in the current *Arena*, comes to the defense of the manifesto issued by Governor Lewelling, of Kansas, for the protection of tramps against arrest and detention. After discussing the origin of the various vagrancy laws of the States, which have been derived, he finds, from the common law of England, Mr. Hubbard describes the "tramp law" of Delaware and other States, which provides that "Any person without a home in the town in which he may be found wandering about without employment, shall be deemed a tramp and dealt with accordingly."

"Section 2 provides that it shall be the duty of all officers of the peace to arrest tramps wherever found. These tramps are set to work for terms varying from one to thirty days, but can be immediately rearrested on being discharged. It is generously provided that this stranger, who has no home in the town and who is looking for employment, can appeal from his sentence and demand a jury trial on giving bail to the extent of \$500."

TRAMPS AS THEY ARE.

"I make no defense of trampism nor vagabondage. I have lived with tramps and traveled with them for days; I know their ways, manners, and habits. As a class they are not honest or truthful. Their way of living is not to be commended. But among them I have found honest men, unfortunate men, men of good hearts and generous impulses. Among tramps there are rogues and many of them. A tramp may be a criminal and he may not. If he is a criminal punish him for his crimes, but do not punish him for being a tramp; to do this may be only to chastise him for his misfortunes."

WESTERN TRAMPS.

"The tramp of the West is a much better article than the tramp found about Eastern cities. There is an army of tramps that start in every June in Arkansas and move northward with the wheat harvest. These men work, often irregularly, but they are a positive benefit to the farmers rather than a disadvantage, and many farmers in Kansas recognize this fact."

"During the past year great numbers of men were thrown out of work in Colorado, Montana and Nevada by the closing of mines. Many of these men had very small means and they sought to reach friends in the East. They came into Kansas by hundreds, and those who were hungry and penniless were criminals in the eyes of the law. Not all police officers are dead to pity, nor are all justices unjust; but in many places innocent men were thrown into prison, insulted, disgraced, robbed of their time, because the price of silver was so low that it no longer paid to mine it. Instances of cruelty in the name of law came to the

attention of Governor Lewelling, and paraphrasing Burke he said, rightfully: 'The great State of Kansas cannot afford to indict a whole class when they are what they are through a calamity; I will exert my influence to protect the innocent.'

"The mines are now starting up again, and in a few months thousands of workmen will be needed; poor men will leave the large cities in great numbers to reach the world of wealth that sleeps beneath the Rocky Mountains. These men will cross the splendid State of Kansas, and, thanks to Governor Lewelling, they will not be regarded by the State as criminals."

THE BEGGARS OF PARIS.

IN an article in the *Chautauquan* M. Louis Paulian, Secrétaire-Rédacteur of the French Chamber of Deputies, gives a brief description of the business of begging as now conducted in Paris. The magnitude of the evil may be partially appreciated after reading M. Paulian's estimates, formed as the results of careful investigation. He devoted a dozen years to the work of ascertaining the total amount expended by public and private charity in Paris for the help of the unfortunate.

"I began by totalizing the sums which were expended by the official budgets. I found the public assistance amounted to \$8,000,000 or \$10,000,000 a year. The state, the department of the Seine and the city of Paris raised more than \$400,000 for the succor of the unfortunate. Finally, charitable societies distributed help amounting to more than \$1,500,000 annually. Add to these sums the alms given in the street and you will increase the amount still by about \$1,600,000 a year. How is it that with a budget of charity so fabulous the number of beggars not only does not diminish, but steadily increases day by day?"

Here is M. Paulian's explanation of this strange phenomenon: "Instead of employing our alms to aid the worthy poor, we distribute it in the street and to the people whom we judge unhappy from their type, that is to say from the apparent wretchedness of their garments, from their infirmities more or less real which they display in our sight."

"What is a type? It is the *ensemble* of the distinctive characteristics of a race or of a profession. In order to have the type of a profession it is necessary to have followed it for a long time, to have experienced its exigencies, its habits, its consequences. Take an ecclesiastic or a soldier who for many years has fulfilled the duties and worn the special costume of his calling, and cause him to adopt the civic dress; in spite of the change of clothing his official character will be readily recognized. If then mendicancy is a condition, that is to say if it is of short duration, if it is the result of a passing cause such as an accident or sickness, it would seem that the beggar under his rags ought to preserve the type of the vocation to which he had belonged. But he never does reveal a trace of any calling, therefore mendicancy is not a passing condition, it is a definitive position and the mendi-

cant is of the mendicant type. The existence of this mendicant type ought to put us on our guard against this exploitation. By a strange anomaly it happens on the contrary that it is the very existence of this type which decides us to give the alms it asks of us. A man accosts us on the street, he holds out his hand, we look at him, he is of the mendicant type; that suffices, we conclude that he is unfortunate, that he is suffering, and that he is worthy of our charity.

"Thus the beggars who know this false reasoning of which we are every day the dupes exert themselves to make all possible progress in approaching this ideal type which will inspire in the passers by a profound pity and procure from them large receipts.

"To make believe that he is suffering and, if he really suffers, to increase the appearance of this suffering is the problem which mendicancy is solving. In this age of light when the discoveries of science have permitted the debasing of all human industries, mendicants have not remained in the background; they have succeeded in debasing misery itself.

"I have said that in our days at Paris mendicancy is a profession—in fact beggars have their masters and their rules, they have their restaurants, their clubs, and their places of reunion."

BEGGARS' DIRECTORIES.

The writer describes two very interesting books called *Le Grand Jeu* and *Le Petit Jeu* ("Great Game" and "Small Game").

"Beggars, who are philosophers, reason that just as there is needed a book of addresses for dealers and a book of addresses for people in society, so there is needed a like book for the use of mendicants. The directory of a new kind has been published under the name of *Le Petit Jeu* and *Le Grand Jeu*. The former is a volume which gives the name and the address of some hundreds of charitable men. It costs three francs. The latter volume costs six francs, but it is more complete. Not only does it give a greater number of names, but it indicates the religion, the political opinion, the customs, of persons at whose houses the beggars may present themselves and the means by which these people may be deceived.

M. Paulian tells how he has acquired his information, and this is not the least interesting portion of his article.

"This business I have studied thoroughly. In order to reach a correct opinion I have read all that has been written upon the subject; I have consulted every man capable of telling me anything of it, I have assisted in all of the international congresses in which this question has been discussed, and finally I decided to have recourse to the experimental method, and I became myself a beggar.

"After a few lessons I acquired great experience in my subject, and personated turn by turn a blind man, a cripple, a deaf mute, a paralytic, a workman out of work, a professor out of employment, an organ player, a strolling singer. I have been arrested only once, on May 24, 1891, when in the presence of several journalists I installed myself under the porch of the church St. Germain des Prés. In fifteen minutes

I had received 63 sous. The five women who begged regularly there accused me of taking the bread out of their mouths, and began a conspiracy to have me arrested. Their plan was simple enough. Whenever the policeman passed all five turned and gazed at me as if I were a criminal. This attracted the policeman's notice and the women nodded approvingly as he approached me. I acknowledged that I was begging, but reminded him that I was under the porch of a church and, therefore, he had no power to arrest me. He shook me roughly and bade me move on.

"By begging I was able to secure everything that one can imagine—money, clothing, furniture, railroad tickets, medicines, linen, flour, absolutely all things.

"These experiences have led me to propose a plan of reform which I have already commenced to apply on a large scale in Paris."

THE BOWERY AND THE BOHEMIANS.

MR. H. C. BUNNER contributes to the April *Scribner's* one of his delightful studies of New York life—this timetreating of "The Bowery and Bohemia." He says the "true elder race" of Bohemians is no longer with us; when their existence and their haunts about Washington Square became public and matter for magazine articles they drifted away to more congenial and remote quarters before the invading make-believe throng of imitators.

A PEN PICTURE OF THE BOWERY.

"The Bowery is not a large place, for I think that, properly speaking, it is a place rather than a street or avenue. It is an irregularly shaped ellipse, of notable width in its widest part. It begins at Chatham Square, which lies on the parallel of the sixth Broadway block above City Hall, and loses its identity at the Cooper Union where Third and Fourth Avenues begin, so that it is a scant mile in all. But it is the alivest mile on the face of the earth. And it either bounds or bisects that square mile that the statisticians say is the most densely populated square mile on the face of the globe. This is the heart of the New York tenement district. As the Bowery is the Broadway of the East Side, the street of its pleasures, it would be interesting enough if it opened up only this one densely populated district. But there is much more to contribute to its infinite variety. It serves the same purpose for the Chinese colony in Mott, Pell and Doyers Streets, and for the Italian swarms in Mulberry Bend, the most picturesque and interesting slum I have ever seen, and I am an ardent collector of slums. I have missed art galleries and palaces and theatres and cathedrals (cathedrals particularly) in various and sundry cities, but I don't think I ever missed a slum. Mulberry Bend is a narrow bend in Mulberry Street, a tortuous ravine of tall tenement houses, and it is so full of people that the throngs going and coming spread off the sidewalk nearly to the middle of the street. There they leave a little lane for the babies to play in. No, they never get run over. There is a perfect understanding be-

tween the babies and the peddlers who drive their wagons in Mulberry Bend. The crowds are in the street partly because much of the sidewalk and all of the gutter is taken up with venders' stands, which give its characteristic feature to Mulberry Bend. There are displayed more and stranger wares than uptown people ever heard of. Probably the edibles are in the majority, certainly they are the queerest part of the show. There are trays and bins there in the Bend, containing dozens and dozens of things that you would never guess were meant to eat if you didn't happen to see a ham or a string of sausages or some other familiar object among them. But the color of the Bend—and its color is its strong point—comes from its displays of wearing apparel and candy. A lady can go out in Mulberry Bend and purchase every article of apparel, external or private and personal, that she ever heard of, and some that she never heard of, and she can get them of any shade or hue."

A MODERN BABYLON.

"But it is on the other side of the Bowery that there lies a world to which the world north of Fourteenth street is a select family party. I could not give even a partial list of its elements. Here dwell the Polish Jews, with their back yards full of chickens. The police raid these back yards with ready assiduity, but the yards are always promptly replenished. It is the police against a religion, and the odds are against the police. The Jew will die for it, if needs be, but his chickens must be killed *Kosher* way and not Christian way, but that is only the way of the Jews; the Hungarians, the Bohemians, the Anarchist Russians, the Scandinavians of all sorts that come up from the wharfs, the Irish who are there, as everywhere, the Portuguese Jews, and all the rest of them who help to form that city within a city—have they not, all of them, ways of their own? I speak of this Babylon only to say that here and there on its borders, and, once in a way, in its very heart, are rows or blocks of plain brick houses, homely, decent, respectable relics of the days when the sturdy, steady tradesfolk of New York built here the homes that they hoped to leave to their children. They are boarding and lodging houses now, poor enough, but proud in their respectability of the past, although the tide of ignorance, poverty, vice, filth, and misery is surging to their doors and their backyard fences.

AND HERE DWELLS THE MODERN BOHEMIAN.

"And here, in hall bedrooms, in third-story backs and fronts, and in half-story attics, live the Bohemians of to-day, and with them those other strugglers of poverty who are destined to become 'successful men' in various branches of art, literature, science, trade, or finance. Of these latter our children will speak with hushed respect, as men who rose from small beginnings; and they will go into the school-rooms of our grandchildren along with Benjamin Franklin and that contemptible wretch who got to be a great banker because he picked up a pin, as ex-

amples of what perseverance and industry can accomplish."

THE MYTH OF THE ABANDONED FARM.

AN unusually useful paper is printed in the *Century* discussing the task of "Hunting an Abandoned Farm in Connecticut," by William Henry Bishop. Mr. Bishop tells how these New England country sites have become the favorite resorts of many famous people, some of whom have settled here after hunting the world over for the most picturesque and comfortable spot to live in.

In fact Mr. Bishop begins with an explanation that there is no such things as abandoned farms in New England, and he proves this assertion by a long list of entertaining experiences with "places" viewed in the light of possible purchases.

"At the time of unusual farm depression three or four years ago, when the abandoned farm, now so familiar, first began to be heard of, the leading New England States issued lists of such property, hoping to remedy the evil, and they have from time to time put forth new editions. Massachusetts is the only one, however, that admits the word 'abandoned' into the title of its pamphlet. This is called 'A Descriptive List of Farms in Massachusetts Abandoned or Partially Abandoned.' Connecticut, perhaps to save the feelings of owners and to uphold the reputation of its territory, simply calls her own, 'A Descriptive Catalogue of Farms for Sale.' So, too, Vermont has only 'A List of Desirable Farms at Low Prices,' and New Hampshire phrases it merely, 'Secure a Home in New Hampshire.' Yet, when I came to know the field, I did not find any such great amount of euphemism in these titles after all, for while it is well enough to call a spade a spade, there is no need of being so plain-spoken as to call a thing a spade which is nothing of the sort.

"Let me set down here at once, after an extended tour of inquiry, my conclusions as to the abandoned farm. It is a pure figment of the imagination; it is a moving text for statisticians of a sentimental turn and newspaper paragraphers who have never been out to see the facts for themselves—it does not exist.

"In reply to my written application, Rhode Island made answer, with conscious pride, that she had no such catalogues and no such farms. Maine has prepared a few figures in one of the reports of her Board of Labor, wherein the large number of 3,398 abandoned farms is spoken of (this was in 1890), but these were not identified in such a way as to be located and visited, and I was obliged, by my experience elsewhere, to be doubtful even about Maine. New York and Pennsylvania made the same reply as Rhode Island. New Jersey conceded a very few such farms. Some of the Southern States did not reply at all, and South Carolina said that there were within her borders a great many small tracts, taken for taxes, which would be sold for from 50 cents to \$1 an acre, but well improved land was scarce, and commanded from \$4 to \$20 an acre.

"When I had got together all the catalogues, I pro-

ceeded to lay out my plan of campaign. In the first place, I confined it to New England, already a vast, formidable domain. I had before me, as enumerated in the lists, 318 farms for Connecticut, 887 for Massachusetts, 317 for New Hampshire, and 200 for Vermont, 1,722 in all. Or the total would reach 5,120 if one wished to take pains to look up also the very large number in Maine, about which I think it a great pity we have not more specific information. It was obviously impossible to visit all, as there are so many other things in a human life to do besides settling this problem, however interesting. I purposed, therefore, to select a certain field which should offer unity of character. This was found in the hill-country of western Connecticut, the Berkshires of Massachusetts, the Green Mountains of Vermont, and the White Mountains of New Hampshire. I confined myself, in fact, chiefly to this line. Next I tried to select typical places. I marked especially the cheaper places, for when you are looking for an abandoned farm, it is reasonable to ask that, even if it be not abandoned, it shall at least be cheap. I crossed off those offered at \$7,000, \$10,000, and even as high as \$18,000, as having no place in this inquiry. Enterprising owners had taken advantage of the issue of the catalogue to insert free advertising for their property. In general, too, even the cheaper places offered were held at about the prices ruling for similar farming property round about, unless they were depreciated for some private and local reason—as a desperate pressure on the owner to sell, or, more often, because of their lack of intrinsic worth.

And then follows Mr. Bishop's experiences with a force that leaves no doubt as to the accuracy of his exposure of the myth.

ELECTRICITY AND OIL IN WARFARE.

IN the April *Atlantic* Mr. Joseph L. Brent writes on "War's Use of the Engines of Peace" and proposes some novel defensive and offensive plans. He points to the ineffective results of the usual attempt to close up waterways with land batteries—a means which failed in such notable instances as at the Mississippi's mouth in the Civil War, and, later, at the port of Rio Janeiro in the Brazilian struggle just ended.

Torpedoes should be and are used, but they are not final, and it seems to this writer that a British force might annihilate the great cities of our northern boundary by steaming down the Canadian waterways.

FIGHTING WITH ELECTRICITY.

"Electric currents of enormous energy, capable, under the condition of actual contact, of destroying life in any number of men exposed to it, and possibly ships of war also, can be generated at points thirty miles or more distant from the localities where they are expected to be used, and be transferred there with inconsiderable decrease of power. Inflammable oils can be conveyed through pipes by gravitation, or

pumps working, if necessary, twenty miles from point of discharge, and after discharge can be instantaneously ignited whenever desired, and, when discharged upon or under water, will float and burn upon its surface.

"Thus, electricity and inflammable oils meet the primary consideration of possessing centres of supply and activity remote from the enemy, and of developing powers capable of almost instantaneous transmission to points where they could operate effectively against an enemy, with a continuous renewal and supply of power; and therefore currents of electricity and inflammable oils, separately or jointly, are well adapted for use in defensive war."

In fighting on land Mr. Brent would have his electric batteries carried on railroad trains, arguing that as things are now all important campaigns are conducted in close connection with transportation lines.

OIL AS A NAVAL ENGINE.

He is even more sure in the case of inflammable oils used in defending land positions against naval attack.

"Let us consider, for example, a plan for the defense of the Mississippi River. The Eads jetties have for a considerable distance narrowed the width of the channel at its mouth to about four hundred feet, and inflammable oil, pumped or discharged from remote points, could easily be made available, even at the moment of attack, to sheet with oil the surface of the narrow channel, ready to be ignited when desirable, and to be carried forward by the current against any approaching hostile ship. From New Orleans to its mouth the river varies in width one thousand yards, more or less. At selected points remote from attack, when a hostile fleet would seek to ascend the river, from either bank could be discharged inflammable oil in ample quantity, ready, at the touch of an electric button, to burst into flames and be carried by the current against the enemy.

"It would be impossible to ascend the river under these circumstances. What width of channel could be protected by fire defense cannot be stated with accuracy, as no exact data are available; but the capability of pumps is great and the oil supply ample, so that many points beside the Mississippi River could be barred by flames against ships. Most rivers could be, and also those ports where narrow and winding channels are the only means of entrance. Numerous ports and rivers, at home and abroad, could be indicated. The approaches to Constantinople and the Suez Canal might, amongst others, be barred by flames. It is probable that, at the trifling cost of a connection with the oil pipe lines, many of the channels leading into New York could be so barred, especially those entering by East River. There is now a width of only one thousand feet at low water from deep water below the Narrows to deep water beyond the bars. The winding channels at Galveston and in Detroit River possibly could be thus defended, and many others beside."

A CIRCUMNAVIGATORY CRUSADE.

Tying the White Ribbon Round the World.

ONE of the most striking conceptions ever framed for a pilgrimage of propaganda is announced in the *Review of the Churches*. Seven years ago Miss Frances Willard hit upon the idea of presenting, by special delegation, a polyglot petition from the womanhood of the English-speaking race to all the governments of the world against the traffic in alcohol and opium, and against State regulation of vice. The petition has been signed by over two million women, and by societies numbering more than a million members. Lady Henry Somerset and Miss Willard now propose to go literally round the world as the petitionary delegation. Dr. Henry S. Lunn has, at their request, undertaken to organize this planet-circling demonstration. He declares he has no doubt of securing a sufficient number of persons desirous of accompanying them to justify him in chartering a special vessel to take them round the globe. The expedition, it is suggested, would start from the Annual Convention of the W. W. T. U. to be held next November at Cleveland, Ohio. It would cross the Atlantic and join the British contingent at Exeter Hall. The subsequent route lies through Rome, Naples, Athens, Jaffa, Jerusalem, Bethlehem, Jericho, Alexandria, Cairo, the Pyramids, Suez, Madras (during the National Congress), Colombo, Penang, Singapore, Bangkok, Perth, Albany, Adelaide, Melbourne, Hobart, Sydney, Brisbane, Hong-Kong, Shanghai, Yokohama, Vancouver. The campaign in India and Australia promises to form the chief feature of the tour. Presentation of the petition to potentates will take place all along the line of travel; but propaganda among the peoples will probably produce the more permanent impression. Any man or woman is eligible to join the party who presents a suitable letter of introduction along with application to Dr. Lunn.

THE LIFE OF A DIVER.

GUSTAVE KOBÉ makes a capital article in the April *Scribner's* from his account of an interview with an experienced professional diver.

THE DRESS OF A DIVER.

The under water worker referred to describes the paraphernalia of his profession as follows:

"A diver's armor consists of a helmet of copper, a collar of the same metal into which the helmet is screwed, a dress of soft rubber and canvas, and iron shoes weighing fourteen pounds each. There are also eighty-pound weights on the chest and back—'horse-shoe weights' we call these, to distinguish them from weights which we sometimes wear around the waist. The helmet is roomy, and has a face-plate and a valve through which superfluous air escapes into the water. You can locate a diver by the bubbles which this escaping air drives to the surface. The apparatus

above water consists of the air pump, from which a strong hose leads to the helmet. A two-inch life-line is attached to the diver. In winter we wear heavy flannels under our

HOW SIGNALS ARE MADE.

"Over hose and line the diver converses with his tender through signals, those above the hose relating to the air-supply. When there are three jerks at the life-line the tender never stops to answer, but hauls up at once. Three jerks always mean desperate peril—usually death. Fortunately, I have had to give them but once, and being in shallow water was brought to the surface before the fearful pressure killed me. But I felt as if my head were between hydraulic jacks. The supply of air had suddenly stopped. Examining the apparatus, we at last discovered a lot of paper balls in the hose. They had probably been dropped in by mischievous boys, who little knew that they were jeopardizing a man's life."

Some people can work at a far greater depth than others—the ability varying with the state of the physical system. Often apparently hearty men will suffer from bleeding at the ears and nose from the pressure at twelve feet. Capable divers consider one hundred and twenty feet as about the practical limit; a man worked in Lake Ontario at one hundred and forty-five feet, but was paralyzed for life.

A diver demands for this dangerous service from ten to thirty-five dollars per day—a day consisting of four hours.

AMONG THE WRECKS.

"Divers, when ready to come up from a wreck, must exactly retrace their steps, otherwise they are apt to get tangled up. For instance, if in working his way to the hold the diver passed to starboard of a mast, he should pass on the same side in working his way back, otherwise his line and hose will catch around the mast. To get tangled up below is a terrible predicament for a diver. There is but one thing he can cut—the life-line, for they can lower him another. But I have known divers become so desperate when tangled up that they have lost their heads and cut the hose—which meant death. A cargo of barrels is dangerous to break out, because they are apt to float up when you have loosened them and get foul of your hose. I once had a barrel with an iron chine jam my hose against the ceiling, and for a time it was a question whether I or the barrel was master of the situation. Jute is also a bad cargo to handle, because it tangles itself about a diver's legs, so that often it will take him several hours to clear himself. When a sunken vessel is to be raised, the diver passes the pontoon chains under her bottom. Work on vessels sunk in New York Harbor is often dangerous on account of the swift tides. When the current runs over three miles it is unsafe for a diver to remain below. His hose may snap, or line or hose become entangled in the rigging. The channels about Governor's Island and Hell Gate are spots in the harbor where divers can work only at slack water.

THE PERIODICALS REVIEWED.

THE FORUM.

IN our department of "Leading Articles of the Month" will be found reviews of the article by "An Independent," on Mr. Cleveland's administration, of "Lord Rosebery and the Liberal Crisis," by Castell Hopkins, of Gandhi's "Christian Missions in India," of Theodore Roosevelt's "What 'Americanism' Means," and of J. W. Gleed's discussion of the comparative degrees of civilization attained by New York and Kansas.

AMERICAN ACHIEVEMENTS IN SURGERY.

Dr. George F. Shrady treats of the recent advances made in the surgeon's art from a strictly American point of view.

"It would be difficult to enumerate what has been done by Americans in the matter of devising new instruments for the easier and more successful performance of surgical operations. Not only in the creation of new things, but in the useful modification of old ones, the ingenuity of the American practitioner is most strikingly manifest. Simplicity and effectiveness are the main objects aimed at in this line. In these two particulars it is safe to say we excel all other nations."

"HAS THE INTERSTATE COMMERCE LAW BEEN BENEFICIAL?"

Colonel Aldace F. Walker, after a thorough discussion of the merits and demerits of the Interstate Commerce law, reaches this conclusion:

"The Interstate Commerce law in many ways has been beneficial to business interests, but in its present form there is little value now remaining beyond the assertion of important general principles; while in some respects it is more prejudicial than beneficial. It demands both steadiness of rates and active competition, things which, as Judge Cooley once said, necessarily kill each other. It is like requiring boys to play football under a rule forbidding the players to touch one another. The prospect of anything more than superficial action under our present legislative system is unfortunately quite remote. Senators and Congressmen appear to regard the subject of our domestic commerce as a kind of butterfly net wherewith to entrap the fluttering voter as he wings his way from party to party. Let us hope that public opinion will soon awake to the necessity of action for the preservation of the American railway system."

"HAS FARM MACHINERY DESTROYED FARM LIFE?"

Mr. E. V. Smalley treats of the effect of the introduction of labor-saving farm machinery, combined with the resultants of other important changes in agricultural methods and conditions. After the pros and cons have been fully stated, Mr. Smalley believes that the outlook, on the whole, is encouraging.

"I believe that we are now in a transition period in agriculture. The influence of machinery has been fully exerted. It is doubtful whether the next century will see any important new inventions that will further eliminate the man from the land and do his work with cog-wheels, levers and knives. There are no more fertile lands on the globe to be conquered by civilization and to increase the food supply. With growth of population will come better prices for farm products. Farm life will become more attractive. The tendency to large farms will be checked. A hundred acres, even with exclusive grain

farming, will afford a good living to a family. Better times for American agriculture are not far off."

UNIVERSITIES AND THE TRAINING OF TEACHERS.

President G. Stanley Hall reviews the work that has been done by universities in this country up to the present time, and outlines some of the problems of the immediate future in the educational world.

THE NORTH AMERICAN REVIEW.

"PERSONAL Reminiscences of the Vatican Council," by Cardinal Gibbons, and "New Parties in Parliament," by Justin McCarthy, are reviewed in our department of "Leading Articles of the Month."

"TARIFF REFORM AND MONETARY REFORM."

President E. B. Andrews discusses the tariff and the monetary problems of the day in a single article.

"The fundamental truth on which the policy of tariff reform is based is that the world of commerce is by nature a continuous unity. Any measure or system which tends to hedge it off into districts or departments is more or less artificial, and therefore, if justifiable at all, justifiable only on account of some temporary stress or other circumstance foreign to the normal order of society."

Starting from this principle the writer undertakes to show that at the present time tariff reform depends upon monetary reform.

"AN ANGLO-AMERICAN ALLIANCE."

Mr. Arthur Silva White proposes the following draft of an Anglo-American alliance:

"Great Britain shall become an ally of the United States in the event of any European power or powers declaring war against the latter. On the other hand, the United States shall guarantee friendly neutrality in the event of Great Britain becoming involved in a war with one or more of the European powers concerning issues that in no way concern the pacific interests of the United States; and, under such circumstances, the United States shall render to Great Britain every assistance, positive and negative, allowed to neutrals."

"HOW WE RESTRICT IMMIGRATION."

Dr. Joseph H. Senner, United States Commissioner of Immigration, makes an interesting statement as to the present status of immigration.

"Immigration has practically come to a standstill. We have to look back beyond the year 1880 to find figures so low as those for the months of January and February, 1894. If we take into consideration the unprecedented number of emigrants from the United States to Europe since August, 1893, and the fact that an exceedingly large portion of all the recent immigrants has consisted of mere relatives (members of the same family) of residents of this country, we may well state that immigration has substantially ceased."

"THE SUPPRESSION OF LAWLESSNESS IN THE SOUTH."

Governor Stone, of Mississippi, in concluding an article on Southern lawlessness, writes as follows:

"The most gratifying feature in the situation is that the trend of public thought and action is steadily in the direction of justice and fair dealing, while there is nothing in view to indicate retrogression. On the contrary, everything promises a continuance of the improvement

in the relations between the races, and the continued moral and material advancement of the people."

OTHER ARTICLES.

The Hon. Wm. F. Wharton, in his article on "Reform in the Consular Service," makes a strong plea for tenure of office during good behavior and better compensation.

Charles H. Cramp asserts that the only reasons that exist for the repeal of our navigation laws are English reasons—in other words, that all the benefits from such repeal would accrue to Great Britain, and not to the United States.

Mr. Clemens enlivens the pages of the *Review* with a "private history" of his famous "jumping frog" story, and brings to light the remarkable fact that his Calaveras County narrative was anticipated by the ancient Greeks.

Robert A. Pinkerton describes the profession of forgery at some length, and declares that the American forger is the most expert of his class in the world.

THE ARENA.

ELBERT HUBBARD'S article on "The Rights of Tramps" has received notice in another department.

TENNYSON'S RELIGION.

The Rev. W. H. Savage writes appreciatively of the Laureate's religious views.

"No man of our time faced the conclusions of scientific inquirers and the evils that seem to deny the high hopes of the soul with a clearer eye and a fuller comprehension than did Tennyson. No man felt the burden of the world's woes more keenly than he, and yet his religious hope for man and for society never surrendered to his doubt and fear. In his youth he sang 'The federation of the world,' and when he had grown gray amid battles and crimes, that seemed to mock his hope, he could still 'defy augury' and strike his harp to the star-music of a better time to be."

THE CATHOLIC CHURCH AND THE HIGHER CRITICISM.

Mr. Merwin-Marie Snell asserts that the Roman Catholic Church has nothing to fear from Biblical criticism, and will give no aid to those denominations that base themselves wholly on the sacred texts in their struggle against nineteenth-century scholarship.

THE TENEMENT EVIL.

Dr. William Howe Tolman and other experts discuss the "Tenement-House Curse" in a symposium. This is a feature of the *Arena's* plan of presenting in each number a discussion from various points of view of some important question in the field of reform covered by the "Union for Practical Progress," the organization whose objects were explained in the April REVIEW OF REVIEWS.

In "The Liquor Traffic Without Private Profits," Mr. John Koren advocates the Scandinavian system.

AMERICAN JOURNAL OF POLITICS.

IN the current number of the *Journal of Politics*, W. H. Smith makes a plea for the founding of an American Knighthood, while John F. Hume argues in an article on "Our House of Lords," that the adoption of our present Senate was a mistake in our scheme of government; but then, an order of "American Knights" would be a very different thing from our Senate, as everybody knows. Carl Snyder, in the same number, asks the question, "What do the American People Read?" and in answering it arrives at a somewhat pessimistic conclusion. There are two articles on socialism, written from slightly different points of view.

THE CONTEMPORARY REVIEW.

THE steady advance in interest and worth frequently noted of late in the contents of the *Contemporary* is maintained this month. The articles are mostly of a high class and cover a range too wide to admit of their being readily grouped under collective headings,—always a good test of variety. Noticed elsewhere are papers by Mr. Massingham and Dr. K. Spence Watson on the change in the Premiership, and one by an anonymous Catholic on the Pope's encyclical concerning the Bible.

"THE FALLACY OF UNEARNED INCREMENT."

The Duke of Argyll replies to Lord Hobhouse on betterment, and objects to the principle as a mischievous and impracticable endeavor to distinguish between increments of value directly due to the individual's own action and those indirectly due to the general progress of society. J. S. Mill's idea of unearned increment is a "most marvelous" fallacy, a relic of the old fallacy that labor created all value. "All articles equally rise and fall in value from causes with which the owner, or producer, has nothing whatever to do, causes which he has done nothing to set in motion, and which very often he could not even foresee. . . . Wages rise and fall from the action and from the desires of other men with which the laborer has not the remotest connection. . . . If no increments of value are to be recognized as 'earned' except those which arise directly from some work done by the owner with or upon the article which is affected, then the doctrine applies to the whole world of industry and of commerce. It has no more application to ground values than to all other values of every kind."

THE OUTCOME OF AGNOSTICISM.

Madame E. M. Caillard in a very valuable article seeks to trace the "universal sequence of capacity and response to capacity in a region from which agnostic thought has excluded it—in other words, to show that a revelation of the Divine to the human is as reasonable and as much to be expected as the revelation of light to the eye, because there is as true a capacity and response to capacity in the one case as in the other." As the outcome of present agnosticism and strife she points to "a more general and at the same time a more individual 'consciousness of union with Christ and through Him with God' than has ever yet been attained in any age, save by exceptional Christians."

OTHER ARTICLES.

Mr. Edmund Gosse glorifies as a poet M. J. M. de Heredia, the recently elected French academician, "who has not cared to move an inch from his path to please the many or the few, who has spent half a life time in the pursuit of a splendid perfection, a faultless magnificence in concentrated and chiseled verse." Archdeacon Farrar objects to "the almost universal fashion" of regarding total abstainers as fanatics or pharisees, and argues the reasonableness of their action on grounds of economy, precaution, health, and regard for one's neighbor. But he "seeks to persuade none." Professor H. D. Müller describes the results of excavations at Sendschirli, a Kurdish village in northern Syria, including a monolith (with inscriptions) of Esarhaddon, of date 670 B.C., and inscriptions in old Semitic, dating from the eighth and ninth centuries B.C., the oldest being ascribed to the Hittites. Mr. M. G. Mulhall shows the fearful excesses in expenditure which brought about the Italian crises. Here is one typical fact: "The collective steam power of her war vessels is 530,000 horse, while that of all the factories, mines and workshops in the Kingdom is only 152,000."

But with careful administration of her finances, he concludes, from the progress she has already made, that Italy has a great future before her.

THE NINETEENTH CENTURY.

THE April number, fresh and entertaining as a whole, is specially strong in politics. Mr. Frederick Wicks' statistical investigation into the actual importance of the Trades Union vote, opens up an interesting branch of electoral research. The seven contributors on the problem of the Peers find separate mention.

GOETHE'S MOTHER.

Frau Aja, as Goethe playfully called his mother, is the subject of a pleasing little character study by Mr. H. Schütz Wilson, in which he remarks: "In the fervor of trust and the comfort of conviction mother and son resembled each other, and her beliefs must have had some influence upon his early feeling. Perhaps her highest and most distinctive quality is just this assured, intense, unshakable faith in God. She seems to have had no clerical assistance, to have relied not at all upon observances and forms, but her happy soul stood in most direct and joyous relations with its Creator. Unlike the majority of religious persons, so-called, she could *rejoice* in the Lord. She was a God-loving rather than a God-fearing woman; and though she knew sorrow, losses, trials, she never felt gloom, despondency, or doubt. There was nothing mean, sour, peevish, in her sunny nature, and she dared to praise God by enjoying all that is lovely and of good report in the human life and world which He has created."

REALISM AND PHOTOGRAPHY.

Countess Cowper inveighs against the "realism of to-day," which she describes as the idea "first to conceive the nastiest subject possible, and then to paint it in the nastiest possible way." "Perhaps," she observes, "one of the greatest enemies to the realism of the present day is the steady growth of photography. After all, what can be more realistic than its manner of working? A flash, and there is the figure in its most natural and real condition. Laughing, crying, winking, jumping, you can fancy you see the movement and almost hear the speech. But does that satisfy the sitter or the artist? If photography has discovered that in order to be real and true it must also be ideal, it is thereby teaching us a lesson which we may do well to profit by."

OTHER ARTICLES.

The Rajah of Bhinga indulges in strong language concerning the encouragement which the British Government holds out to the National Congress seekers after power and subverters of British rule, who foment the cow-riots. He is afraid British faddists may soon make India a penal settlement for Indians, and pleads against the use of British bayonets to compel the submission of the warlike races to the examination-passing, sedition-preaching Hindu coward.

Mr. Reginald Brett continues his delightful sketches of the Queen's relations with her great Ministers. He now describes the change introduced by the influence of her "permanent minister," as the late Prince Consort was called.

Canon Cheyne replies to Dr. Sayce's recent endeavor to discredit the "Higher Criticism" by the results of Oriental archaeology.

THE NEW REVIEW.

IN an article on "Parties in Ireland and the Ministry," Mr. Tim Healy discusses Mr. Morley's administration, which, he says, was inspired by a dual policy, one to make the Home Rule bill the biggest he could, and the other to inspire the Irish Tories with a confidence that no revolutionist had taken up his quarters at Dublin Castle. In both directions Mr. Healy thinks Mr. Morley has succeeded. As to the Home Rule bill, he played a manly and courageous part throughout the whole discussion. In Ireland, however, the putting of new wine into old bottles has not been successfully accomplished. Mr. Healy laments that nearly all the leading Irish officials are Free Masons, and suggests that if the statutory lists of Free Masons annually filed with the Clerks of the Peace of each county had added to them the salaries and allowances and government contracts enjoyed by them the total would lead to the conclusion that they also possessed a monopoly of the intellect of the country. He regrets that Mr. Morley should only have limited the qualification for Poor Law Guardian to \$40 valuation, whereas in England the qualification was \$25, and has since been abolished altogether. He regrets also that Mr. Morley refused to sanction the proposed admission of the Christian Brothers' Schools to the Parliamentary grant, although the whole of the Education Board advocated the change. There is also considerable disappointment at the slender change in the system of appointing sheriffs and the Asylum Boards. The most important and most useful act of Mr. Morley's administration, Mr. Healy thinks, was the prudent and politic step which he adopted of appointing a committee of inquiry into the Land Court.

AUSTRALIAN CRICKET AND CRICKETERS.

Mr. Spofforth traces the development of cricket in Australia. It was in 1862 that H. H. Stephenson visited Australia with his team. At that time almost all the Australian bowlers bowled under-hand. Charles Laurence, one of the most successful of English batsmen, settled in Sydney, and his example did more than anything else to improve the style of Australian batting. He was shortly afterward joined by W. Caffyn, whose forward play was adopted by Victoria, while Laurence's back play was followed in New South Wales. In 1863-64, the second all-England eleven came over, and won ten and drew six out of sixteen matches played. The Australians still bowled under-hand, and put twenty-two into the field against the English eleven. That which made the most impression on Mr. Spofforth was Tarrant's bowling. It was a perfect sight to see him scaring the batsman and smashing the wickets. Round-arm bowling then began to be practiced; but it was not until W. G. Grace's team came over in 1873 that national interest was roused up to an extent which made Australian cricket first-class. Blackham, the wicket-keeper, was the first first-class cricketer Australia ever produced. He was nearly killed by a blow on the chest by a cricket ball, and still bears the mark in the shape of a hollow about the size of a pigeon's egg. Australia won her first match on equal terms at Melbourne, when Bannerman made his innings of 165. After this, in 1878, the Australians came to England. Mr. Spofforth reserves the story of their exploits for another month.

OTHER ARTICLES.

Mr. Archer concludes the translation of Hauptmann's poem "Hannele," Mr. Yates contributes more "Recollections of the Brontës," and M. Fiennes gives some "Notes on Thackery." Janet Achurch and Charles

Charrington explain why they failed in their effort to establish an independent theatre in 1893. There is a short story by Oswald Crawford, entitled "In a Fool's Paradise," the point of which is that the emancipated daughter of a strong-minded woman and a scientist so immersed in his study as not to be able to look after his family are very likely to go to the bad.

Mr. W. Laird Clowes tells the story of the way in which Mr. H. H. Johnston is establishing the Queen's peace on the shores of Lake Nyassa.

THE NATIONAL REVIEW.

THE most signal feature of this month's issue is Mr. George Meredith's poem, "Foresight and Patience." Rev. J. E. C. Welldon's lecture on the art of reading is noticed at length elsewhere. Politics is well to the fore. The position of Liberal Unionists, consequent on Lord Rosebery succeeding Mr. Gladstone, is discussed by Mr. T. W. Russell, Mr. Arnold Forster, Mr. J. Parker Smith and Admiral Maxse; and though their tones differ, all agree that there is no ground for any change of attitude. The Admiral goes so far as to say that if Lord Rosebery had yielded the original ground of discussion "it is difficult, after all the bitter feud, to imagine a reunited 'Liberal party.'" "M.P." deplors with generous courtesy the retirement of Mr. Gladstone, and hopes still to see him back in the House. Mr. St. Loe Strachey replies to last month's critics of his Referendum scheme. Mr. Selous's paper on the Matabele war requires separate mention.

THE BRITISH CIVIL SERVICE.

Discontent in the British Civil Service is voiced by "X. Y.," who gives a sketch of the development of the present system of employment. Prior to 1848, civil servants were appointed in each department, separately, and by patronage. The revolutions of that year, and the mismanagement disclosed during the Crimean war, led to a report by Sir Stafford Northcote and Sir Charles Trevelyan in 1855, recommending the selection of candidates by open competitive literary examination, and the separation of intellectual from mechanical labor. But appointment by patronage flourished with only slight check until 1870, when an order in council established the principle of open competition, and sorted entrants under two "schemes," according to importance of duties. The Playfair Commission in 1874 divided the work in each department into administrative and routine, and entrants into higher and lower divisions accordingly. The grievances circle round the "incompetent senility," which is the survival of the old patronage days, and the scant chances of promotion for ability in the second division. The writer argues that a man's position should not be fixed for life by his entrance examination alone; for exceptional ability subsequently displayed there should be an easier upward path. He demands the instant and compulsory retirement of the idle and incompetent in every grade, and the appointment of a new commission to complete the forty years' transition.

OTHER ARTICLES.

Mrs. Strachey writes, in reply to the "Family Man's" Family Budget of last month, to show how, from a woman's point of view, a family including three children could live comfortably in the West End on \$3,500 a year and leave a margin of \$460. She longs for the "flat" system. "At present the upper middle-class idea of matri-

mony on \$3,500 a year is a ten-roomed house and three maids. What a much better time the harassed housewife would have if she had a neat compact little flat of five rooms, a bath-room and a kitchen, a nurse to look after the children and a good maid to do the rest of the work."

Lord Lilford enters a strong plea against the destruction of British birds now so recklessly carried on.

THE FORTNIGHTLY REVIEW.

THE April number has several first-rate articles, although the level of excellence is by no means equal. Two poems by Paul Verlaine, "Retraite" and "Crainces," confer an unwonted distinction on this English review. Mr. G. Bernard Shaw's rejoinder to Mr. Mallock's attack on the Fabian Society is, quite apart from its economic arguments, a very brilliant piece of wit and irony. It is characteristically entitled "Mr. Mallock's Trumpet Performance." The story of the Italian bank scandals is told with much indignation by Napoleone Colajanni. Mr. W. H. Hudson speculates on the impressions created by the strangeness of the serpent.

A WAY TO UTILIZE WOMAN'S ART.

"Women as Students of Design" are, Mrs. J. E. H. Gordon thinks, at present sadly to seek in this country:

"In one small room we often see congregated and crowded together every possible and impossible decoration. The walls and ceilings are covered with patterns. Patterns crawl over the chintzes and curtains, and the carpets are either mosaics, of imitation Eastern coloring, or else are covered with a sprawling arrangement of leaves and spotty flowers. . . . Now the result of all this is that the eye becomes fatigued, and when a really fine and noble design is placed in such a room it fails to produce its effect because of the undergrowth of futile patterns that already cover every available space of the floors, ceiling, walls and furniture. How much the English might learn from the Japanese in the art of leaving large spaces undecorated, so that the single good design . . . should have proper advantage."

Mrs. Gordon writes in support of the projected School of Design, and hopes that it will combine with artistic instruction technical and industrial skill. "How valuable such a centre of art would be for utilizing the talents now being frittered away on the painting of fourth and fifth rate pictures."

FRANCE'S EMPTY QUIVER.

Count Gleichen reports that the French during their thirteen years in Tunis "have done very well indeed;" they have turned what was a barbarous country into an outwardly flourishing and respectable community. But while Maltese and Italians are rapidly increasing, the French population remains almost stationary. Hence a European war might easily see Tunis in revolt, and, with Italian help, shaking off the French yoke. The jealousy of other great powers prevents France making the use she would like to make of Tunis. But lack of enterprise and lack of population make the fairest colonial schemes of France unfruitful. "What is the use of France trying to extend her empire throughout the world by means of colonies when she has got barely enough children with which to populate the mother country? . . . Each new colony, instead of being an acquisition to France, means so much more out of her pocket, so many more miles of frontier to defend, and so many more square miles of anxiety and trouble."

THE NEW IRELAND REVIEW.

THE regeneration of Ireland, of which the impending triumph of Home Rule forms the political expression, is preparing for itself less contentious and perhaps more quietly constructive modes of development. Among these may be reckoned the growth of a national periodical press and the deepened self-consciousness of a national literature. An illustration of the tendency is furnished by the appearance of a sixpenny monthly entitled the *New Ireland Review*, and published at 54 Eccles street, Dublin, the first number of which came out in March. The editor's inaugural words are full of the hope of the new era. The term "New Ireland" used of their country in 1870 they declare to be more decisively applicable to the Ireland of to-day. They refer in proof to the change in the status of the Irish farmer, who is no longer a dependent but virtually or actually owner of the soil; to the political enfranchisement and social advance of the Irish laborer and artisan, and to the fully developed system of intermediate education, and to the rudiments of a university system for Ireland.

There is conspicuous absence of reference to Home Rule. The reason for this omission may perhaps be found in the assurance that the contributors secured consist of "thinkers and scholars of all schools of opinion." Difference of opinion will be kept within the limits imposed by "a rigorous respect for the religious faith" of Irishmen. The political article, which is by Mr. Tim Healy, and deals with the procedure of Parliament, is noticed elsewhere. In a dialogue on the "Limitations of Irish Poetry," Mr. William Magennis urges that "the elements of Irish nationality are growing confluent in our minds, the Celtic, Saxon and Norman elements, fused and blended in the living race," and that while "a truly representative literature should contain and exhibit in combination the characteristics of all," "the Gael, the Irish Celt, has absorbed the Saxon, just as the Celt of Gaul absorbed the Teuton, and, in the north, absorbed the Scandinavian to make the Norman, so that as the Gael predominates in the composition, it is not too incorrect in us after all to style ourselves Gaels." Mr. George Sigeron, M.D., triumphantly proves from the fact of evolution and from Haeckel's qualified confirmation of Genesis, that Moses, so far to anticipate the evolution of science, must have received a revelation. Rev. T. Finlay's "In Memory of Ned Long," is a vivid portraiture of the life of an Irish peasant in the poorest districts. In Rev. William Barry's romance of "The Ford of the Dead" we have the weird pathos and the racy dialect of the Irish folk-story-teller. The traditional interest of the Irish in French affairs is represented by Sir Rowland Blennerhassett's "Failure of Constitutional Monarchy in France." The flavor is throughout Irish and Catholic.

THE LONDON QUARTERLY REVIEW.

THE *London Quarterly Review* for April falls considerably below the average. The late Dean Stanley is described in a review of his life as "essentially a humanist," and silent or vaguely discursive on the deepest problems of human life. "Broad Churchism as a theory is dead, if indeed it ever lived." The biography of the late W. H. Smith is supplemented with a fuller account of his transition from Methodism. Early Methodist influences saved him from the Calvinism of the Low Church or the ritualism of the High Church. Dr. Sanday's Bampton lectures on inspiration are pronounced to be not satisfactory: "the theological or philosophical discussion which Dr. Sanday does not touch will have to be

undertaken." The eternal social problem appears in a criticism of Morris and Bax, Mann and Webb, and in a dubious estimate of Mr. Mallock's discovery of the progress of the working classes to social happiness without revolutionary help. The article on Alice Earle's "Old and New England" is the most interesting item in the bill of fare.

SCRIBNER'S.

WE have reviewed in another department Mr. H. C. Bonner's paper "The Bowery and Bohemia," and Gustave Kobbé's account of "Life Under Water."

In Octave Thanet's "The Farmer in the South," she draws a perfect picture of the so-called "successful" negro farmer of to-day, which is such a perfect hit-off of this type that a paragraph is quite worth quoting. "Behind his chair stood a black man, the image of a black Arkansas farmer. This farmer is he who owned the range like Madison Monroe's. His wife has a sewing machine and an illustrated history of the Bible. He himself has a stout spring wagon for holidays, as well as a good farm wagon. He has horses and cattle and swine; and besides his rented land he owns a farm without a mortgage. He may be considered a successful negro. Yet the number of times that the neighboring planter, who gins his cotton and is, in consequence, his guide and protector, has rescued him from the financial pit, is beyond counting. He was saved from a typewriter agent last spring (he can neither read nor write, but the agent persuaded him that these arts could be acquired almost without effort on his machine), and only the fortunate circumstance that he cannot even print his name, prevented him affixing it to a recommendation of school charts which came back in the startling shape of promissory notes to various signers. Half a dozen times would Uncle Jim have gone on the notes of utterly worthless vagabonds, for old acquaintance sake, had he not been forcibly restrained and saved. From each escape he has gone away sorrowful, the good-natured man. Such negroes as Jim need a guardian, and they are not the ones of their race that need it most."

Arsene Alexandre has a good subject in "French Caricature of To-day." The best art in this department he thinks is confined to a few masters in France, and he considers that the average of French caricature is much below that of the English or German. The French imitator of his neighbors "almost never succeeds in catching the least particle of their wit." This is rather curious in the nation which has the name above all others for a *belle esprit*. "It is easy to point out what is the characteristic of German caricature, for example, or of English caricature. Among the Germans it is a peculiar inventiveness, a turn of wit at the same time ingenious and grotesque, unexpected and full of straightforwardness. The laugh it excites is hearty and broad. There is not much depth of observation in it, but it grasps in an instant whatever in a situation or in an individual can furnish the material for a transformation or an accident. In German caricature you will constantly find ideas which are in themselves absolutely absurd, but which are perfect discoveries of drollery, such as would only be expected from a dreamy and patient race. For things like this, Wilhelm Busch and Oberländer are minds absolutely without a rival. English caricature (and by this I mean especially that of the last century) is equally easy to define, with its masters like Hogarth, Rawlinson and Gillray. Here there is great spirit in execution, largeness of design, an imagination almost startling, and the very *outrance* of the sentiment of burlesque."

THE COSMOPOLITAN.

THE indefatigable editor of the *Cosmopolitan*, Mr. John Brisben Walker, has in his April number a most remarkable find—no less than a romantic story by Napoleon Bonaparte! This story is from an unpublished manuscript confided by Napoleon to his uncle, Cardinal Fesch, and its authenticity is vouched for by no less an authority than Frédéric Masson, who tells the history of the remarkable document. Intrinsically considered the tale of the fortunes of the manuscript are as interesting as the romance itself, which is unfinished, and which is full of murder and sudden death. These papers were intrusted by the Emperor to his uncle, Cardinal Fesch, they being in a pasteboard box, covered with gray checked paper, and sealed with the Napoleonic arms. The trustee died in Rome in 1839, when the box came into "the hands of his Grand Vicar, Abbé Lyonnet, who in 1841 published a defense of the Cardinal, accompanied by very curious documents. The box had not yet been unsealed when Prince Charles Bonaparte, a son of Lucien, passed through Lyons. The Grand Vicar profited by this visit to have it opened in the presence of the prince, but the latter, wholly taken up with his studies in American ornithology, took no special interest in the youthful productions of his uncle, and left them in Lyonnet's hands. Some time later a famous bibliophile visited Lyons, one who could better appreciate their value. It was the notorious Libri, member of the Academy of Sciences. Guizot had appointed him general inspector of French libraries. Under the pretext of inspecting he never failed to put aside for his own benefit the rarest manuscripts, most costly books, the autographs whose market value he knew would reach the highest point. Then he would change the binding, erase the stamp marks, falsify descriptions and sell them at public auctions.

Libri bought the Bonaparte papers and sold them to the eager English book collector, Lord Ashburnham. And so on the adventurous documents passed from owner to owner and were finally deposited in the Royal Library of Florence.

Mr. Edward W. Bok gives some further words of advice to "The Employer and the Young Man," and takes a very true and shrewd view of the mutual relations of employer and employed. He complains that especially in subordinate positions, the clerks of some great business houses are not taught to be honest.

"The fact of the matter is, to put the truth plainly, too many employers ask their employees to be nothing more nor less than liars. Scores of young men daily fight the battle between an adherence to the principles of the home and those they are asked to represent in business. As an office boy, I had the most perfect training possible to become an accomplished liar. I was told, at least half a dozen times a day, to say to callers that my chief was out when he was in. At home, I was taught that truthfulness and honesty were the current coins in business. And yet, day after day, I was shown the falsity of it by my employer. I refused to lie for myself, and yet I was compelled to lie for another. When I became a copyist, it was asked of me to write letters which I knew to be absolutely contrary to existing facts. And yet I was in the employ of one of the largest corporations in the world, and one of honorable repute. My direct chief was a man esteemed alike in business and social circles. He was, too, a recognized pillar in the church."

This article is one that ought to create wide discussion and that may well lead to an improvement in the minor morals of many business establishments.

THE CENTURY.

AMONG the "Leading Articles" we quote from William Henry Bishop's account of "Hunting an Abandoned Farm in Connecticut."

Mr. Marion Crawford, in giving an inventory and exegesis of the "Gods of India," incidentally breaks one of the literary idols that our universities and comparative historians have for a long time taught us to worship. The Vedic religion and its hymns are scarcely, he says, characterized by the grand simplicity and primeval single-heartedness with which they have been credited. "Grand those hymns are beyond a doubt and they breathe a high belief in a single Supreme God though abounding with allegory and simile taken from the manifestations of nature's forces, but simple they cannot be called nor does it seem possible that they can have been called in any true sense primitive. The language is complex and the imagery often highly artificial, while meters of great variety are kept perfectly distinct and never confused. It was in every sense an intricate religion, and it is more than probable that it was never the religion of the people."

George E. Waring, Jr., under the euphemistic title "Out of Sight, Out of Mind," goes over the latest investigation in the matters of sewage disposal. He finds that the irrigation or filtration method is by far the best one, that it can be made to fit almost all kinds of soil or surface conformations and that it is equally available for a single house or a village or a town, while "its processes are so nearly automatic that its use on a small scale requires no care and maintenance. The scientists have fully established the fact that house drainage is odorless when first produced and does not become offensive unless retained for a day or two. And that if it is applied when fresh to the surface of suitable ground its water is removed in a condition fit even for safe drinking and its impurities are completely destroyed both in winter and summer without offense or danger of any kind."

HARPER'S.

MR. GEORGE W. SMALLEY is reactionary in his article on the "English Senate." He analyzes the various phases of opposition to the House of Lords, finds much of it illogical and considers a great deal of the American condemnation of it as very ignorant. The following paragraph will suggest Mr. Smalley's attitude:

"Fully agreeing that the House of Lords must be reformed if it is to endure, I nevertheless think that the majority of Englishmen who act from other than party motives, or impulse, or mere doctrinairism, will resist the abolition of it, at least until some rational and workable scheme for another Second Chamber shall have been proposed. For it is their one bulwark against an untamed, untaught, inexperienced, incapable Democracy. If that expression shock any thinking American, I will ask him whether there are no limits to his belief in Democracy as a political panacea. He knows that in America Democracy has a bit in its mouth. He knows that in England it has none. Does he think all men fit to be trusted with self-government?"

In the "Editor's Study," Mr. Charles Dudley Warner comments upon the duty of a newspaper toward crime and specifically of the reporter toward the detection of crime. Mr. Warner finds chapter and verse in Ezekiel for the first historical mention of the reporter and makes him already at that early period mingling detective functions with his "literary" duties.

"This has gone so far that the chief ambition of many reporters is to shine as detectives, and their belief is that

their reputation in this work will increase their value to the newspapers they serve. This ambition is natural under the recent notion of the newspaper that it is in charge of the affairs of the universe in general; that it must instruct the statesman how to govern, the general how to fight, the minister how to preach, the courts how to try cases, the schools how to educate pupils, the scientist how to investigate, the player how to act. If it is the business of the newspaper to detect the criminal, collect evidence against him, and try him, and judge him before the courts get a chance at him, then naturally the reporter becomes a detective, a sifter of evidence and a jury. The editor is just simply an ordinary Rhadamanthus."

M'CLURE'S.

ETHEL C. McKENNA writes about the very attractive personality and daily life of Ellen Terry. She credits the famous actress with an infinite capacity for detail, finds her entirely unspoiled by success and tells of striking instances of her indomitable will as called forth by the demands of her profession at times when she was in no physical condition to appear on the stage. Miss Terry is very unlike the cult which comes to the "profession" after a more or less brilliant social career and as a *dernier resort*. For her father and mother were both on the stage, and she has been there almost since she can remember. She is a good housekeeper and lives quietly at her two homes, one at Barkston Gardens and the other at Winchelsea.

Mr. E. C. Coates of the Indian Museum at Calcutta tells some uncanny but entertaining facts about "The Poisonous Snakes of India." The giant among the many venomous reptiles which that country boasts is the hamadrya, which grows to be fourteen feet long. Between the various species they manage to kill twenty thousand people a year in India. These are almost exclusively natives, for people with boots are not apt to get bitten. The native is not only more exposed in his bare feet, but he also makes scarcely any sound as he walks along, and frequently surprises and angers a snake in the path. Notwithstanding these horrible figures of mortality, the natives will not co-operate with the authorities in destroying their enemies, but regard them with a superstitious reverence and will not even be tempted by a reward to kill a snake willingly. They even encourage the creatures to come about their house. As to the snake charmers, Mr. Coates says, they do not, as is ordinarily supposed, always remove the poison fangs, and even if they do, snakes are not necessarily rendered innocuous, since the glands continue to pour out their secretion into the creature's mouth. The only animal that seems safe from the cobra and its kind is the little gray-colored, weasel-like mongoose, which is too quick for the reptiles and invariably kills even the fiercest cobra.

THE SOUTHERN MAGAZINE.

THE South has gained a very creditable representative, in the field of monthly periodicals, in the *Southern Magazine*, which is a handsomely illustrated and well-edited popular magazine quite able to compare without disparagement with the great monthly journals of the metropolis. The April number is largely given over to fiction and lighter subjects. Richard Deverens Doyle makes a pleasant essay of his impressions of the law and lawyers. Of the barrister's relations to his client he says:

"A bad client is an edge tool and requires careful handling. A lawyer may do much to foment litigation and

much to prevent it. He may be harsh and cruel in his dealings, or kind and peace-loving. Everything depends on the man. The method of paying lawyers by fees has its temptations and inherent difficulties as well, and the collection of reasonable compensation sometimes does violence to the finer feelings of our nature. It has its temptations and difficulties because of the impossibility of accurately determining the value of scientific skill, mental labor and responsibility. The lawyer who entered as one of the items of his bill

To lying awake at nights and thinking of your case...£50 was charging for a very indefinite but, perhaps, very valuable service. This imponderability of legal service is a temptation, not always resisted, to charge exorbitantly. As a rule, however, lawyers are not adequately paid, and do not in a lifetime accumulate as much as their knowledge, talent and labors should earn, nor as much as they would command if employed in some other vocation."

THE ATLANTIC.

IN another department we have quoted from Joseph L. Brent's paper on "War's Use of the Engines of Peace."

Such a careful critic of war history as Eben G. Scott, in discussing "General Lee at the Campaign of the Seven Days," blames the Southern commander severely in his tactical arrangement of his forces, especially in the battle of Malvern Hill. He thinks that it is a "striking illustration of General Lee's shortcomings as a tactician; it does not present a single redeeming feature to the failure of the Confederates. The outcome of this battle was a complete defeat for them, and not a creditable one at that. Everything upon their side was chaotic: there was no concert, no unity, no leadership. Their conduct was that of blind and senseless giants striking out they knew not whither, and hitting at random. A mass of men would rush up a deadly slope, yelling as if there were a Jericho before them to fall by mere sound; another, at a distance and acting independently, would be doing the same thing; both would be sent back torn to pieces."

But while Lee is criticised severely on this side, this writer considers that he redeems himself in his genius for audacity. Still referring to the campaign of the Seven Days, Mr. Scott says: "In deserting his fortifications and courting the chances in the open field General Lee exhibited this high quality of audacity in greater measure than any general has done during the latter half of the present century."

"The Referendum in Switzerland and in America" is the subject of a paper by A. Lawrence Lowell. He concludes his statement of the pros and cons of the Referendum as an American institution as follows:

"To sum up what has been said, we find that the Referendum in America is applied only to constitutional questions, and to a small number of other matters which are carefully specified. We find also that, except in the anomalous case of the bank acts in a few States, these matters are akin to constitutional subjects, and are of such a nature that the question submitted to the people is extremely simple. It will, moreover, be observed that the submission to popular vote is always compulsory. Now, these results have an important practical bearing; for if a further extension of the Referendum in America is desirable, it is at least probable that the wisest policy will be to follow the lines on which the institution has spontaneously developed. By such a course alone can dangerous experiments be avoided, and the harmony of our system be insured."

THE FRENCH REVIEWS.

LA REVUE DE PARIS.

IN both the March numbers of this new review its first high standard of excellence is fully maintained. Apart from M. Gabriel Monod's account of Taine, the historian, and Octave Feuillet's letters from Compiègne and Fontainebleau, perhaps the most generally interesting article in the March 1 number is that dealing with the "Feudal Prussia of To-day," by M. Godefroy Cavaignac, the *Député* who is said to have a good chance of succeeding Carnot in the French Presidency. According to this writer, who is also, by the way, represented by an article in the *Revue des Deux Mondes*, the whole of Eastern Prussia is still governed by a modification of the feudal system. Even as late as 1872 the possession of an estate gave the German landed gentry almost sovereign rights over the villages and their inhabitants. The lord of the manor had entire control of the municipal moneys and of the rural police; he was also general lawgiver. Many of these territorial rights were abolished by a law passed twenty-two years ago, but there still exist thousands of estates, according to M. Cavaignac, where the German country gentleman is petty king. His subjects, however, seem to have little reason to complain of this state of things, for if a new road has to be made, a new school built, or a fresh set of public buildings to be erected, it is the lord of the manor who is expected to pay for it all. In return he arrogates to himself the right of choosing the schoolmaster, and as often as not the municipal officers of the parish. Those who wish to change what is should remember, according to their French critic, that Prince Bismarck was and is the absolute outcome of feudal Prussia.

M. Masson, who has of late become an authority on all that concerns Napoleon the First's private life, gives in an article on the Imperial court, an amusing account of how *le petit caporal* understood etiquette. He makes out that Napoleon Bonaparte modeled his regal state on that of Charlemagne, the very cloak he wore at his coronation having been copied from one of the oldest portraits of his legendary predecessor. Every office in his court had its counterpart in that of Charlemagne, and at one time he even seriously considered the advisability of creating a new or rather a revived nobiliary order of Margraves. And thus it came to pass that the court of Napoleon the First and of the Empress Josephine was a strange amalgam of mediæval and modern etiquette. Napoleon had no fear of ridicule. M. Masson quotes him as having once exclaimed, "Power is never absurd," and perhaps nothing in the social history of the world has been more strange and significant than the way in which Bonaparte's soldiers adapted themselves to their positions when their leader created them in turn kings, marshals, or barons, as the fancy seized him.

Another installment of Balzac's letters to Madame Hanska is, if possible, even more interesting than its predecessors, and those who are apt to believe in the fickleness of the French character should study this series of love letters, which, lasting over twenty years, only came to an end when the great novelist married his fair correspondent.

In the second March number of the *Revue de Paris* an anonymous writer reviews the position of the Legitimist party during the last twenty-two years. In it the author, an old friend of the Comte de Chambord, and apparently one of the most trusted advisers of the Comte de Paris,

severely criticises the attitude taken of late by the Vatican toward the French Republic. He declares that, though a good Catholic, neither he nor his friends recognize the Sovereign Pontiff's right to interfere in temporal matters. Further, he entirely denies that any real reconciliation has taken place between the French Church and State. Though the whole article is written in a cautious and judicious spirit, it is evident that "X. X. X." considers that the Legitimists have reason to hope for a not distant re-establishment of the French Monarchy.

Alexandre Dumas *fils* publishes a preface to the collection of plays written by him in partial collaboration with other playwrights. He denies ever having really worked with anybody. When asked to become part author of a comedy, his invariable rule was to only accept the proposition if he was allowed an absolutely free hand, and on no occasion did he ever sign his name to anything not wholly written by himself. Still, he admits that he has owed much in the way of plots and suggestions to those with whom he has thus indirectly collaborated.

Miss Mary Robinson, who with her gifted sister, Madame Darmsteter, makes a specialty of mediæval France and old French literature, writes a charming account of Froissart's visit to the Comte de Foix, "Gaston Phebus," one of those strange, half-legendary figures whose names are still household words among the French peasantry.

M. Dufeulle contributes a short biography of Provost Paradol, the friend of Taine, and a well-known French historian and journalist. J. Bourdeau attempts to explain the causes of revolutionary anarchism, and includes in his article a friendly little biography of Prince Krapotkine, to whom he, however, ascribes much of the anarchy of to-day.

THE REVUE DES DEUX MONDES.

THE *Revue des Deux Mondes* for March 1 contains an article by one of the most solid writers in France, the Comte d'Haussonville, a descendant of the famous Madame de Staël. "L'Assistance par le Travail" is best translated by the phrase "Public Works," if this be used in detail and not applied solely to roads and bridges, and the paper opens with: "Must charity be exercised?"—a question which would certainly have sounded strange forty years ago, for in those days charity was spelt with a capital C; statues were raised, and odes sung in her honor. Now all is changed. Charity has ceased to please. She is seldom spoken of, except in the way of blame. And this, points out the writer, by three different sets of people. First come the believers in the "audacious hypothesis of Darwin upon the transformation and progress of the species by competition, and the survival of the fittest." These think that on the whole the feeble and unsuccessful folk had better be wiped off the face of the earth. Their master has spoken: the master in this case is Herbert Spencer, the inventor of the doctrine, whose influence upon youth has for twenty years been so great, not only in England, but in France. Certainly this good logician, if pushed to it, would let the corpses of the victims of a great public calamity, such as the Lancashire famine, "lie about the roads," rather than injure the reserve in the banks. The second group includes the various sections of Socialists who deprecate charity because they desire and require a complete reorganization of

modern life. The third group consists of "a certain number of adversaries to charitable assistance; and though the most unexpected people are to be found among them, they are perhaps for that reason the most to be feared." M. d'Haussonville has some new and interesting things to say as to the spread of Socialist theories among the young priesthood of the Catholic Church, based upon their interpretation of the Pope's encyclical; yet he does not at all approve of the diffusion all over the French provinces of halfpenny papers, in which Christ is held up as the Working Man.

In the second number of the *Revue des Deux Mondes* the first place is given to an article dealing with the god of mammon, and written by M. Leroy Beaulieu. He attributes the present supremacy of wealth to two main causes—the one spiritual, the other political, the first being the gradual loosening of the bonds of Christianity, the second the sudden growth of Democracy. In past days, declares the writer, "Faith fought a hard fight with Mammon. '*Militia vita hominis super terram*,' said the Apostle, and the old world Christian did not expect to be paid for his services. But latter day man's conception of life has entirely changed; people now only live to enjoy themselves and get all they can out of existence. Wealth can buy almost every satisfaction." In his next paper M. Leroy Beaulieu will deal with Wealth and Democracy.

M. Hervé reviews Gustave Fagniez's life of Père Joseph, Richelieu's *alter ego*, and a man nick-named "His Gray Eminence" by his contemporaries. This Capuchin monk exercised an immense influence on the France, and indeed on the Europe, of the seventeenth century, partly owing to his extreme intimacy with Richelieu, and to his own marvelous activity. He founded several religious orders, the most important being that of the Calvairiennes, of which Antoinette d'Orleans was the first Abbess. It is from the present feminine heads of the order that Père Joseph's biographer has been able to procure many valuable documents. For fourteen years this singular man and the famous statesman worked side by side, the Capuchin friar being, as it were, under-study to the Cardinal. He, it is said, was mainly responsible for creating the state of things found by Louis the Fourteenth, and some of his political schemes and achievements bear fruit to this day.

In a curious account of political parties in contemporary Holland, M. Benoist describes Doctor Schaepman, the chief of the Dutch Democrats as being "the first of the poets, the leading orator and perhaps the greatest statesman of latter-day Holland." Dr. Schaepman is a Catholic priest, and is, among other things, a professor at the Rijsenburg Seminary. Till he became a pioneer his co-religionists hardly counted; he has made of them a factor in the State. His motto is *Credo Pugno*, "I believe, I combat," and he somewhat scandalized the more narrow-minded of his followers by hailing as comrade Dr. Kuyper, a Conservative Calvinist, who has been before now styled in the Netherlands the Protestant Pope. Dr. Schaepman does not often speak in the Dutch Parliament, and when he rises his words are few, but he is a great orator for all that.

M. Fere describes the late Dr. Charcot's life and work, insisting with considerable justice on the importance of the great discoveries concerning nervous diseases and their causes made by the famous neurologist. He was a firm believer in eyegate. For instance, when giving a demonstration lecture on nervous movements of tremblings, he would cause to be stuck into his patients' head-dresses a number of feathers, and this, though it began by exciting the risibility of the students, resulted in proving to them what the lecturer wished to indicate

concerning nervous movements. Charcot was also one of the first to make use of a magic-lantern in demonstration classes. His biographer has touched but lightly upon the famous doctor's investigations into the mysteries of hypnotism, but he observes significantly that, as far as he knows, Charcot never made use of his discoveries in ordinary practice; all his experiments took place in the Salpêtrière Hospital.

THE NOUVELLE REVUE.

M. FLOURENS concludes his study on Napoleon I and the Jesuits, and points out that, notwithstanding the many laws promulgated against the famous Society of Jesus, the order has always defeated the machinations of its enemies. M. Flourens therefore concludes that as no decrees can be enforced, it would perhaps be better to rescind the order of expulsion, evidently considering that it is better to meet an enemy in the open than in a hidden place. These articles are chiefly interesting as showing once more the intense fear felt by a certain class of intelligent Frenchmen to the militant order founded by Ignatius Loyola, as well as their hatred of the society.

M. Engerand continues his account of mediæval watering places, and of the way in which our ancestors amused themselves. Then, as now, the local physician was a most important personage, and in 1665, during the very year in which Molière produced his "*L'Amour Médecin*," a visitor to a French curé was condemned to pay 100 francs fine and interdicted from the use of the waters during six months for having called the physician "that ass of a doctor!" Mme. de Sévigné wrote some of her most characteristic letters from Vichy, and it is through them we learn that her doctor united to his other functions that of being reader and general entertainer to his fair clients, and this while they were actually being bathed and treated.

M. Faisant, in an article on "The Present State of Agricultural and Social Depression in Sicily," warns the Italian Government that if something is not done—and done soon—toward the amelioration of the condition of the working classes, there will be a Socialist rising.

In both numbers of the *Nouvelle Revue* Mme. Vera Veced tells the story of Admiral Nevel Koy, the Russian explorer, up to the time of his marriage to Catherine Eltchanimoff, of Irkoutsk, the young girl who shared all his later perils and glories.

M. Zeller attempts to prove that the Anabaptists who flourished during the commencement of the Reformation may claim to have been among the first Socialists Europe has known; but he points out that Luther, so far from taking the view that religious and political liberty are one, threw all his influence on the side of law and order, and this at a considerable personal peril to himself.

The naval officer whose gloomy exposition of "France's Maritime Peril" has attracted a certain attention on the Continent, contributes another article on the same subject to the second March number of the *Nouvelle Revue*.

He surveys exhaustively the existing naval defenses on both the northern and southern coasts, giving special prominence to Calais and Guiberon on the one side, and to Corsica on the other. The writer declares that no time should be lost in organizing a maritime mobilization in and round Ajaccio, and he points out the advisability of treating the whole island as a center of French naval and military operations.

Lovers of Dante will find in the same number an interesting study on his "*Paradiso*" by M. Durand-Fardel.

THE NEW BOOKS.

RECENT AMERICAN PUBLICATIONS.

HISTORY, ECONOMICS AND SOCIAL SCIENCE.

A History of the Mental Growth of Mankind in Ancient Times. By J. S. Hittell. Four vols., 12mo. New York: Henry Holt & Co. \$6.

Mr. Hittell's work is an extensive and carefully arranged accumulation of facts rather than a critical or philosophical review. Here and there, though rarely, he has adopted a somewhat dogmatic tone which impresses one as unnecessary in a historical work of this nature. Mr. Hittell believes "that continuous progress has prevailed throughout the past; and that the irrepressible progressiveness of humanity is one of the great facts or laws of nature." The advance of culture he distinguishes into the stages: Savagism, barbarism and civilization. Volume I treats of "Savagism," of its industry, social life, intellectual life, polity, military system and religion. In Volume II under the general title "Heathen Barbarism" the author details the state of civilization among the Aztecs, the Guichuans, the Chinese, the ancient Egyptians, the Hindoos, etc. Volume III is devoted entirely to "Judea and Greece;" Volume IV to "Rome and Early Christianity." Each volume contains an appendix, including, with other matter, a bibliography which shows that Mr. Hittell has gleaned his knowledge from a wide and creditable reading. The value of this history as a store-house of authoritative information and as a reference work touching the early conditions of industry, social and civil custom, ethics and religious beliefs, etc., etc., make it worthy of careful investigation by the student. Mr. Hittell's style is clear and crisp; his sentences are as a rule short, embodying some single fact or generalization. The publishers have issued the work in a neat and convenient form for library service.

History of the Jews. By Professor H. Graetz. Vol. III. Octavo, pp. 683. Philadelphia: Jewish Publication Society of America. \$3.

The earlier volumes of this scholarly and readable translation have had prominent commendation from the press. Volume III covers the period "from the revolt against the Zendik (511 A.D.) to the capture of St. Jean D'Acre by the Mahometans (1291 A.D.)." It is a marvelously clear, detailed and yet well-proportioned record of the scattering of the Jewish people throughout Europe, of the persecutions they suffered, of the religious and philosophic leaders who from time to time arose in their ranks, of their relations to the Empire, to various monarchies, to the Crusades, to science and scholarship. Professor Graetz's style has the simplicity of a chronicle of events; the reader feels himself in the presence of one who has a masterly grasp of the subject, who compels us to forsake traditional ideas and face the facts and an unprejudiced interpretation of them.

Slav and Moslem: Historical Sketches. By J. Milliken Napier Brodhead. Octavo, pp. 309. Aiken, S. C.: Aiken Publishing Company.

Under the title, "Slav and Moslem," the author discusses Russia's origin and civilization, Tartar domination, serfdom, the Romanoffs and the revolutionary movement, Russia in Asia, the Afghan question, Turco-Russian wars, Alexander III and consolidation, and other topics related to his theme.

The Vermont Settlers and the New York Land Speculators. By R. C. Benton. 12mo, pp. 188. Minneapolis, Minn.: Published by the Author.

This work deals with what is commonly known as the "New Hampshire grants" controversy, an episode in American history which antedated the Revolution and which ended only with the admission of Vermont to the Union. Col. Benton's discussion of the legal aspects of the question is especially thorough and comprehensive.

If Christ Came to Chicago! A Plea for the Union of all who Love in the Service of all who Suffer. By William T. Stead. 12mo, pp. 472. Chicago: Laird & Lee. \$1; paper, 50 cents.

American readers have been fully apprised through the newspapers of Mr. W. T. Stead's first visit to the United

States and of his sojourn for several months at Chicago, where he became deeply interested in the moral aspects of local social and political problems and made many public addresses. Mr. Stead has revised and recast the substance of those speeches in a book bearing the title listed above. It is an attempt to arouse the best forces and elements of a great urban population to union and to definite action for the cleansing of municipal politics and the bettering of the environment of the unfortunate classes. It is evident that the book, while specifically devoted to Chicago's social conditions, is intended to hold up the mirror to all great modern aggregations of population. Few of the gross evils and social inequalities which Mr. Stead's bold pen describes are half so obvious or so deep-seated in Chicago as, for example, in London. Probably no one would more readily assent to this proposition than Mr. Stead, and it may perhaps be asserted with truth that it was his immense ardor and enthusiasm for Chicago, and his perception of its magnificent possibilities in other than commercial aspects, that led him to the painting of this portrait which at first sight appears so horrid and repelling. Mr. Stead supremely desires to promote the union, for practical purposes of social, moral and political reform, of all the groups and classes, religious denominations and population elements that may fairly be said to possess any degree of true public spirit, any real solicitude for the suffering and unfortunate, and any noble aspirations for a better state of life and society. Evidently he has a high conception of the ideal modern municipality. Some cities approach the realization of his conception at one point, and some approach it at another. Mr. Stead wants to see Chicago, London, and every other great English-speaking centre, moving with all the united energy of its best citizens toward the realizing of this high conception at all rather than at some points.

Social Reform and the Church. By John R. Commons. 16mo, pp. 186. New York: Thomas Y. Crowell & Co. 75 cents.

Professor Commons has become known to the reading public through his contributions to the periodical literature of the day, and particularly through his work on "The Distribution of Wealth," which appeared only a few months ago and which, in the opinion of Professor Ely, "is destined to exercise a decided influence upon the development of economic thought." The present volume consists of seven essays, six of which were read originally before audiences distinctively Christian. The titles are: "The Christian Minister and Sociology;" "The Church and the Problem of Poverty;" "The Educated Man in Politics;" "The Church and Political Reforms;" "Temperance Reform;" "Municipal Monopolies;" "Proportional Representation." The last mentioned was read at the World's Congress on Suffrage and is intended as supplementary to the essay on "The Church and Political Reforms." The point of view of the author is that of the church member who recognizes the duty of the church to "develop all that is highest in every son of man." The divisions under which Professor Commons treats the great questions of the Church as to political reforms, are: What part have politics in the salvation of the world? Why do politics fail in their mission? How can they be made the instruments of social reform? and, What should be the attitude of the Church toward politics? He shows how their treatment should be scientific and fundamental, and not sentimental and empirical.

The Natural Law of Money. By William Brough. 12mo, pp. 173. New York: G. P. Putnam's Sons. \$1.

The author of this volume of essays on the monetary question writes with the aim of showing that money should be freed as much as possible from governmental restrictions. Each section of the country, in his view, should be permitted to use the money it prefers. His argument is interesting, though it is probable that neither monometallists nor bimetalists generally would accept his premises.

A History of Political Economy. By Dr. Gustav Cohn. Paper, 8vo, pp. 142. Philadelphia: American Academy of Political and Social Life.

American students are indebted to the American Academy of Political and Social Science for a translation of several chapters on the history of economic science by the great Ger-

man scholar, Gustav Cohn. Professor James is undoubtedly right in asserting that this publication presents the German point of view as no other work in English does at present, and in that lies its chief value.

The Statesman's Year-Book, 1894. Edited by J. Scott Keltie. Thirty-first Year. 12mo, pp. 1185. \$3.

This work is now recognized as by all odds the most complete of the statistical annuals now published in English. In the present edition a special effort has been made to revise the data relating to the navies of the world. Valuable tables are presented showing the strength at the present moment of all the naval powers, great and small. Macmillan & Co. are the New York publishers of the Year Book.

The Show at Washington. By Louis Arthur Coolidge and James Burton Reynolds. Paper, 16mo, pp. 241. Washington: Washington Publishing Company.

This is a bundle of clever sketches of Washington personalities by two newspaper correspondents. The writers profess charity for all and malice toward none as their ruling motive in the work, and disclaim any intention to exaggerate the truth in their descriptions of life at the nation's capital.

Life and Later Speeches of Chauncey M. Depew. 12mo, pp. 533. New York: Cassell Publishing Company. \$2.50.

The introductory sketch of Dr. Depew in this volume was written by Mr. Joseph B. Gilder, and though brief is both interesting and authentic. Many speeches are included in the compilation which had not previously appeared in any permanent form; but the selection was admirably made, and the book as a whole is most attractive.

RELIGION, BIBLICAL CRITICISM AND CHURCH HISTORY.

Is Moses Scientific? By Rev. P. E. Kipp. 12mo, pp. 239. New York: Fleming H. Revell Co. \$1.25.

Mr. Kipp, like all wide-awake men, recognizes the fact that religious thought is in something of a revolutionary state at present. He has written his book with the purpose of helping to solve some of the current difficulties of faith. He has confined his investigation to the first chapter of Genesis, for "here positive science comes to the front; here she stands on rock and speaks of what she knows. If there be a conflict here it will not be conducted with missiles of mist, but with the cold steel of well tempered facts." The author confesses that he entered upon the task of comparing the Pentateuchal record of Creation with the position of modern scientific knowledge with some trepidation, "but the increasing delight and astonishment as the points of difference disappeared . . . cannot be told." For those interested in his line of argument, Mr. Kipp's pages are eminently readable, though they will scarcely convince all.

The Triple Tradition of the Exodus. By Benjamin Wisner Bacon, M.A., D.D. Octavo, pp. 432. Hartford, Conn.: Student Publishing Company. \$2.50.

The appearance some time ago of Doctor Bacon's "Genesis of Genesis" called forth commendation from the press and from eminent scholars. Those who are interested in the current critical discussions of the sources and authorship of the early books of the Old Testament will find "The Triple Tradition of the Exodus" an extension of the former work, continuing the analysis to the end of the Pentateuch. Doctor Bacon does not here concern himself with the Jewish legal apparatus, but simply with the "story of Israel from the death of Joseph to the death of Moses." His volume is a credit to American scholarship in a field where laborious research is required before a worthy result is reached and is an excellent example of modern scientific methods in Biblical criticism.

The Divine Armory of Holy Scripture. By Rev. Kenelm Vaughan. 16mo, pp. 956. New York: The Catholic Book Exchange. \$2.

This compilation, the result of many years' study and meditation of Biblical lore, commends itself to the Catholic clergy and laity as an important and elaborate piece of work. Cardinal Gibbons, who contributes the preface, predicts for the book "the honest appreciation of all lovers of the Sacred Text." Father Vaughan has arranged Scriptural selections according to the subject matter in such manner as to expound and enforce the cardinal doctrines and the liturgy of the Catholic Church. Among the titles of the several "Parts" are "The Most Blessed Trinity," "Of Mary, the Virgin-Mother," "Life of Saint Joseph," "External and Internal

Law," "Actual and Habitual Grace," "The Holy Eucharist," "On Death and the Resurrection," etc. The volume is indexed and the table of contents is very full; it is serviceably and neatly bound and printed.

The Conversion of India, from Pantænus to the Present Time, A.D. 193-1893. By George Smith, LL.D. 12mo, pp. 274. New York: Fleming H. Revell Company. \$1.50.

While Doctor Smith is strongly evangelical and while he believes that the conversion of India is one of the great and pressing duties of the Protestant church to-day, he has written in the spirit of a true historian of the facts of his subject. His later chapters, which deal with the present status and outlook of missionary work in India, are preceded by outlines of "The Greek Attempt," "The Roman Attempt," "Francis Xavier and his Successors," "The British East India Company's Work of Preparation," etc. The book is an expansion of lectures given upon the Graves foundation.

The Bishops' Blue Book. By Rev. J. Sanders Reed. 12mo, pp. 208. New York: James Pott & Co.

Mr. Reed's volume might perhaps have been entitled "Some Curiosities of the Episcopate." He has gathered brief anecdotes or histories of scores of eminent bishops, and has arranged them systematically under such chapter headings as: "Age of Consecration," "Laymen Raised to the Episcopate," "Coadjutor Bishops," "Martial Prelates," "Epoch-Makers," "Missionary Bishops," etc., etc.

The Epistles of Paul the Apostle: A Sketch of Their Origin and Contents. By George G. Findlay, B.A. 12mo, pp. 289. New York: Wilbur B. Ketcham. \$1.50.

"To weave the Epistles together in 'o an historical unity, to trace out the life that pervades them, alike in its internal elements and external movements and surroundings" has been the effort of Mr. Findlay. He has written in simple style, free from pedantic detail and cumbersome phraseology. A map of the Pauline missionary journeys is a convenient aid to an examination of the letters of the Apostle.

Outline Studies in the Books of the Old Testament. By W. G. Moorehead, D.D. 12mo, pp. 363. New York: Fleming H. Revell Company. \$1.50.

Doctor Moorehead's position is that of a firm believer in the inspiration of the Bible, and he has not aimed at a critical or expository treatment of the Old Testament. The modest purpose of his studies is to furnish young people with "an analysis of the contents of each book and some of the more prominent features."

God's City and the Coming of the Kingdom. By Rev. Henry Scott Holland, M.A. 12mo, pp. 359. New York: Longmans, Green & Co. \$2.

The thought of these sermons by the Canon of St. Paul's Cathedral gathers about the conception of the Kingdom of God and its organized life in the historic Church. A deep religious spirit dominates every page, and the style has a direct vital energy which strikes home to conscience and will. Many outside of ecclesiastical ranks might enjoy and profit by such words as are here recorded.

The Evidence of Salvation; or, the Direct Witness of the Spirit. By Everett S. Stackpole, D.D. 12mo, pp. 123. New York: Thomas Y. Crowell & Co. 50 cents.

Doctor Stackpole is a practical evangelist who has given much thought to the theme which he now presents in book form. He writes clearly and with great religious earnestness, in the belief that no assurance of salvation is the true one except that of the "direct witness of the Spirit."

The Christ. By James H. Brookes. 12mo, pp. 287. New York: Fleming H. Revell Co. \$1.25.

The author of this volume has previously sent forth a large number of publications of strong evangelical purpose and firm Biblical belief. In the present case his aim has been "to gather up the testimony of the Holy Spirit in the inspired Word concerning the person and work of the Christ."

Be Perfect. Meditations for a Month. By Rev. Andrew Murray. Author's edition. 16mo, pp. 156. New York: Anson D. F. Randolph & Co. 75 cents.

Mr. Murray's object has been to go with the reader "through the Word of God, noting the principal passages in which the word 'perfect' occurs, and seeking in each case from the context to find what the impression is the word was meant to convey."

BIOGRAPHY.

Edward Livingston Youmans, Interpreter of Science for the People. A Sketch of His Life. By John Fiske. 12mo, pp. 603. New York: D. Appleton & Co. \$2.

Mr. John Fiske's sympathy with the life work of his friend Youmans, his well-known stimulating and delightful style and the prominent position Youmans holds in our scientific annals combine to make this volume one of the most important of the spring months. The services of the scientist as the champion of Spencer and of evolution in this country, and as, in general, the "interpreter of science for the people," are the main threads of the life story here told. As a lecturer, author and as editor of the *Popular Science Monthly* Youmans was known to a very wide circle. He was a man from the masses, and his sturdy integrity and fidelity to sometimes unpopular tendencies of thought in his chosen field make his career of great interest to the ordinary intelligent American reader. Mr. Fiske has given us very extensive extracts from Youmans' correspondence, especially with the members of his own family and with Spencer. In the latter portion of the volume nearly two hundred pages are yielded to some select writings of the scientist—"Mental Discipline in Education," "On the Scientific Study of Human Nature," "Herbert Spencer and the Doctrine of Evolution" etc. Like that of many other eminent men of intellectual life Youmans' handwriting was very poor; at least the *fac-simile* (of a brief business letter) which is given upon one of these pages shows an almost undecipherable scribble. The two excellent portraits present the face of the scientist as he appeared at the age of thirty (1851) and at the age of sixty.

Josiah Gilbert Holland. By Mrs. H. M. Plunkett. 12mo, pp. 219. New York: Charles Scribner's Sons. \$1.50.

Mrs. Plunkett's labor in preparing a memorial of Holland has been somewhat in the nature of compiling. "So much of it [the book] is taken from his own works that in a measure it is an autobiographical chronicle, and . . . much of the remainder is made up of the judgment of others concerning him and his works." Holland's life was a simple, almost hum-drum one in many aspects, but one of singular purpose and of almost unprecedented success in the matter of popularity as a story-writer. His high, almost revolutionary conception of the function of journalism, as evidenced in the columns of the *Springfield Republican*, and the unfailing moral, even preaching element in all his literary work, are emphasized in the pages of Mrs. Plunkett's biography. Holland's career was wholesome and encouraging, and it is a good thing now thirteen years after his death to have an unpretentious memorial of the worker and his work. The volume has a number of appropriate illustrations in addition to the two portraits of the man himself.

The Story of Two Noble Lives. By Augustus J. C. Hare. Three vols., 12mo. New York: Anson D. F. Randolph & Co. \$8.

The "noble lives," memorials of which are gathered and preserved in these extended volumes, are those of two English sisters of personal attractions and of rank, Charlotte, Countess Canning, and Louisa, Marchioness of Waterford. A large portion of the record is drawn from the journal and correspondence of the former. While the volumes have been compiled at the solicitation of the friends and relatives of the sisters, and while the interests of private and society life predominate, there is not a little of wider bearing in these pages. They afford us a charming insight into the mental history of high-born English women of our own century; glimpses of court life at London and Paris, and of British government in Ireland and India. That portion of Countess Canning's correspondence during the period when her husband was Governor-General of India, and particularly the portion referring to the Indian mutiny of 1852, is full and illuminative. Considered simply as literature, these memorials are distinctively readable and commend themselves to the lovers of genial correspondence which was never intended for publication. The illustrations are numerous and of a high order.

Memorial of Rev. J. H. Worcester, Jr., D.D., containing a Brief Biography and Selected Sermons. Chicago: Published by the Sixth Presbyterian Church.

The early death of the Rev. John Hopkins Worcester, Jr., D.D., in the second year of his work as professor of Systematic Theology in the Union Theological Seminary, New York, allowed no time for the accumulation of materials which could illustrate to the public the character of his thinking in that department. But the church, which so reluctantly consented to his resignation of the pastoral office, prints for private circulation a number of his valuable sermons, with a biographical sketch and the commemorative discourse by the Rev. Simon J. McPherson, of Chicago.

ESSAYS, BELLES-LETTRES AND LITERARY HISTORY.

Dorothy Wordsworth: The Story of a Sister's Love. By Edmund Lee. 12mo, pp. 226. New York: Dodd, Mead & Co. \$1.25.

The inspiration and sympathy which the poet Wordsworth found in his sister Dorothy throughout the greater part of his literary career are well known to lovers of English literature. Mr. Lee's book has necessarily many things to relate of the poet himself, but the main purpose has been "to gather together into the form of a memoir of her life various allusions to Miss Wordsworth, together with such further particulars as might be procurable, and with some reflections to which such a life gives rise." A few poems of Miss Wordsworth and her "Journal of a Tour at Ullswater" are included. Those who love the quiet byways of literary history can hardly fail to enjoy this simple and clearly-told record of "the most perfect sister the world hath seen."

The Journal of Martha Pintard Bayard, London, 1794-1797. Edited by S. Bayard Dod. 16mo, pp. 141. New York: Dodd, Mead & Co. \$1.50.

Martha Pintard Bayard was the wife of Samuel Bayard, who in 1794 was appointed by Washington as an agent to prosecute in the British Admiralty courts the claims of American citizens, as provided for in Jay's treaty. Mrs. Bayard, at that time a young woman of about twenty-five, accompanied her husband, and her journal of British experiences from 1794 to 1797 is interesting as showing how an American girl of good connections but of democratic beliefs was impressed by monarchical ceremony, aristocratic society and the life of the "mother country" generally. The record is written in a quaint, semi-sentimental tone which is true to the temper of the last years of the eighteenth century. The volume contains two portraits, one of Mrs. Bayard.

Pictures in Prose of Nature, Wild Sport, and Humble Life. By Aubyn Trevor-Battye, B.A. 12mo, pp. 253. New York: Longmans, Green & Co. \$1.75.

Mr. Trevor-Battye is a member of the British Ornithologist's Union and a fellow of several scientific societies. The sketches of his volumes have something of the spirit of a naturalist, but they are written in good style and with an imaginative preception which gives them worthy rank as literary essays, and he has here and there even introduced some bits of pleasing verse. His territorial range extends from Norway through England to Manitoba.

By Moorland and Sea. By Francis A. Knight. 12mo, pp. 215. Boston: Roberts Brothers. \$1.50.

Not a little of the spirit of Jefferies, of his observation, and above all of his delight in Nature permeates the pages of Mr. Knight's latest book. In "Moorland and Sea" is a series of graceful and sympathetic essays upon themes of out-door life in England and Scotland—upon a yacht trip "Round the Mull," an engine ride on the Great Western, upon "Sounds of the Night," "A Northern Moorland," "The Birds-nester" and other subjects delightfully suggestive to the lover of this well-marked field of literature. A number of illustrations increase the book's attractiveness.

Travels in a Tree-Top. By Charles Conrad Abbott. 12mo, pp. 215. Philadelphia: J. B. Lippincott Company. \$1.25.

Doctor Abbott's pleasant chronicles of his out-door wanderings have made his name and literary method familiar to many readers. In general terms his books bear a close resemblance to those of Burroughs and the other poet-naturalists, but there is a good deal of antiquarian musing and investigation introduced. Doctor Abbott's new volume contains sixteen essays in addition to the one which furnishes the title.

Shakespeare's Comedy of the Tempest. With Preface and Glossary by Israel Gollancz. 32mo, pp. 118. New York: Macmillan & Co. 45 cents.

The "Temple Shakespeare," in which edition the "Tempest" now appears, is excellently printed and bound, and of convenient pocket size. In addition to preface, glossary and notes, the present play is adorned with a portrait from the "first folio," which contained the first edition of "The Tempest."

Art for America. By William Ordway Partridge. 12mo, pp. 192. Boston: Roberts Brothers. \$1.

Some of the essays which Mr. Partridge now collects in book form have been previously printed in magazine columns.

They make "no claim to literary merit; but this saving grace they have namely that they have been lived before they were written." In simple direct language and in the moral rather than the technical spirit, Mr. Partridge has discussed: "The True Education and the False," "An American School of Sculpture," "The Outlook for Sculpture in America," "Manhood in Art," "The Relation of the Drama to Education," and "Goethe as a Dramatist."

Aphorisms from the Writings of Herbert Spencer. Selected and arranged by Julia Raymond (Gingell). 12mo, pp. 182. New York: D. Appleton & Co. \$1.

The selections here gathered have been chosen with the idea of illustrating as far as possible the whole range of evolutionary philosophy. They are arranged under such headings as "Education," "Justice," "Politics," "Liberty," "Happiness," etc., and are referred to their original place in Spencer's works. A striking portrait of the great thinker is given as frontispiece.

FICTION.

The Stickit Minister, and Some Common Men. By S. R. Crockett. 12mo, pp. 283. New York: Macmillan & Co. \$1.50.

The Raiders. By S. R. Crockett. 12mo, pp. 364. New York: Macmillan & Co. \$1.50.

Along with a new edition of the delightful sketches of homely Scotch life which Mr. Crockett placed together under the title "The Stickit Minister, and Some Common Men" comes a full-fledged novel by the same rising author. In "The Raiders" Mr. Crockett continues to deal with his familiar Galloway region, but he carries us back to some exciting events among common—not commonplace—Scotch people of the eighteenth century, to a period of violence and outlawry, of kidnapping and incendiarism. One finds here plenty of movement, adventure, of local color, of dialect and of genuine human nature. The story is related in the first person. Mr. Crockett's work so far seems to indicate a very enviable future for himself and a very agreeable addition to the literature which appeals to the fiction-reading public.

Bayou Folk. By Kate Chopin. 16mo, pp. 313. Boston: Houghton, Mifflin & Co. \$1.25.

This is decidedly one of the best volumes of short stories which has appeared for some time. It deals in a very realistic way and with intimate knowledge of various aspects of creole and negro life in Louisiana, mainly in the Natchitoches region near the central part of the State. The narrative is largely in dialect and of sufficient variety of sentiment to make interesting reading throughout. The length of the pieces is all the way from a two-page episode to the opening story, "A No-Account Creole," which occupies some fifty pages. The chapters are exceedingly direct and written simply, without comment. They might remind some readers of certain of finished bits of Maupassant and other French "short story" masters.

Under the Red Robe. By Stanley J. Weyman. 12mo, pp. 340. New York: Longmans, Green & Co. \$1.25.

People are apparently continuing to read and enjoy that form of fiction known as the historical romance in spite of numerous critics. In this field of literature Mr. Weyman's works have taken high rank. His latest production is in the same general spirit as "A Gentleman of France," and is a most stirring tale of adventure and love in the days of Richelieu, written in the autobiographic form, with vigor and with the skill of a good story teller. The ten or a dozen full-page illustrations help the average reader to realize the France of the Seventeenth Century.

Links in a Chain. By Margaret Sutton Briscoe. 16mo, pp. 227. New York: Dodd, Mead & Co. \$1.

Some time has passed since Margaret Sutton Briscoe came before the public in a volume of short stories—"Perchance to Dream"—introduced by Mr. Hamilton Wright Mabie. Those who read the earlier work will be glad to follow the author's progress in her newly-issued book. "Links in a Chain" is to some extent reprinted from *Scribner's Magazine* and is in the nature of a series of closely connected episodes rather than a novel in the usual sense. The style is brisk and dramatic with not a little romantic tendency, and shows evidences of some excellent creative powers. Love and the subtleties of a woman's heart are the main themes of the book.

A Brave Baby, and Other Stories. By Sarah E. Wiltse. 12mo, pp. 152. Boston: Ginn & Co. 55 cents.

The simplicity and sympathy which are necessary to produce good child literature obtain in this little volume, in

which "some stories about very young children are purposely given to help the older ones to a higher moral plane."

Cranford. By Mrs. Gaskell. With a Preface by Anne Thackeray Ritchie. Paper, 16mo, pp. 314. New York: Thomas Y. Crowell & Co. 50 cents.

The Abbé Constantin. By Ludovic Halévy. Paper, 16mo, pp. 166. New York: Thomas Y. Crowell & Co. 50 cents.

These editions of the (translated) French classic and the famous English story of Mrs. Gaskell are of uniform appearance. The illustrations of *The Abbé Constantin* are somewhat more elaborate than those of the other book, which in turn has its pre-eminence in a charmingly written preface by Mrs. Ritchie.

In the King's Country. By Amanda M. Douglas. 12mo, pp. 300. Boston: Lee & Shepard. \$1.

The Prisoner of Zenda. By Anthony Hope. 16mo, pp. 230. New York: Henry Holt & Co. 75 cents.

Love Affairs of a Worldly Man. By Maibelle Justice. 12mo, pp. 311. Chicago: F. Tennyson Neely.

The Bedouin Girl. By Mrs. S. J. Higginson. 12mo, pp. 347. New York: J. Selwin Tait & Sons. \$1.25.

A Fair Jewess. By B. L. Farjeon. 12mo, pp. 396. New York: Cassell Publishing Company. \$1.

Union Down: A Signal of Distress. By Scott Campbell. 12mo, pp. 368. Boston: Arena Publishing Company. \$1.

David of Juniper Gulch. A Story of the Placer Regions of California. By Lillian Shuey. 12mo, pp. 413. Chicago: Laird & Lee.

The Doomswoman. By Gertrude Atherton. Paper, 12mo, pp. 267. New York: J. Selwin Tait & Sons. 25 cents.

Margaret Salisbury. By Mary Holland Lee. Paper, 12mo, pp. 349. Boston: Arena Publishing Company. 50 cents.

The Soul of the Bishop. By John Strange Winter. Paper, 12mo, pp. 316. New York: J. Selwin Tait & Sons. 50 cents.

SCIENCE AND NATURAL HISTORY.

The Royal Natural History. Edited by Richard Lydekker, B.A., F.G.S., etc. With Preface by P. L. Sclater, M.A., Ph.D., etc. Complete in 36 Monthly Numbers. Number I. Quarto, pp. 96. New York: Frederick Warne & Co. 50 cents.

Messrs. Frederick Warne & Co. are about to begin the publication, in parts, of an up-to-date, scientific natural history which shall be worthy of wide popular acceptance and adapted to the uses of the intelligent man, woman or child interested in the subject. An examination of the first monthly number convinces one that the work will be meritorious in all respects. It is written in clear, unilted style, which summarizes in a genial but authoritative way the description of species, their habitats, mode of life, etc., spiced with frequent appropriate anecdotes. The illustrations are to constitute an important element in the attractiveness and usefulness of the natural history. Number I describes the general characteristics of the class mammalia, and proceeds to an account of the man-like apes. The text is adorned by colored plates of lion and lioness and of a group of baboons, by three full-page engravings, and by a large number of other illustrations.

The Story of Our Planet. By T. G. Bonney. Octavo, pp. 547. New York: Cassell Publishing Company. \$5.

Doctor Bonney is professor of geology in University College, London. The scope and style of treatment in "The Story of Our Planet" have been determined by the purpose of reaching "men and women of good general education who might desire to know something of the methods of reasoning which are adopted in geology, and of the general conclusions to which these have led." Technical terminology has been

sparingly used and a short glossary is provided. After an introductory Part I, which treats of "The Story; Its Books and Their Speech," the author divides his subject into the main themes: "The Processes of Sculpture and Molding," "Changes from Within," "The Story of Past Ages" and "On Some Theoretical Questions." The text, which is written in an interesting, lucid style, is explained and beautified by six plates and nearly two hundred other illustrations. The book seems in every particular eminently fitted to perform the services to which it aspires.

The Amateur Telescopicist's Handbook. By Frank M. Gibson, Ph.D. 12mo, pp. 174. New York: Longmans, Green & Co. \$1.25.

Doctor Gibson has aimed to furnish a practical manual for such students of astronomy as use a telescope not beyond a two or three inch altazimuth. He has given large space to matter relative to the construction, care and use of the instrument, and has prepared a catalogue of between four and five hundred celestial objects, conveniently located for the observer's finding.

Total Eclipses of the Sun. By Mabel Loomis Todd. 16mo, pp. 259. Boston: Roberts Brothers. \$1.

Professor David P. Todd, of Amherst College, is editing a "Columbian Knowledge Series," of which this little treatise upon eclipses forms Volume I. It aims to give unprofessional, though thoroughly scientific, information to the general intelligent reader, and to stimulate him to further study. In the main the book is a history of the great eclipses and of the results of the scientific observation of them. There are charts, many illustrations and numerous references to the wider literature of the subject.

The Psychology of Attention. By Th. Ribot. Paper, 12mo, pp. 121. Chicago: Open Court Publishing Company. 25 cents.

This monograph is a second, revised edition of an authorized translation from the eminent psychologist, Ribot. Professor Ribot's treatise is a closely scientific study of the "mechanism" of attention.

Injurious Insects and the Use of Insecticides. By Frank W. Sempers. Paper, 12mo, pp. 199. Philadelphia: W. Atlee Burpee & Co. 50 cents.

Mr. Semper's work seems to be a very creditable and useful one, on a subject important to the practical agriculturist. He has written for the "progressive, inquiring element among farmers and fruit growers." The treatment is direct and systematic, and illustrations are freely utilized for the purposes of identification of species.

Faciology. By La Vergne B. Stevens. 12mo, pp. 205. Chicago: Donohue, Henneberry & Co.

In his brief preface Mr. Stevens states that his boyhood days were spent in a large hotel, and that from that period on he has been interested in studying human nature from the general standpoint of phrenology and physiognomy. His little volume is systematic and is an exposition of the principles of "faciology" with examples and anecdotes; it has many illustrations and is written in a clear, popular style.

EDUCATION AND TEXT-BOOKS.

The Living Method for Learning How to Think in Spanish. By Charles F. Kroeh, A.M. 12mo, pp. 278. Hoboken, N. J.: Published by the Author. \$1.50.

Professor Kroeh's "Living Method" is an excellent example of the proverbial truth that the best way to learn the art of swimming is by swimming. Previous issues of his series have had notice in this department of the REVIEW OF REVIEWS. The volume devoted to Spanish deserves as hearty commendation as its companion volumes. Professor Kroeh has, in some twenty pages, given a clear exposition of Spanish pronunciation, after which he conducts the student steadily forward to a practical mastery of the language for reading and speaking purposes. It would be difficult to devise a more efficient method than that here followed, resting upon the principles: accustom the ear to Spanish sound, the vocal organs to Spanish pronunciation, the mind to Spanish vocabulary and syntax and to the association of the bodily action in general to the Spanish linguistic expression of that action.

Schiller's William Tell. Edited, with notes, by Robert Waller Deering. 12mo, pp. 281. Boston: D. C. Heath & Co. \$1.65.

Doctor Deering in preparing a new school edition of Schiller's famous drama has aimed in his introduction and

notes to satisfy the needs of students who "read Tell as a first classic, early in their German course," and of "advanced pupils who may wish to use the play for rapid reading later." A good map is furnished.

The Contemporary French Writers. By Mademoiselle Rosine Mellé. 12mo, pp. 228. Boston: Ginn & Co. 85 cents.

Mlle. Mellé's selections are from the writers of the latter half of our century—Taine, Renan, Flaubert, Zola, Daudet, Bourget, Sarcey and many other prominent French authors being represented. By grouping the names under the headings "Philosophers," "Naturalists," "Psychologists," etc., and by giving brief, pointed, critical and biographical comment Mlle. Mellé has given a bird's-eye view of the field of literature and of literary theories and tendencies, in so far as criticism and fiction are concerned, in the France of our day. The notes, "historical, geographical, etymological, grammatical and explanatory," occupy about thirty-five pages.

Contes de Balzac. Edited by George McLean Harper and Louis Eugene Livingood. 12mo, pp. 221. New York: William R. Jenkins. \$1.

The introduction of this volume includes a number of pages devoted to the biography of Balzac. The six stories selected are "representative both of Balzac's style and of the scope of 'La Comédie Humaine.'" The comparatively few notes find place at the bottom of the pages.

Le Français per la Conversation. Par Chas. P. Du Croquet. 12mo, pp. 186. New York: William R. Jenkins. \$1.

The French themes used as bases for the conversational exercises of this book are furnished with English translations. There are included also English questions and answers to be rendered into French, the words and music of a number of songs, short vocabularies and some grammatical matter.

An Examination Manual in Plane Geometry. By G. A. Wentworth and G. A. Hill. 12mo, pp. 138. Boston: Ginn & Co. 55 cents.

The aim of the eminent mathematical teachers Messrs. Wentworth and Hill in preparing the present manual has been to give "instruction in the art of handling original theories and problems; and to supply a series of graded test-papers in geometry which can be used not merely as tests of knowledge actually obtained, but also as a means of developing and strengthening the power to originate and carry on a logical train of thought."

A Syllabus of Ethics. By William M. Bryant, M.A. Paper, 12mo, pp. 82. Chicago: S. C. Griggs & Co. 25 cents.

Ethics and the "New Education." By William M. Bryant, M.A. Paper, 12mo, pp. 49. Chicago: S. C. Griggs & Co. 25 cents.

Mr. William M. Bryant, of the St. Louis Normal and High School, is a philosophical writer of merit and an enthusiast in the cause of the "New Education." His pamphlets upon ethics are stimulating, suggestive and of high scholarly and moral tone.

TRAVEL AND GUIDE BOOKS.

Beyond the Rockies: A Spring Journey in California. By Charles Augustus Stoddard. 12mo, pp. 225. New York: Charles Scribner's Sons. \$1.50.

Mr. Charles Augustus Stoddard, the editor of the New York Observer, has heretofore published a number of well-received books of travel. In "Beyond the Rockies" he relates in a genial and ready epistolary style the principal *memorabilia* of a trip from New York, via Chattanooga and San Antonio, to California and the return via Salt Lake and Colorado. The California region receives most attention. Mr. Stoddard's narrative is well aided by more than a score of varied illustrations.

Nicaragua: Studies on the Mosquito Shore in 1892. By Courtenay de Kalb. Paper, 18mo, pp. 53. New York: For sale by the author. 50 cents.

These studies are both historical and descriptive. The diplomatic relations of Mosquitia, as well as the physical features of the region, the character of the people and their government, are treated with considerable fullness. Both the land and the people are now attracting much attention. Probably

no other work exists in English which contains so valuable and recent information on the subject as is comprised in this treatise, which was originally published in the Bulletin of the American Geographical Society.

Cassell's Complete Pocket Guide to Europe. Revised and enlarged. Compiled by Edward King. 32mo, pp. 329. New York: Cassell Publishing Company. \$1.50.

At this season of the year travelers will welcome a new edition of this guide book, planned and edited by Clarence E. Stedman, which has been for some ten years upon the market. The maps are excellent, the vocabulary in English, French, German and Italian serviceable. Notwithstanding that the book contains an extensive array of facts and directions, it will readily slip into an ordinary coat pocket.

Americans in Europe. By One of Them. Paper, 12mo, pp. 241. New York: J. Selwin Tait & Sons. 50 cents.

This is a reissue in cheap form of an anonymous publication—clever, witty, frequently sarcastic and usually spicy in style, and not without a good many serious lessons held in solution. It is dominated by a sincere spirit of loyalty to the right sort of Americanism.

COLUMBIAN LITERATURE.

The Book of the Fair. By Hubert Howe Bancroft. Complete in 25 parts. Parts III to IX. Imperial folio, pp. 40. Chicago: The Bancroft Company. \$1 each part.

The "Book of the Fair," conceived in the spirit of large and intelligent enterprise for which Mr. Hubert Howe Bancroft is noted, grows toward a faithful and eminently successful completion. At the beginning of Part III the reader leaves the account of the inauguration of this great exposition and Part IX closes with matter relating to the separate State exhibits. Mr. Bancroft's text, made live by the use of the present tense, is direct and adequate, but it is largely in the wealth of noble illustration that the great interest and value of the work center. The widest possible range, from portrait to lace texture, is represented as the result of the service of numerous able artists. The "Book of the Fair" does not require indiscriminate praise. It is easily winner in its field, and it is needless to say has met cordial reception not only in the land of the Fair but in many other regions of the globe. Passing time will only give an added value to its verbal and pictorial records.

Review of the World's Religious Congresses. By Rev. L. P. Mercer. Paper, 12mo, pp. 334. Chicago: Rand, McNally & Co. 75 cents.

In the main this summary of the great Parliament consists of generous extracts from the speeches representing distinct types of religious thought. Mr. Mercer, who was a member of the general committee, has also commented briefly here and there. The book contains a considerable number of good portraits and is well printed. It deserves recognition among the briefer chronicles of the Religious Congresses at Chicago last autumn.

Columbus, the Discoverer. A Drama. By Walter Warren. Octavo, pp. 170. Boston: Arena Publishing Company.

While it is not probable that a professional dramatic critic would look with much favor upon the various attempts to dramatize the history of Columbus which have lately appeared, all honest efforts in that direction are worthy of recognition. Under the *nom de plume* of "Walter Warren" is issued a five-act play which presents the great discoverer at various decisive points of his career from the time when he held the large hope against opposition and ridicule to the sad scene of his death. The author has given careful attention to the directions for stage arrangements.

LANGUAGE, ART AND EXPRESSION.

Seven Thousand Words Often Mispronounced. By William Henry Phye. Third Edition. 16mo, pp. 574. New York: G. P. Putnam's Sons. \$1.

In preparing a new edition of his well-known assistant to correct pronunciation, Mr. Phye has taken opportunity to revise thoroughly, and to add a large number of words. As it now stands the book contains the carefully indicated pronunciation of more than 8,600 words which the English-speaking public frequently fails to utter correctly. The list includes a large number of proper names and of words and phrases from foreign languages.

Portrait and Figure Painting. By Frank Fowler. Quarto, pp. 68. New York: Cassell Publishing Company. \$2.

Mr. Fowler contributes these studies to the series of "Art Amateur Handbooks" edited by Montague Marks. Assuming that the reader already has some knowledge of drawing, Mr. Fowler has written for the purpose of giving practical detailed suggestions to students and has confined himself closely to the subjects of the title. The volume is illustrated with three colored plates, showing progressive stages in oil painting.

The Heart of Art: An Economic System of Expression. (For Self-Help.) By G. Swede Lewis. Quarto, pp. 157. New York: Nevius & Kane. \$2.50.

Mr. Lewis has high opinions of the Art of Expression, and is a teacher of the subject. His little book aims to give stimulus as well as practical instruction to the student of oratory, stage effect, of speech and bodily bearing in general.

ATHLETICS AND AMUSEMENT.

Athletics for Physical Culture. By Theo. C. Knauff. 12mo, pp. 422. New York: J. Selwin Tait & Sons. \$2.

Mr. Knauff's treatment of athletics is systematic, but it is not labored and is noticeably free from technical terms and professional pedantry. He has chapters devoted to "Gymnasium Work," "The Lighter Gymnastics," "Equestrianism," "Women in Athletics," "Questions of Hygiene," "Outdoor Life," and to most of the recognized field sports severally considered. He writes in a sensible and genial way and his book is an enjoyable as well as useful one. It is extensively illustrated, and is well bound and well printed.

Puzzles Old and New. By Professor Hoffman. 12mo, pp. 414. New York: Frederick Warne & Co. \$1.50.

The contents of this gayly-bound volume will prove a boon to invalids, to persons who must needs while away a dull evening, to the minds of eager children and to all in search of amusement in the world of Puzzledom. The author has collected his materials under the sections: "Puzzles dependent on dexterity and perseverance," "Mechanical puzzles dependent on some trick or secret," "Dissected or combination puzzles," "Arithmetical puzzles," "Word and letter puzzles," "Puzzles with lucifer matches," etc. The book has a pleasant appearance and is finished with a goodly number of illustrations.

MISCELLANEOUS.

"Sharps and Flats:" A Complete Revelation of the Secrets of Cheating at Games of Chance and Skill. By John Nevil Maskelyne. 12mo, pp. 365. New York: Longmans, Green & Co. \$1.50.

Mr. Maskelyne, like Heine, holds himself to be a soldier in the liberation war of humanity, his particular attack being upon "humbug and pretense." Though he has had a serious purpose in preparing the pages of "Sharps and Flats," it is probable that the book's value will be judged as much by the canons of entertainment as by those of ethics. Mr. Maskelyne does not investigate the history of fraud, but presents the facts of its present-day rule. These sentences from the introduction certainly do not flatter our own country: "From the spirit medium to the wooden nutmeg they [swindling schemes] all hail from that most 'go-ahead' and yet most easily hoodwinked country, America;" and "Even the English sharp himself is in a condition of unsophisticated innocence compared with his American rival." The author apparently has an intimate knowledge of his subject, and he employs an easy straightforward and adequate style. There are sufficient illustrations.

The Peerless Cook Book. Compiled by Mrs. T. J. Kirkpatrick. 16mo, pp. 320. Springfield, Ohio: Mast, Crowell & Kirkpatrick. 25 cents.

Mrs. Kirkpatrick's compilation contains somewhat more than a thousand practical recipes for the ordinary household, and suggestions upon various subdivisions of the culinary and housekeeping arts. The book is illustrated and indexed.

The People's Atlas of the World. Folio, pp. 124. Springfield, Ohio: Mast, Crowell & Kirkpatrick. 50 cents.

Considering the sum for which this atlas is sold, the purchaser will probably be well satisfied with its maps, descriptions and tabular matter. The larger number of pages are given to examination of the several States of the Union, with illustrations of scenery, buildings, etc., and with maps.

CONTENTS OF REVIEWS AND MAGAZINES.

AMERICAN AND ENGLISH.

American Amateur Photographer.—New York. March.
Ametropia as an Element of Art Criticism. G. E. Blackham.
 Column for Beginners.—V. By John Clarke.
 Why Do Silver Prints Fade? John Janeway.
 Developers Old and New.

The REVIEW OF REVIEWS is, in the best sense, an illustrated history of the times, and as such is pre-eminently worthy of preservation in well-bound volumes.

Complete unbound volumes delivered to us, postage or express pre paid, and in good condition, with covers on, will be bound and returned, charges prepaid by us, for 75 cents a volume. Back numbers, for filling out volumes can be supplied as far back as April, 1892. For this specific purpose we charge 20 cents a number.

THE REVIEW OF REVIEWS, AMERICAN EDITION, EDITED BY ALBERT SHAW

The Review of Reviews is published each month in New York and London, the two editions differing in many features, but publishing numerous articles in common. The English Edition is edited by W. T. Stead, Mowbray House, Norfolk St., Strand, London.

CONTENTS FOR JUNE, 1894.

VOL. IX.

NEW YORK, JUNE, 1894.

No. 6

THE PROGRESS OF THE WORLD.

A Non-Partisan Naval Policy.

The discussion of the Naval Appropriation bill in the House at Washington has provoked displays of partisanship that are much to be regretted. One of the most fortunate circumstances attending the making of our new navy has been the fact that the policy has received the active support of broad-minded Americans without regard to party lines. As a simple matter of history, so far as the outward and accessible facts are at hand, the new navy was begun under the administration of President Arthur and during the incumbency as Secretary of the Navy of the Hon. William E. Chandler, of New Hampshire. The late John Roach, and the facilities which his shipyard afforded, made possible the construction of modern steel warships in this country a dozen years ago. Mr. Chandler's successor to the naval portfolio was the Hon. William C. Whitney, of New York; and Mr. Cleveland's first administration, with a Congressional support that knew no party lines whatever, carried forward with brilliant success the good work that had been begun. The treatment to which Mr. John Roach was subjected by the government at that time, with results so unfortunate and so pathetic, leaves an unpleasant memory. But Mr. Whitney seemed rapidly to grow out of a narrow and partisan view of his functions, and before his period of authority was ended he was accomplishing a great national work in a manner that won for him the admiring recognition of Republicans as well as Democrats; and he was liberal minded enough not to reject the advice and co-operation of his political opponents. The Hon. Benjamin F. Tracy, as President Harrison's Secretary of the Navy, had the frankness and grace to bestow unqualified praise upon the work of Mr. Whitney, and he proceeded, with no narrower measure of enthusiasm and capacity, to enlarge upon a task which he interpreted in the highest and most patriotic spirit and which he prosecuted with conspicuous disregard of mere party claims and pretenses. He maintained the most cordial and valuable relations with Mr. Herbert, the Democratic chairman of the House Naval Committee. Upon the return of Mr. Cleveland to the White House, the country was gratified to know that Mr. Herbert him-

SECRETARY HERBERT OF THE NAVY.

self would serve from 1893 to 1897 as Secretary of the Navy, because this appointment indicated the continued development of the fleet as a national undertaking in a non-partisan spirit. It must undoubtedly be deeply disappointing to Mr. Herbert to find that a Democratic Congress is now unwilling to authorize the construction of the additional ship which by common understanding was to have been ordered at each session. The great falling off in public revenue, owing to trade depression, has been made the ground of a refusal by the House Naval Committee to adopt Secretary Herbert's recommendations regarding a new battle ship. It is not impossible that when the Naval

Appropriation bill is reached in the Senate that body may take a more far-reaching view of the subject, and may endeavor to convert the House to Secretary Herbert's programme. But in any case it would seem that the Republicans are not justified in the taunt that the new navy is solely a creature of their own party policy and that its further development ceases at once when the Democrats obtain full control of all branches of the government. At least one more year must elapse before such a charge could have any serious justification. Our lawmakers and administrators at Washington would do well to remember that the immense expansion of the British navy which has just been entered upon is a non-partisan policy. While the details of that policy belong of necessity to the Liberal Government, the demand came even more emphatically from the Conservatives than from the Liberals; and although it is altogether likely that the Liberals will soon be succeeded in power by the Conservatives, no one for a moment supposes that there will be any lack of perfect continuity in the national policy regarding the navy. It is equally true concerning France that while controversies between political factions and cliques have reached violence, there has been no partisanship in the policy of the development and maintenance of the navy. The people of the United States will not sanction an attempt to make party issues out of the thoroughly popular and thoroughly non-partisan policy of an adequate American navy.

*Shipbuilding
on the
Mississippi.*

If, as seems well-nigh certain, Congress will fail this year to authorize any additions to the fleet of large warships now built or in process of designing or of construction, it is at least quite well assured that several new torpedo boats will be ordered. The Senate is in favor of a considerable number of these small but effective adjuncts of the modern navy. As yet, although our inventors and designers have led the world in this field of enterprise, our government has constructed very few torpedo boats. Fresh attention is called to the subject by the launching at Dubuque, Iowa, of the *Ericsson*, which will very shortly be in readiness for her trial trip. She will be the fastest craft owned by our government, and in some respects, if not in all, may be regarded as the most formidable and perfect specimen of her class of vessels that any navy possesses up to the present date. That this consummate triumph of progress in the arts of shipbuilding and marine warfare should be constructed by builders on the Iowa bank of the Mississippi river is a highly interesting and significant fact. The torpedo boat of necessity requires little depth of water, and there is no reason why various builders located on our interior waterways may not compete successfully with those on the seaboard in the future construction for the government of these light-draft vessels as well as of gunboats and other craft intended for lake and river use. With the deepening of channels and the construction of interior ship canals, we shall see an ever-increasing development of marine construction at interior points.

*English Honors
Paid the
American Navy.*

A pleasant international incident making for the promotion of peace and good understanding between nations which ought for every reason to cultivate the closest relations, has been the reception and high honors paid to the new American navy through the courtesies extended to the officers of the cruiser *Chicago*, which has been visiting the English coast. The *Chicago* is under command of Captain Mahan and is the flagship of Commodore Erben. These two distinguished officers of our navy have certainly had reason to consider England a country eager to show hospitality to official representatives of America. Captain Mahan has brought great credit to the American navy by his remarkable book on "The Sea Power in History," a work which has met with almost unexampled favor throughout Europe and which has been received with especial enthusiasm in the British navy. While the cruiser *Chicago* and its worthy representatives of the American navy have been helping to cement the friendly ties that unite the two great English-speaking countries to each other, the American and British fleets have entered upon a co-operative patrol of the North Pacific and the Bering Sea for the enforcement of the new regulations protecting the seal fisheries. All signs point towards the carrying out in perfect good faith of the prescriptions of the Paris tribunal of arbitration, with the result of a most worthy object lesson in international co-operation as opposed to friction, bickering and strife. Everything now visible indicates the possibility of intimate relations between Great Britain and the United States that will make not only for the advantage of the two countries but also for the peace and welfare of the whole world. But this very outlook, far from affording a reason why the United States need not trouble itself to build a navy, calls emphatically for the considerable further development of our fleet. We shall have no uses for a vast floating armament like England's, but we need ships enough to perform promptly and creditably the many errands that our national interests create, and in addition we must recognize the desirability of a moderate number of battle ships as a means of defense. The possession by our government of a modern navy up to a certain point is a guarantee of peace rather than a menace of war.

*Ship Canals
for Seaboard
Defense.*

The question of battle ships and naval equipment always suggests the kindred topic of harbor and coast defense against the warships of an enemy. It is universally admitted that our great seaboard cities are in a more exposed condition than those of other nations. While it is also true that the danger of an attack upon Boston, New York, Brooklyn, Philadelphia and Baltimore is very remote, the question how these cities might be most adequately protected in case of war is a legitimate one, and prudence demands its careful consideration. It is somewhat to be wondered at that the United States government has not long be-

PROPOSED CAPE COD CANAL.

fore this time definitely adopted the plan of an inner line of coast waterways as the most effective part of a general scheme for defensive operations. The conformation of the Atlantic Coast is such that a few ship canals,

—none of which would afford serious engineering difficulties, and the sum total of which could be constructed at a cost that would not be prohibitive, —would give a water passage protected almost the entire distance by islands or natural breakwaters from Boston to New Orleans. Alluding to this subject the *New York Tribune* expressed itself on the 16th of May as follows: "Three or four such canals, short and not exorbitantly expensive, would afford continuous navigation from Cape Cod to Cape Hatteras, enabling fleets of monitors or other coast-defense vessels to be moved from point to point in safety, and with a secrecy and celerity that would hopelessly baffle the strategy of any attacking fleet. Such a system might even be extended along the entire coast from Boston to New Orleans, and while its commercial utility at all times would probably make it a profitable investment, its strategic value in time of war would be beyond all reckoning."

An Inland Voyage
from Washington
to New York.

In this connection it is worth while to note the fact that the United States torpedo boat *Cushing*, with

her full fighting crew of twenty men and with ballast weighing as much as the torpedoes she would have had to carry in time of war, made a trip on the 9th and 10th of May from Washington to New York without going to sea at any point. She accomplished the run in twenty-eight and a half hours, having traveled ninety miles down the Potomac from Washington, and

ACROSS DELAWARE.

then one hundred and ten miles up the Chesapeake Bay to the entrance of the Chesapeake and Delaware canal. Fourteen miles in this canal took the *Cushing* across the little State of Delaware into the broad estuary of the Delaware river. Fifty-five miles up the Delaware river brought her to Bordentown, N. J., and forty-four miles in the Delaware and Raritan canal brought her into the Raritan river near its entrance into the lower bay of New York by way of Raritan Bay. The last link carried her out of the mouth of the Raritan and up the bay into New York harbor. This is the first time that the inland water route has been employed by a war vessel of the government. The *Cushing* draws only five feet and a half of water. What is desired is the construction of ship canals which will admit large ocean-going vessels drawing from twenty to twenty-five or twenty-six feet of water.

The Commercial
Demand
for Ship Canals.

If strategic ends alone were to be considered, there would be reason for giving serious attention to the proposal to construct these ship canals. Money spent

in this way would mean a saving of a considerable amount which would otherwise be needed for fortifications, heavy coast ordnance, and other forms of defensive construction. But it happens that commerce is calling loudly for the deep canal across New Jersey and also for the one connecting the Chesapeake Bay with the Delaware river. Chambers of Commerce, leading newspapers, and other representatives of public opinion in the cities of Philadelphia and Baltimore are just now most urgently demanding the construction of these canals. With a ship canal from some point near Bordentown or Trenton to the Raritan Bay, there would be an enormous water traffic between Philadelphia and New York; while the construction of the Chesapeake and Delaware canal would give a sheltered and direct water passage from Baltimore by way of Philadelphia to New York, and would reduce the distance to about one-third of that which vessels must at present travel in going between these important ports. It is so evident that these desirable public works would be justified on business grounds that they would probably have been constructed long ago by private capital but for the prospect that the government would assume their construction as a matter of general welfare and public utility. The two cities

FROM PHILADELPHIA TO
NEW YORK.

representatives of public opinion in the cities of Philadelphia and Baltimore are just now most urgently demanding the construction of these canals. With a ship canal from some point near Bordentown or Trenton to the Raritan Bay, there would be an enormous water traffic between Philadelphia and New York; while the construction of the Chesapeake and Delaware canal would give a sheltered and direct water passage from Baltimore by way of Philadelphia to New York, and would reduce the distance to about one-third of that which vessels must at present travel in going between these important ports. It is so evident that these desirable public works would be justified on business grounds that they would probably have been constructed long ago by private capital but for the prospect that the government would assume their construction as a matter of general welfare and public utility. The two cities

of Philadelphia and Baltimore could afford to build these canals as municipal undertakings if there were no other way to have the work done. Neither of these would involve such difficulties, either legislative, engineering, or financial, as the great Manchester ship canal has met and overcome. What Cincinnati did for its trade when it constructed the Cincinnati Southern Railroad as a municipal enterprise, what Glasgow has done for itself through its Clyde Navigation Board, what Manchester, Brussels, and other foreign cities have done and are doing for improved waterways and transportation facilities, Philadelphia and Baltimore might easily do. They could construct the canals and charge tolls which would pay interest and eventually redeem the bonds. But would it not be far better that the canals should be constructed by the general government and made a part of our free national system of waterways, while also serving their strategic purpose in our scheme of coast defenses? In one way or in another they ought to be constructed with the least possible delay. Sooner or later also Boston and New York, together with the ports that lie between, should see that a ship canal across Cape Cod is constructed and that the close inland passage in continuation of Long Island Sound is, so far as possible, carried up the New England coast. Then the scheme of a sheltered coastwise water passage might well be applied further south, including the utilization of the natural channels along the coasts of the Carolinas and Georgia, and the construction of the long-proposed ship canal across the peninsula of Florida. These projects are by no means chimerical. They are as practical as anything that has ever been proposed. We should have constructed these and still other ship canals long ago, but for the disproportionate development of our railroad system and the strength of the railway interest as opposed to the competition of waterways.

*The Senate's
Tariff
Muddle.* It is not harsh to assert that the metamorphosed Wilson bill, which includes the revised tariff, the revised internal revenue system, and the newly-invented income tax, has assumed a form that disgraces the United States Senate and that brings contempt upon the political party now exercising full power and responsibility. For a number of weeks the bill as it arrived from the House of Representatives was detained in the hands of the Democratic majority of the Senate Finance Committee. At length it emerged and was reported to the Senate by Mr. Voorhees, the committee's chairman. It had undergone important modifications, the principal one being a restoration of duties upon sugar, while other important crude products such as iron ore and coal were placed upon the taxed list. Free wool still remained to justify Mr. Wilson's claim that the chief merit of his measure lay in the freeing of great fundamental products which lay at the basis of manufacturing industry. A heavy Senatorial debate began forthwith, upon a scale which promised several months of talk before a final vote

Photograph by Bell.

SENATOR CALVIN S. BRICE, OF OHIO.

could be reached. Dissatisfaction with one feature or another of the measure was so evident that there was serious doubt whether the Democratic majority could be held together. It was understood that certain Democratic Senators, quite apart from the Finance Committee, were engaged secretly upon a so-called compromise tariff which would be accepted by all shades of Democratic opinion in the body, and would minimize obstruction and opposition on the Republican side,—thus insuring a speedy vote and final reference of the whole subject to conference committees of the two Houses. Senator Calvin S. Brice of Ohio was authority for the statement that such a com-

promise was in the course of preparation and that the tariff question would be speedily settled. This assurance was given by him at a time when it was needed to influence the result of a hotly-contested special Congressional election in the third Ohio district. Senator Voorhees strenuously denied the charge made by Republican Senators that the compromise was shortly to be introduced; but he was within a few days shown to be in error by the actual submission, in one lump, of more than four hundred amendments to a measure which had been maturely considered by the Finance Committee and deliberately introduced as their final report. The amendments were accepted as authoritative by the Democratic majority, against the single protesting voice of Senator Mills, of Texas. The changes were made upon no principle whatever excepting that of a distribution of favors to special interests. The Wilson bill, while in every sense a protectionist and discriminating measure, at least made a considerable average reduction of rates below the McKinley level; and the Senate committee's revision of the Wilson bill, while tending in the direction of higher rates, had left the great majority of duties where Mr. Wilson had fixed them. But the several hundred amendments belonging to the Brice-Gorman compromise materially increase the rates; and in a few particular cases, it is asserted, they make the duties considerably higher than those of the McKinley act itself. The tenor of these amendments also is to restore specific duties where the Wilson bill had adopted the ad valorem principle. The latest adjustments of the sugar tariff make such discriminations in favor of refined grades as are highly profitable and agreeable to the sugar trust.

*The Somersault
of the
Democratic Party.*

When one considers the loss to every business interest that results from the suspense and disturbance of new tariff legislation, it is evident to any unprejudiced mind that the retention for some years to come of the McKinley act precisely as it stands would be greatly preferable to the adoption of a measure like the one now pending in the Senate, which settles nothing either as to principle or as to practice. The Democratic party has shamelessly and scandalously ignored the promise upon which it came into power to give the country a tariff on revenue lines. The Wilson bill as originally drafted by the Ways and Means Committee of the House was a faltering and lame attempt to take one infinitesimal step in the direction of a revenue tariff. But the amended and revised bill now under consideration in the Senate has retraced that little step, and the Chicago platform is without a defender in the halls of Congress. Even Mr. Mills, of Texas, while opposing the compromise, announces that he will vote finally for any tariff bill which makes a reduction of duties by the very smallest degree. His position is an absurd one, for it means in plain English that Mr. Mills would justify a disturbance of business interests that costs the country hundreds

of millions of dollars for the sake of a slight nominal reduction of tariff rates, when the altered rates would be just as effectively protective as they were before. So long as the principle remains unaltered, nothing whatever is accomplished by a casual reduction, here and there, of tariff rates; and such work would be the most trifling child's play but for the mischief it accom

Photograph by Bell.

SENATOR ARTHUR P. GORMAN, OF MARYLAND.

plishes. Curiously enough, the income tax holds its place practically unaltered in the Democratic scheme. The one great plank of the Democratic platform pronounced protection unconstitutional and demanded a revenue tariff. This has been repudiated without cause and without apology. But the Democratic platform did not mention in any way the laying of a tax upon incomes, while this was one of the principal features of the Populist programme. The Democrats in Congress have now made the income tax their one

distinctive tenet. The country will hardly again in twenty years accept any pretense from the Democratic party that it is opposed to protection, and that party will apparently be compelled to stand or fall upon a totally new doctrine which has never had a place in its platform except by way of condemnation of the Republican income tax of the war period. The situation is a highly absurd one, and the Democratic party will have no light task in adjusting itself to its novel position.

Senatorial Gossip and Scandal. It is difficult to ascertain to what extent Mr. Cleveland and the administration are responsible for the extraordinary condition of the pending revenue measures. Mr. Cleveland and Mr. Carlisle by their recommendation to Congress of a tax upon corporate incomes, opened the door for the income tax now pending. But it is said in private that neither of these gentlemen is personally favorable to the existing proposition. It is also asserted with great particularity that the administration is responsible for the new sugar schedules. But remarks of this kind are always to be taken with extreme caution. The controlling hand in the preparation of the pending compromise tariff, and the real arbiter of Democratic measures and destinies in the Senate, is Mr. Gorman, of Maryland, whose skill as a politician and whose resources as a log-roller and a legislative tactician are probably without an equal in this generation of American public men. The Republican protectionists have taken less kindly to the compromise than was expected, and have entered upon a sturdy and united opposition that does not promise an early end to the stream of debate. Vague rumors of bribery led to the adoption by the Senate on May 16 of a resolution to investigate all charges of the kind, and a committee of five, headed by Senator Gray, of Delaware, was appointed to inquire into the scandals. The most serious accusation had to do with campaign and corruption funds emanating from the Trust of the sugar refiners, and with the speculations of Senators who are said to have bought and sold sugar stocks on the strength of "tips" from the Finance Committee room.

The Great-Northern Arbitration. Through the industrial smoke and the political fog of a troublous and indecisive month, there shines in the Western sky the bright radiance of one splendid and memorable event. The general railroad situation had seemed to compel the Great Northern system to cut down wages and otherwise to put its men upon a hard-times basis. The result was a strike that practically paralyzed traffic on several thousand miles of railway lines. The Great Northern system ramifies Minnesota and the Dakotas, and extends across Montana to the Pacific Coast. Its headquarters are at St. Paul, and its main Eastern traffic terminals are at Duluth and Minneapolis. The strike was not only a disastrous thing for the road and for the workmen, but it was a costly and exasperating infliction upon the many cities and towns whose trade was tied up. Under these circumstances, the business

men of Minneapolis and St. Paul determined upon intervention. Their good offices were accepted by both parties in the controversy, and their decision, after a careful hearing, was accepted as a basis for immediate adjustment of all differences. The incident reflects great credit upon the good sense and good faith of all who were concerned, and it bears new witness to the character and intelligence that have placed the stamp of superiority upon the "Twin Cities" of the Northwest. President James J. Hill of the Great Northern system, moreover, has set an example that wholly confirms the good opinion of him which already prevailed. He showed himself magnanimous, just and strong in his acceptance of the plan of arbitration and in his consent to a verdict that was largely favorable to the claims of the strikers. In the added loyalty of the employees, and in the strong approval of the public, Mr. Hill and his corporation will soon gain far more than they might for the moment seem to have lost by submitting to arbitration.

How it all Came to Pass. It should be borne in mind that it was President Hill himself who made the original proposition to the strikers that all differences should be arbitrated. He had asked the men to return to their positions at once, allowing questions in dispute to be settled by three arbitrators, one of whom should be named by the strikers, one by President Hill, and the third by these two, or, in case of their failure to agree upon a third man, the selection to be made by Judge Nelson or by Judges Nelson and Thomas together. The strikers had refused to arbitrate and had declared that they would accept nothing short of a restoration of all wage schedules existing before last August. Thus the men had put themselves in a false position and were in peril not only of losing their immediate cause but also of hurting the general cause of industrial peace and of the rational progress of workingmen's interests. Heretofore it has almost always been the arrogance of railway managers that has prevented a resort to arbitration. In this case Mr. Hill had made a perfectly fair offer which ought to have been eagerly embraced by the strikers. What finally happened is well summed up in the following paragraph which we quote from the *Advance* of Chicago:

Arbitration finally settled the Great Northern strike in a way entirely unexpected to the two parties chiefly concerned. President Hill's arbitration proposal had been rejected by the employees. Mr. Debs, who had charge of the strike, had declared that there was nothing to arbitrate; that the workmen would take nothing but complete restoration of the former wage schedule; and Mr. Hill on the other hand had announced that he would fill the places with new men and run the road. A board of arbitration, however, was appointed by the commercial bodies of St. Paul and Minneapolis, of which Mr. C. A. Pillsbury was chairman, which discharged with conspicuous ability the difficult task of first discovering what seemed to them to be the right disposition of the case, and then getting the contending parties to agree to it. They succeeded in getting 90 per cent. of the disputed schedules amicably settled in a conference between the

officers of the company and the labor representatives; and 75 per cent. of the remainder they decided should be restored to the former rate. Both sides claim a victory, but that is the least important part of this triumphant conclusion. The important thing is that both sides express themselves as satisfied with the settlement, and both are warm in their praise of the manner in which it was brought about, and deprecate any violent measures in future differences. Mr. Debs said, speaking for the American Railway Union, "I am sure the precedent here established will endure, and that the great principle of arbitration will be established for all time to come." President Hill said, "I feel confident in the future in the prospect of approaching all questions peaceably and settling all questions fairly and justly." Thus ends one of the greatest railroad strikes in a conspicuous triumph of the arbitration policy. The strife between the different labor unions seems to have dropped out of sight, but in this the American Railway Union has triumphed in its dispute with the older brotherhoods.

This triumph of reasonableness and moral principle at a time when the industrial situation in general is so disturbed, and when evil counsel is so vociferous, may well give cause for congratulation and encouragement.

*The Strike of
200,000
Coal Miners.*

If the strike along four or five thousand miles of Great Northern railroad lines was a blow to industry and a source of inconvenience and loss to many communities, its proportions were small in comparison with the magnitude of the concerted strike of bituminous coal miners throughout the country. A few bituminous districts have not joined in the strike, but probably not less than four-fifths of the output of coal in the United States (excepting from the anthracite mines, which are not involved) was summarily shut off by the great strike of the miners. From 150,000 to 200,000 workers have been co-operating in this attempt to secure a restoration of the rates of wages that existed prior to reductions made during the past winter. The rates formerly paid made it possible for coal miners to earn upon the average something like two dollars a day when fully employed. In practice, however, the uncertainty and irregularity of work kept their incomes down to six or seven dollars a week. The great strike, which has brought the industries of the country face to face with a coal famine, is due primarily to great reductions in the price per ton paid for mining. These reductions have differed in different mining regions. They seem to have begun in the northern Illinois mines, whose operators excuse themselves on the score of the necessity of meeting the competition of the southern Illinois output. The action of northern Illinois operators affected the Indiana and Ohio employers in turn, who met the situation by heavy reductions, being followed promptly by the operators of Pennsylvania mines. The reductions in all or nearly all cases seem to have been made in flat violation of existing agreements. Thus upon the face of the situation the miners are in the right. Their contention is for what has come to be termed a "living wage." They are reduced to the direst straits by the smallness and precariousness of

the income they have been earning for many months past, and have made up their minds that they have nothing to lose and everything to gain by an indefinitely protracted strike. If conditions were sufficiently alike to make possible a single schedule to cover the whole bituminous belt, a solution would be comparatively easy. The operators of many of the important mining districts met with representatives of the united miners in a conference at Cleveland, Ohio, on May 15; but several days of conference only made more apparent the wide differences of view between the contending parties, and the difficulties of a solution that would embrace the mining interests of a large number of States. Arbitration is hardly to be hoped for in view of the temper of the combatants, although that method would unquestionably secure better results for both sides than either can permanently gain from the trial of brute strength. The recurrence of a few more struggles like this one will convert a good many conservative men to the doctrine of a public monopoly of mines, or else to some form of compulsory arbitration.

*As to the
Industrial
Armies.*

Compared with a great, definite, grim struggle like the strike of the miners for honest treatment and for the restoration of the irreducible minimum of living wages, the numerous bands of adventurers known as "industrial armies," or "Coxeyites," are but the byplay of the social movement. They lie merely upon the surface of the situation, and indicate nothing in particular excepting a considerable amount of unrest and uneasiness in the world of labor. They are very different from the marching mobs of half-starved men who sometimes parade in London, demanding work or bread. The largest ingredient in the great mixture of impulses to which this fantastic industrial army movement is due is the American love of adventure, excitement and change. There has been no indication of crushed spirits, sullen despair or hopeless misery. On the contrary, the most flourishing of these armies have exhibited some of the same buoyant mood that leads men to flock to new mining camps or to march in political parades. A nation that has grown as rapidly as ours, and that has shown so marvelous a mobility in the tidal ebbs and flows of its population, has always to reckon upon a considerable element of men who lack the sense of attachment to locality and who find change and adventure essential to their happiness. A great number of these roving spirits have found their way to remote parts of the West and have engaged transiently in mining and various other pursuits. The temporary paralysis that has overtaken the industries of the West has revived the migratory instinct in many hundreds of these men of slight local attachment and of no domestic *impedimenta*. Consequently, they rally readily enough around the banner of a "General" Frye or a "General" Kelley, or any one of twenty other "generals," and are more than willing to try the adventure of a march on Washington. Their disposition to steal rides on freight trains, and even to steal the trains

themselves, has certainly been reprehensible, yet it is only fair to distinguish between their lawless conduct and that of out-and-out criminals and highway robbers. The social phenomena of the depressed periods that follow money panics and industrial crises in the United States are worth studying. Levity on a vast scale is always sure to assert itself. After all, the key to an understanding of American life is to be found in our American kindliness and sense of humor. While very many earnest gentlemen with knitted brows are endeavoring to fathom the deep significance that underlies "Coxeyism" and the simultaneous desire of numerous companies of American citizens to proceed to Washington with petitions for "good roads," and schemes for paper-money millenniums, it may seem like scandalous trifling to declare that the whole movement is essentially a light-hearted one, yet such is the truth.

The Rationale of Coxeyism. For the most part the various "armies" have been composed of well-meaning fellows who have not a bit either of dangerous malevolence or of lofty social idealism in their hearts or minds, and who have no more affiliation with bloodthirsty anarchists than have the children of a Philadelphia Sunday-school. It is true that an element of good-for-nothing tramps has infested the armies to some extent, but this class has not been predominant. We have in the past six months been face to face with most serious problems presented by a lack of work for hundreds of thousands in our great cities; and within a few weeks we have witnessed in different parts of the country some frightful scenes of disorder in connection with bitterly contested strikes. These have been the serious features of the year's industrial depression. The Coxey march and other kindred diversions have, on the contrary, helped to relieve the strain and to maintain the national cheerfulness. It is true that we ought to view with great solemnity and alarm the lawless spirit shown by companies of men who have dodged deputy marshals, police squads and cavalry detachments, while speeding across country on railroad trains borrowed without consent of the owners. Yet to be perfectly frank and truthful, we must confess that almost everybody has looked on with more amusement than solemnity. When the business revival comes and work is plenty, the temptation to steal rides and go to Washington in advocacy of Mr. Coxey's good roads bill and other theoretical propositions, will vanish as by magic. It is worth while to note the fact that the "armies" have been treated with almost universal kindness by the people along their routes of travel; and apart from their evil propensity for stolen rides, the banded adventurers have done no harm worth mentioning. It has been a great mistake to denounce them as if they were bands of criminals or anything else than what they are, namely, bodies of American pilgrims bound on a merely fantastic and adventurous journey, under the leadership of ill-informed and visionary men whose energy and capacity for organization happen to find an outlet in this plan of a march to Washington. The Kelley army has been

much more interesting than Coxey's, and the tale of its journey on flatboats down the Des Moines river from the capital of Iowa, makes a really romantic chapter, and one worth the attention of any student of practical social conditions. General Kelley's performance, however, like General Coxey's, is apropos of nothing in particular. It is merely a fresh evidence of the elasticity of the American spirit.

Public Affairs in New York.

The convention elected to revise the constitution of the State of New York has duly entered upon its long summer's task. As had been expected, the presidency was conferred by his fellow delegates upon New York's distinguished lawyer and orator the Hon. Joseph H. Choate. His opening speech was a plea for the undivided devotion of the members to the great responsibilities that rest upon them, and for a wise and judicious rather than an extreme and experimental temper. A series of valuable object lessons in the opening days of the convention,—though not intended primarily to instruct the body sitting under Mr. Choate's chairmanship,—could hardly fail to have a stimulating and permanent effect. We refer to a succession of veto messages from Governor Flower. Before its final adjournment the New York legislature had passed a number of measures designed to secure improved government in several of the larger cities of the State, especially in the city of New York. Governor Flower received the bills and dealt with them at his leisure, one by one, rejecting most of them with elaborate and caustic comments. It is claimed that these vetoes were meant to serve the interests of Tammany Hall and of machine political rule. Their real effect, however, has been to give a crowning and final illustration of the futility of all attempts to reform the city government of the large communities of New York by any kind of piecemeal legislative intervention from Albany. The constitutional convention must now perceive, with a new clearness, the absolute necessity for a uniform and lasting system of municipal government resting upon the principle of local home rule. The retirement of Mr. Richard Croker from the headship of Tammany Hall and from active political life is taken as a sign that this shrewd leader regards the palmy days of Tammany as numbered. One of the bills vetoed by Governor Flower provided an appropriation for the expenses of the pending legislative investigation of the police and other city departments of New York. The investigation will not be checked by the Governor's action, but on the contrary will proceed with the greater vigor, the question of expense not being a vital one in a cause which has enlisted the support of all friends of good government on Manhattan island.

The Question of Woman Suffrage.

The opening of the constitutional convention has been attended by an unusually spirited discussion of the question of extending the franchise to the women of the State of New York. At the time when the delegates were elected last fall there was little or no apparent interest in this question.* For some years the "equal suf-

HON. JOSEPH H. CHOATE.

frage" societies have been waging a campaign of discussion in many towns and villages of western New York, but the movement in New York city and Brooklyn seems for the most part to be in the hands of ardent recruits who have joined the ranks since last fall's election. It is exceedingly difficult to ascertain the extent of the sentiment for political enfranchisement among the women of the State. The suffragists promise to present to the convention a petition bearing many hundred thousands of signatures. But those who are accustomed to note the signs that mark really deep and irresistible popular movements do not consider this demand for the enfranchisement of women in New York as possessing more than very limited support. It has, however, so enthusiastic and bright a constituency that it has compelled the attention of the press and pulpit, and will unquestionably secure a respectful and full hearing in the

convention. Doubtless the suffragists consider the present moment an opportune one for an educational campaign; but they can hardly expect to carry their point in a convention nine-tenths of whose members are said to be adverse to the idea of woman suffrage.

*The Liquor
Problem in
Several States.*

The decision of the Supreme Court of South Carolina, which annuls as unconstitutional Governor Tillman's system of State dispensaries for the sale of liquors, leaves in force that part of the law which forbids the granting of licenses to private individuals. The consequence is that South Carolina unexpectedly finds itself under a *régime* of absolute liquor prohibition. Inasmuch, however, as there can practically be little effective enforcement of prohibition without the strong sentiment of localities, it is not to be expected that the traffic will totally disappear. It would seem

GEN. NEAL DOW, OF MAINE.

probable that Governor Tillman's experiment in any case will have resulted in the permanent abolition in South Carolina of ordinary saloons,—that is, of places where liquor is sold to be drunk on the premises. While South Carolina's dispensary system has been overthrown, several other States, notably Massachusetts, have begun to consider with growing favor the adoption of some plan which shall take the motive of private gain away from the business of liquor selling. It is not improbable that we shall see the Norwegian system adopted in several American Commonwealths in the early future. The full text of the new Iowa liquor law has reached us since our remarks last month. It is not an easy law to understand. Nothing could be much more absurd than the insertion, in the middle of a law expressly and elaborately providing a system of liquor licensing, of a clause declaring that the purpose of the present act is not to legalize the selling of liquors. It appears that under this act municipal governments are authorized to make the license fee higher than the prescribed \$600 if they so desire. Des Moines has now passed a municipal ordinance fixing the fee at one thousand dollars a year for each saloon, this being the sum which for a number of years has been successfully levied upon saloons in the larger towns of several adjacent States. We are informed that Davenport, Dubuque,

Clinton, Burlington, and other large towns have not yet recognized the new law;—that is to say, the business of liquor selling goes on just as it did before, and these cities pay no more attention to the statute which permits the licensing of saloons under certain conditions, than they paid to the old law which prohibited the existence of drinking places under any conditions whatsoever. South Carolina is not the only Southern State in which the liquor question is under agitation. A campaign is in progress in Tennessee for the enactment of a law similar to that which has already been adopted in Mississippi. This law makes it necessary for the renewal of every saloon license that a majority of the citizens of the district where the saloon is situated should sign a petition addressed to the county authorities favoring the granting of a permit for another year.

*A Coming
Temperance
Congress.*

All friends of temperance ought to be interested in the international temperance congress that has been called to meet on Staten Island in New York Bay on the 3d, 4th and

MAJOR-GENERAL O. O. HOWARD.

5th days of June. It is to take the form of a reception and demonstration in honor of General Neal Dow, who has completed his ninetieth year, as this magazine has already announced. General Dow has been prominently identified with temperance work during practically the entire history of the temperance reform movement in this country, and it is fitting that the friends of the reform should show him the highest respect and should offer him their united congratulations. Apart from this plan of a reception to General Dow, the practical object of the congress will be "to formulate a plan for the union of temperance forces in one grand aim." That this announcement is made in good faith and that there is a prospect of progress in this desirable direction is made evident by the following names attached to the call for the congress, these leaders also constituting the committee of arrangements: Joseph A. Bogardus, President of the American Temperance Union; Major-General O. O. Howard, President of the National Temperance Society; D. H. Mann, M.D., Right Worthy Grand Chief Templar of the World; James M. Buckley, D.D., editor of the *New York Christian Advocate*; H. K. Carroll, D.D., of the editorial staff of the *New York Independent*; William T. Wardwell, Treasurer of the Standard Oil Company; James H. Darlington, D.D., Christ's Church, Brooklyn, N. Y.; Mrs. Mary T. Burt, President of the W. C. T. U. of the State of New York; D. S. Gregory, D.D., Ex-President of the Lake Forest University; George R. Scott, of the *New York Witness*; Col. Alexander S. Bacon, President of the Brooklyn Sunday Observance Society; Robert Graham, Secretary of the Church Temperance Society, and Charles H. Parkhurst, D.D., President of the Society for the Prevention of Crime, of New York City. General Howard will preside over the congress, and General Dow of course will be present. This congress will be something very different from a convention of the Third Party Prohibitionists, and the presence of delegates from all parts of the country and from Canada ought to secure reports and discussions which will throw very valuable light upon the actual condition of the temperance movement, and also upon the methods which would seem most likely to be efficacious under existing circumstances. It is worth while to note the fact that there are evidences in many localities of a growing willingness on the part of the political Prohibitionists to join hands with other temperance workers in practicable measures for diminishing the evils of the liquor traffic and the undue use of alcoholic beverages. Thus in Massachusetts many prominent Prohibitionists are identifying themselves with the movement for the introduction of the Norwegian system, while in the Tennessee campaign and in other portions of the country one finds out-and-out Prohibitionists working in favor of measures of restriction which come far short of the ideal towards which they are aiming. When the Third Party Prohibitionists will agree that half a loaf is better than no bread it will be a brighter day for temperance reform in this country.

*Marrying in
Royal Circles.*

Last month witnessed a royal marriage and an imperial betrothal. The marriage at Coburg of the Duke of Coburg's daughter with the son of the Grand Duke of Hesse is a matter of no political importance, although the presence of numerous royalties made it an affair of high social interest. But the betrothal of the Czarevitch to the daughter of the Duke of Hesse, granddaughter of Her Majesty the Queen of England, may

THE CZAREVITCH.

prove of supreme concern. No one knows much about the Czarevitch. Rumor has been busy with his name in a manner that has not been complimentary either to his character or to his resolution. It was reported that the Czar was contemplating a change in the order of succession in consequence of what was said to be a manifest unfitness of the Czarevitch to undertake the responsibilities of the Empire. Rumor is usually a lying jade, and in this case there is no reason to think that she has been suddenly reformed. The Czarevitch's marriage, which is to come off before long, is popular in Russia, where there was some fear that he might have married a Prussian. His betrothed is regarded more as an English princess than as a German, and in any case the projected marriage is hailed with approval both as extricating the Czarevitch from the temptations of his position, and securing the succession to the Imperial throne.

*Sir William
Harcourt's
Budget.*

The approach of the general election dominates everything in England. The budget which was introduced in April is an electioneering budget. All the measures which ministers are introducing are made for show with a view to the hustings. The work of replenishing a shop window before the general clearing sale comes on is well understood on both sides. Ministers on the whole have been successful in their work. The budget which they feared has met with unexpected approval. It is very simple. The Chancellor of the Exchequer in the coming year, if he had made no changes, would have received about ninety-one million pounds, and would have spent ninety-five and a half millions, leaving a deficit of four and a half millions to be met somehow. The following is the method by which he proposes to choke the deficit :

Suspending the New Sinking Fund.....	£2,123,000
New Death Duties.....	1,000,000
Increased Beer and Spirit Duties.....	1,340,000
Additional Penny on Income Tax....	£1,780,000
Deduct Abatements.....	1,450,000
	<hr/> 330,000
Total.....	£4,793,000

The increase on the drink duties is due to an extra sixpence a barrel on beer, and sixpence a gallon on spirits.

*England's
New Taxa-
tion.*

The new abatements on the income tax, which take away four-fifths of the increase due to the additional penny, are simple. At present no one pays whose salary is under £150 a year. This just hits those who earn £3 a week, therefore the exemption is raised to £160. All who earn incomes under £400 may deduct £160 to get at the sum on which they have to pay the tax; and a person who receives £500 a year knocks off £100. These abatements were devised to make the increased penny on the pound less unpalatable than it is at present. The brewers and distillers are up in arms—naturally, but to no purpose. No objection has been raised to the amended income tax, and very little to the suspension of the sinking fund. The real fight will be over the alteration of the “death duties.” The changes in the death duties are two. First, the Government have adopted the system of graduation, by which the amount paid is increased in proportion to the amount left. Any man who dies worth a million sterling will pay eight per cent., whereas a man who leaves £500 pays only one per cent. The graduation does not go above a million. Multi-millionaires do not pay at a higher rate than millionaires. It is difficult to understand why the principle of graduation should not be enforced above the million level as well as below it. The succession duties are, in future, to be paid on all kinds of property. The point around which the fight will be fierce is the equalization of the duties paid upon land and upon personalty. The landed interest, which at the present moment is in by no means a flourishing condition, will make a great fight on this point. They maintain, not unreason-

SIR W. HARCOURT INTRODUCING HIS BUDGET.

ably, that if they are to pay equal death duties, plutocrats who do not own land should pay rates on their personal property. It is very difficult to levy rates on personal property. The efforts which have been made in that direction in America have by no means succeeded. But it is well to remember that the landlord as a rule, even when he is a bad landlord, contributes much more largely from his rent to the social necessities of his neighbors and his employees than the owner of stocks and bonds. The popular superstition that a landed proprietor must necessarily be a rich man dies hard in England. At present nothing could be further from the truth, unless the landed proprietor happens to own ground-rents in a growing city. The belief is a survival of the time when all property was landed property. It is a ridiculous anachronism to-day, when the richest men do not possess land, and escape lightly from the social and legal obligations that weigh so heavily upon the owner of great landed estates.

*The
Registration
Bill.*

The Registration bill has met with considerable approval, and it is possible that it may get through the House of Commons in time to be rejected by the House of Lords. The bill is simple. It reduces the period of residence necessary to qualify for a vote to three months. It abolishes the right at present enjoyed by citizens who have qualifications in different constituencies of voting in each of them. It declares that all elections shall take place on one day, and that day shall be Saturday. Registers are to be made up twice a year instead of once, and a man is to be a qualified elector even if the rates are not paid on the qualifying premises. The Conservatives, it is understood, will not seriously oppose the bill excepting so far as to obstruct it in detail, and then to protest against disturbing the electoral settlement by introducing the principle of "One Man One Vote" unless accompanied by the provision to give one vote one value. In other words, the Registration bill will be hung up until it is accompanied by redistribution, which will take away the excess of seats at present enjoyed by the Irish. As this will be held to be equivalent to the rejection of the bill, the Liberals will go to the country with a fresh cry against the House of Lords.

*The Evicted
Tenants Bill.*

The Evicted Tenants bill, which Mr. Morley introduced, is intended to clear up a trouble which was left over from the previous Administration. The Plan-of-Campaign tenants who were evicted have never ceased to demand that they should be reinstated. The bill proposed to reinstate them, on condition that the tenants who have been planted on their holdings shall be bought out. If they refuse, the evicted tenant must remain in his present forlorn condition. If, however, they consent to give up the holdings, which, according to popular sentiment, they should never have grabbed, there will be compensation for disturbance, at a rate

which is to be fixed by three arbitrators, who are to be appointed by the Government. One-half the money will have to be provided by the incoming tenant, the other half by the court, which will have the sum of £100,000 at its disposal, taken from the fast dwindling surplus of the Irish Church Fund. In the case of a derelict farm from which the tenant has been evicted, but which has not been occupied by any other tenant, the evicted is to be reinstated by the Commissioners on application, unless the landlord objects. In case the landlord objects, the objection will be overruled if the Commissioners on hearing the case decide that it is unreasonable. The Irish members accepted the proposal, Mr. Sexton stating that there were only one hundred evicted tenants who were face to face with the landgrabbers in their old holdings.

*Welsh
Disestablish-
ment.*

The Welsh Disestablishment bill is one of those measures which create an amount of friction altogether out of proportion to their intrinsic merits. The bill disestablishes and disendows the Welsh Church. It creates no Church fund, but transfers the parochial endowment to the local authorities. The existing incumbents are to draw their stipends until they die. Curates, however, are not to be compensated. The cathedrals and certain other church edifices are to be nationalized. The authorities are to permit the use of these edifices for religious worship to the disestablished church. The Welsh churches and parsonages are gifted to the disestablished sect. Private patrons are to have one year's value of their livings given them as compensation. When the bishops die off, their incomes will be disposed of for public purposes, such as the endowment of a museum or an academy. The tithes now paid to the clergy will practically go in relief of taxes. It may be inevitable, but it is melancholy to see the funds set apart to altruistic uses frittered away in this fashion. The question, however, is not urgent, for nothing will be done till after next election.

*The Scotch
Grand
Committee.*

The Irish and the Welsh having had their turn, the Scotch who are at present governing the Empire have been allowed to settle Scotch bills in a Scotch Grand Committee, to which fifteen Unionists from the other parts of the Kingdom are added to keep up appearances. This innocent and altogether unobjectionable method of utilizing the Scotch members by allowing them to do their own business by themselves at Westminster, instead of compelling them to block the House of Commons with debates which no one attends but themselves, met with an absurd amount of opposition, Mr. Chamberlain leading the van. The principle of devolution, *viâ* National Committees, has been recognized, and as it is the first step that counts, we may expect to see it logically applied to the other nationalities. The objection of the Liberals to an English Grand Committee was untenable, and before the century closes we shall see English, Scotch,

Irish, and Welsh business referred to as many National Committees. As a matter of course, every one will marvel why such an obviously sensible arrangement was not adopted long before.

*The Eight-Hours
Day in
Parliament.*

The Miners' Eight-Hours bill, supported by a Government five-line "whip," and voted for by almost all Ministers excepting Mr. Morley and Mr. Burt, was read a second time by 281 to 194, an increase of 10 on the division of 1893. The opposition of the coal owners, led by such men as Sir J. W. Pease and Mr. Thomas, is ominous. The eight-hour system when tried in South Wales was abandoned by most of the miners, and it is strongly opposed in the north of England, where the miners are much more intelligent and disciplined than in the Midlands. It would seem, however, in this, as in local option, that the experiment will have to be tried with all its risks before the advocates of the new panacea will be satisfied that they are on a wrong tack. All that can be done is to see both that there is as much elasticity as possible introduced into the new regulations, and that the way is left open for retracing steps should the experiment prove unsuccessful.

*The Living
Wage.*

When the miners and their employers met at the Board of Conciliation to settle the question of wages, left over from the disastrous strike of last year, Lord Shand, the chairman, refused to allow the right to a living wage to be placed among the rules of the Board. Thereupon, Mr. Bailey, a miners' agent from Nottingham, denounced Lord Shand as a biassed and prejudiced party, and threatened to do what he could to renew the strike rather than sacrifice that cherished phrase. It would be interesting to find out how many millions that phrase cost England. That there is nothing in it but a phrase, Mr. Burt aptly pointed out last month at Durham. He said:

The minimum wage was a mere phrase. The living wage was impossible to define. It was well to hold it up as an ideal, it was proper enough to discuss and to debate it; but what they practically found when they came to deal with that question was that if the nominal wage were maintained, great numbers of men were thrown out of employment altogether, great numbers of others were working half time, and although the nominal daily wage might be maintained at its old rate, the weekly wage or the monthly wage might become exceedingly little indeed.

Nothing can be more obvious, but nothing was more passionately denied by those well-meaning people who kept the strike going by their sympathy and their subscriptions long after it might have been ended by reference to arbitration.

*The Report of
the Labor
Commission.*

The Royal Commission on Labor has drawn up an elaborate report which is chiefly notable because of the moderate nature of the suggestions which emanate from the great majority of the Commissioners. The Commis-

sion sat three years, examined five hundred and eighty-three witnesses, issued sixty-five Blue Books, and recommended an irreducible minimum of permissive and administrative improvements. Briefly stated, their recommendations were as follows:

1. Voluntary Board of Conciliation and Arbitration.
2. A stronger Labor Departmental Board of Trade.
3. An Inquiry into the State as Employer.
4. No overtime for minors in dressmakers and other trades.
5. Laundries to come under Factory acts.
6. Legalization of peaceful picketing.
7. Certificates of fitness to be required from owners of all workshops, bakehouses, etc.
8. Sailors' wives to draw half their husbands' pay fortnightly.
9. Advances of money by State to build laborers' cottages.

All these recommendations were unanimously approved by the Commissioners, and taken together they constitute a valuable though moderate permanent reform.

*The Minority
Report.*

The minority report signed by Tom Mann, Michael Austin, and James Maudsley, is a much more drastic and thoroughgoing manifesto. These typical and representative workmen recommend, among other things, the following reforms:—

(a) The explicit and widely advertised adoption by the Government and all local authorities of direct public employment, whenever this is advantageous, the eight-hour day, trade union conditions, and a moral minimum wage.

(b) The extension of the Factory and similar acts to all manual workers in all trades, and their drastic enforcement in such a way as to discourage home work, and absolutely to prohibit industrial oppression.

(c) The securing by appropriate law of an eight-hour day for every manual worker.

(d) The thorough investigation and bold experimental treatment of the problem of the unemployed.

(e) The provision of adequate sanitary housing accommodation for the whole nation; as well as honorable maintenance for all its workers in their old age.

There is a fine ring about these phrases that is more French than English, and it only needs the addition of a sixth resolution—viz.—

(f) The establishment of the millennium without a moment's unnecessary delay throughout the whole world.

To which also we would all subscribe with both hands. We may not exactly know how it is to be effected, but they do not labor in vain who build castles in the air. They will materialize up into reality by and by.

*A Peaceful
May Day
in Europe.*

May Day found the Continent in comparative rest; for the tranquillity of Europe can hardly be said to be affected by a strike at Vienna. Labor Day is no longer regarded with alarm. There is plenty of unrest, both political and social, but it smolders, finding expression in the occasional bursting of an anarchist bomb, a Ministerial crisis in a small State, and more or less despairing efforts to choke deficits in treasuries, ex-

hausted by the incessant demands of the ministers of war. The only ripple that has disturbed the surface of affairs in Europe has been due to Egypt and Samoa. At Cairo, Riaz Pasha has disappeared, and the evergreen Nubar is once more Prime Minister. The change was effected without disturbance, and met with general approval. A proposal made by New Zealand that the Island Kingdom of Samoa should be administered by the British Colony in place of being as at present under a joint tutelage of America, England, and Germany, has elicited protests from the official press at Berlin. The international congress of coal miners later in May served chiefly to show how different is the continental point of view, with its strong socialistic ideals, from that of the English trades-unionists.

The British Retention of Uganda.

Lord Rosebery, speaking at the City Liberal Club, said that he thought he might safely say that, without boasting

or claiming too much, so far as Her Majesty's advisers are concerned, the Liberal party can at least guarantee that they would not lower the flag of the country abroad. By way of emphasizing this guarantee, Her Majesty had determined to establish a regular administration in Uganda under British protectorate. Although this was a foregone conclusion after Sir Gerald Portal's report and the action which Lord Rosebery had taken when he was at the Foreign Office, there is a general feeling of satisfaction that the question is settled. Another advance post has been taken up on the long line of stations which will ultimately connect Cairo with the Cape. Uganda is not to be annexed, but administered by British officials acting nominally as advisers of the native King. It is, in short, to be Egypt over again, with British preponderance a little accentuated. It is an inclement month when no enlargement of the British Empire can be announced.

Some Instances of Longevity.

The longevity of men who have given good service in their generation to the country and to their respective communities, is always a source of gratification. Thus the whole world of moral and social reform has found sincere pleasure in the survival, to the great age of ninety years, of the intrepid Prohibitionist who created the Maine law. Boston has of late been rejoicing in the attainment by her distinguished citizen Robert C. Winthrop of his eighty-fifth year. Winthrop is a lineal descendant of the first Governor of the

SIR GEO. O. TREVELYAN ADVOCATING THE SCOTCH GRAND COMMITTEE.

Massachusetts colony, and has filled various positions of honor and trust. He studied law with Daniel Webster, and sixty years ago was in the Massachusetts legislature. Afterwards for five successive terms he served in the House of Representatives at Washington, and when Daniel Webster became Secretary of State in 1850, Mr. Winthrop took his place in the United States Senate. He occupied the Senatorial chair until he was succeeded by Charles Sumner. The eighty-fifth birthday of this representative New Englander and brilliant orator was celebrated in South Carolina by the laying of the corner stone of a new normal and industrial college which is to bear Mr. Winthrop's name. From Kentucky comes the reminder that Cassius M. Clay is eighty-four years old. Speaking of longevity, General Dow must feel himself a comparatively young man in view of the fact that his fellow citizen Captain Saul C. Higgins, of the town of Gorham, Maine, has just completed his one hundredth year in the midst of the congratulations of hosts of friends and neighbors. It is to be hoped that when General Dow rounds out his full century, Captain Saul C. Higgins may still be in flourishing health with his lead of ten years. Centenarians are henceforth not to be so rare. The laws of health are better understood to-day than ever before, and the great advances in medical, surgical, and sanitary science must inevitably result not only in

HON. ROBERT C. WINTHROP.

CAPT. HIGGINS, AGED ONE HUNDRED.

the marked average prolongation of life, but also in the preservation to a very great age of an increasing number of those whose natural chances of long life are exceptionally good.

During the week from the 6th to the 13th of May there was celebrated in Brooklyn the twenty-fifth anniversary of the Rev. Dr. Talmage's pastorate in that city. The Mayor of Brooklyn and a host of prominent laymen and clergymen assembled on May 11 to do honor to the eloquent pastor of the Tabernacle. Two days later, on Sunday, May 13, soon after the conclusion of the morning service, a fire broke out among the organ pipes, in consequence as is supposed of a defect in the insulation of an electric wire. The great building was soon reduced to ruins. Thus for the third time during the period of his pastoral incumbency Dr. Talmage's Brooklyn congregation has had its church building destroyed. This last "Tabernacle" is said to have been the largest Protestant church edifice in America. It had cost some four hundred thousand dollars and was heavily mortgaged. The financial straits of his church have long made difficult Dr. Talmage's position in Brooklyn. Much criticism some months ago was evoked by a settlement of most of the outstanding claims against the church on a basis of less than twenty-five cents to the

*Dr. Talmage
and the
Brooklyn Tabernacle.*

REV. T. DE WITT TALMAGE, D.D.

dollar. It would certainly seem as if there could never be any satisfaction in preaching or worshipping under the roof of a magnificent structure against which so bad a financial record as this could be alleged. It could always have been said with regard to it that the men who furnished the honest labor and materials to build this great church were finally obliged to accept twenty three cents for every dollar that was due them, after a long period of waiting. The establishment might have outlived this aspersion, but it does not seem likely that the record would ever have been forgotten. Dr. Talmage was just upon the point of starting for a tour around the world when the fire occurred, and the mishap did not delay his going. He left behind him the announcement that if a sum sufficient for the construction of a new

building were put into a bank before any work was begun, he would consent to remain as pastor of the Brooklyn Tabernacle. It is possible that such a condition may be fulfilled, but extremely improbable. Fortunately the coming of the Kingdom of Heaven is not dependent upon the construction of splendid tabernacles, whether mortgaged or otherwise; and Dr. Talmage of course will have ample opportunity to make himself heard regardless of the fate of the Brooklyn Central Presbyterian Church.

*In the
College
World.*

The approach of commencement week brings interesting news from universities and colleges throughout the country. In general, although the financial depression of the past

year slightly affected the attendance of students, it has been a year of marked progress and prosperity in educational fields. The twenty-fifth year of President Eliot's administration at Harvard has been made the occasion of much comment upon the advances our higher institutions of learning have made since 1870. From the University of Pennsylvania comes the announcement of Dr. Pepper's retirement from the provostship. Dr. Pepper has accomplished a magnificent work for the development of his institution, and will still retain his connection with the medical department. The demands of a profession in which he holds so eminent a place have made it necessary for him to lay down the task of general administration. Fortunately his successor was ready at hand in the person of Mr. Charles C. Harrison, who has long been one of the most active members of the board of trustees. Among other developing departments of the University of Pennsylvania, the Wharton School of Finance has by virtue of new endowments entered upon an enlarged career that deserves prominent mention in the educational history of the current year. The topic is one that the REVIEW will have further occasion to discuss. The demolition of the old University building on Washington Square in New York, affords the latest visible evidence of the uptown tendency of the higher education. The University of New York under Dr. McCracken's chancellorship has followed the example of Columbia College under the presidency of Dr. Seth Low, in securing spacious new grounds far north of the crowded heart of the metropolis. The College for the Training of Teachers, now a virtual part of Columbia, has also made its permanent home on the lofty ground beyond Central Park, and its handsome new building is nearly completed. The institutions for the education of women have made a record of general progress during the past year. Among other things worth mentioning, the so-called "Harvard Annex" has been metamorphosed into Radcliffe College, which, while not organically a part of Harvard University, will be

DR. WILLIAM PEPPER, OF PHILADELPHIA.

so intimately connected with the University as to give its young women students advantages almost identical with those offered at Cambridge to young men. Barnard College in New York bears a similar relation to Columbia; and this promising school for women hopes at an early day to construct its permanent abiding place upon a site contiguous to the new Columbia grounds. Barnard has secured for its dean-ship Miss Emily James Smith, who has made a high record as a scholar in several institutions, and is now about to receive the degree of Ph.D. from the Chicago University, where she holds a classical fellowship.

DR. TALMAGE'S CHURCH, DESTROYED BY FIRE MAY 13.

CURRENT HISTORY IN CARICATURE.

PUZZLE.

Find the two lovers.—From *Life* (New York).

IN earlier numbers we have printed brief sketches of *Puck* and *Judge*, who have been such constant contributors to this department. Their particular mission is, of course, in the political field, but the social and literary happenings and celebrities are just as truly a part of our history as are the political, and in this lighter atmosphere of gayety and caricature, *Life* is the undisputed leader.

Life is such an institution with us to-day that it is hard to realize that it began a struggling and discouraged existence only a dozen years ago. Mr. I. A. Mitchell, a successful young illustrator of New York city, conceived the idea of the paper in that very casual way in which the most fertile ideas do come to be conceived, and when his whole circle of friends and some newly acquired acquaintances had proven to him that it was, beyond a peradventure, impossible,—he promptly went ahead and did it, having gathered unto himself two kindred undismayed spirits in Mr. Andrew Miller, business manager, and Mr. E. S. Martin, literary editor. For several months the infinite returns of unsold copies more than justified all doleful prophecies. But the three plucky young men kept at it

and flings have been uniformly directed against the social and literary and political absurdities that should be fair game for satire. Thus, in the fields of social vulnerability, Mr. Chas. D. Gibson's drawings—of late years rather the most prominent and distinctive in *Life*—have been enlisted in holding up to ridicule the snobbishness which is everywhere, but in some places more than in others: in depicting the tragic or absurd

night and day; presently when eight or nine months old, there came a day when *Life* could walk alone, financially speaking, and from that it was not long in learning to run smoothly and profitably.

Mr. Mitchell's original conception was to give in the jaunty little weekly, pictures of life and character which should be instinct with human interest. While *Life* entirely agrees with the famous French wit who thought gravity "a mysterious carriage of the body to conceal certain defects of the mind," it is far from being an irresponsible clown; while its privileges of jester have given it a freer range and a more telling stroke, its sallies have not been malicious nor unconsidered. In fact, its more bitter quips

HORIATI'S CLEVELAND.

Alone stood brave Horatius,
But constant still in mind ;
Thrice thirty thousand foes before,
And the broad flood behind.

"Down with him!" cried false Sextus,
With a smile on his pale face
"Now yield thee," cried Lars Porsena,
"Now yield thee to our grace."

From *Life* (New York).

BRAVO, DAVID! HIT HIM AGAIN!

It is hoped that this effective drama, with Dr. Parkhurst as David and the Metropolitan police as Goliath, will continue to hold the boards.—From *Life* (New York).

results of *mariages de convenance*, and especially of the tendency—most truly deplorable in the eyes of every male American—of our fairest sisters and daughters to succumb to the infatuations of jaded and titled Europeans.

In the literary lists *Life's* knight has for many months been the bright and trenchant "Droch," more elaborately and intimately known as Mr. Robert Bridges. Under the pretty title "Overheard in Arcady," he has hebdomadally brought together into conversation the men and women who live in the books of Kipling, James, Stevenson and birds of that feather,—one author being served up at a time

above all, at the vagaries of the wonderful creature known as society, at the rusty hinged coffers of the millionaire, at the omnibus line that finds old horses cheaper than oats, and at the cable car man who believes in Malthus—*Life* helps not a little to put our ridicule where it will do the most good.

Several of the weeklies, aside from the political cartoon papers, have a corner where the motive of "social satire" gives reason for the existence of a funny picture, and we show a specimen from *Harper's Weekly* in which the perennial subject of the college man and his pranks is exploited, while in a drawing from *Punch*, *Life's* venerable prototype across seas, the *fin de siècle* woman is cartooned along with her *fin de siècle* vanities of Ibsen, divided skirts and the suffrage.

But it is to Australasia this year that we must look for

GOOD ARCHITECTURE BE — !

Secretary Carlisle has decided that designs for government buildings shall be turned out by machinery as heretofore.—From *Life* (New York).

—with very felicitous and piquant results. His illustrators, Attwood, Herford and Charles Howard Johnson, have been especially true in their hits, as the examples which we reproduce will attest. The subtle force of the cartoon can be especially well appreciated in such bits showing Mr. Howells holding up a looking glass to Mr. World, the wise and blasé young Rudyard Kipling surrounded by his idols, Mr. Richard Harding Davis writing stories of New York life from a (Broadway) car window, and Mr. Henry James arranging with nice strokes on his canvas the subtle tints and *nuances* of character.

THE COLLEGE MAN OF TO-DAY.

"Oh, I say, governor, you ought to have been here last week! It was immense. We drowned the president of the Freshman class, and—tee-hee-hee!—two of us crawled into Professor Bluegoggle's room after he'd gone to bed and turned on every gas-jet in the room!"—From *Harper's Weekly*.

caricature touching woman's political enfranchisement. For the particular amusement of our women readers in New York, both suffragists and "antis," who need some diversion in the lulls of their heavy campaigning, we reproduce a number of cartoons that have lately contributed to the light-heartedness of the antipodeans. The New Zealand *Graphic* has published numerous clever cartoons upon the suffrage of women since the cause was won in that island, and the Sydney *Bulletin* has in like manner helped by its shafts to drive away the depression that followed defeat.

In the field of American political affairs the already much buffeted tariff bill bearing the West Virginia Senator's name is the object of the most pungent caricature. The opposition *Judge* shows a bicycle meet of the Democratic leaders taking successive "headers" of the most destructive character over the dangerous Wilson bill. A cartoon from our English cousins in the London *Moonshine* suggests an analogous subject in the picture of Sir William drubbing the prosperous Briton with his boxing gloves of the income tax while the income-less representative of the trades unions stands by and approves highly of the proceedings.

Both the Democratic *Puck* and the Republican *Judge* hit out savagely at the members of the former party that are in Tammany and Tammany methods. The first paper shows the at last impatient steed Maryland shaking off the burden of Senator Gorman, while in another picture the same journal makes a weather forecast of annihilating storms for the Tammany Hall district, representing the Tammany leaders and their abodes as being overwhelmed in the flood, while their feline Genius howls in horror on the roof of the Hall.

In Australasian caricature, aside from the numberless flings at the woman's suffrage question, which we have spoken of above, we reproduce a cartoon from the Sydney *Bulletin* giving an Australasian view of the House of Lords problem, and representing the Peers as a sulky cow standing on the railroad track in front of the advancing train of the Commons,

MR. STEVENSON—"TWO IN ONE."

MR. HOWELLS MIRRORING THE WORLD.

while the Queen and her son are in vain urging the unwise bovine to leave the path of destruction.

The naval expenditures give the subject for *Judy's* picture, where wealthy John Bull, seated at his office desk, is thrusting his hand into his pocket to pay for the naval improvements, but with a warning that the gold shall be spent on the navy, and not fall by the wayside.

The London *Fun* looks to the Continent and has a laugh at the queer though historic methods the royal gentry take there to insure peace; the lady who personifies *Pax* not illogically requesting the opposed powers to relieve themselves of their swordbelts in her presence, and they replying that their arms are really borne for her sake.

J. W. Bengough, the genius of the bright and keen Canadian paper, *Grip*, seems to be able to achieve pathos and tenderness in his cartoons with the same truth and effectiveness that characterize his satirical drawings. In the pretty picture reproduced on another page he shows an attractively study figure of Mr. Gladstone attended with loving admiration by the two girl figures representing the Liberal and Conservative.

From the *Weekly Freeman* (Dublin).

RECORD OF CURRENT EVENTS

April 21.—It is estimated that 130,000 bituminous coal miners stop work in obedience to the order of their national organization; the strike is for a restoration of former rates of pay....Earthquake shocks in Greece cause great damage, especially at Thebes.

April 22.—Kelly's "Industrial Army" starts to cross Iowa from Council Bluffs on its march to Washington.... Steamer *Los Angeles* wrecked near Monterey, California; six lives lost....First Sunday art exhibition held in London.

April 23.—Commissioners of the District of Columbia issue a proclamation of warning to Coxeyites....The striking coal miners receive many accessions to their ranks.

April 24.—The Illinois Attorney-General begins *quo warranto* proceedings against the Chicago Gas Trust.... The American Arctic expedition under the command of Walter Wellman sails from Norway....One hundred new cases of cholera and three deaths in Lisbon....Terrific gale on the southern coast of Ireland.

April 25.—At Billings, Montana, U. S. deputy marshals attempt unsuccessfully to recapture a train taken the day before at Butte by 500 members of Hogan's "Industrial Army;" shots are exchanged and two men are wounded....Secretary Herbert reduces the sentences of Commander Heyerman and Lieutenant Lyman, found responsible for the *Kearsarge* disaster; both officers are suspended from duty for one year, with loss of rank for that period, and replaced on waiting orders pay.

April 26.—Nearly all the plants in the Pennsylvania coke region are closed on account of the miners' strike.... A bill is introduced in the British House of Commons for the disestablishment of the Church in Wales.

April 27.—The New York Legislature adjourns, after passing many reform bills; Governor Flower vetoes the blanket ballot bill and later the bill giving the mayor of New York City the power of removal of heads of departments and the bi-partisan police bills for New York and other cities; he approves the compulsory education bill, several anti-Tammany measures and a bill for the preservation of the City Hall....Another earthquake shock in Greece; it is officially stated that this, together with the previous shocks, caused the death of 400 persons and rendered 20,000 homeless and destitute....Admiral Da Gama and 252 of his men are rescued from a Portuguese transport....The Peruvian insurgent, Solar, appoints a Cabinet; Borgono's government forms a fresh army corps....Cholera prevails in East Galicia, at Koons in Russia, and in the Department of Finisterre, France....The British House of Commons adopts a resolution to appoint a committee of 87 members, of whom 72 are Scotchmen, to consider Scottish measures.

April 28.—Galvin's division of Coxeyites is arrested at Mt. Sterling, Ohio, for "holding up" a B. and O. train; U. S. troops ordered to assist civil authorities against similar lawlessness in the Far West....Earthquake destroys Venezuelan towns, with great loss of life....Emile Henry, the Paris anarchist, is found guilty of bomb throwing and sentenced to death....Don Carlos, pretender to the throne of Spain, marries the Princess Marie Berthe de Rohan.

April 29.—The St. Charles Hotel, New Orleans, is destroyed by fire, at a loss of \$500,000; one man killed and several employees missing....President Peixoto's fleet captures Paranagua, the last of the Brazilian insurgent forts making no resistance....The Lyons (France) Exhibition of Arts, Sciences and Industries is opened.

April 30.—Rebellion in the Republic of Salvador, Central America....Fifty persons drowned by the collapse of

SENATOR PATTON, OF MICHIGAN.

a pier at Briola, a Roumanian town on the Danube.... Four lives lost and \$500,000 damage done to property by a landslide on the St. Anne River, near Quebec....Bombs are exploded in two Italian cities.

May 1.—Coxey's "Army of the Commonwealth" enters Washington and parades on Pennsylvania Avenue; the leader is not permitted to speak on the Capitol steps; his lieutenants, Browne and Jones, and later Coxey himself, are arrested for disorderly conduct and trespass; the "army" goes into camp in the city....Indiana municipal elections result generally in decided Republican victories....Great damage to crops in Texas by a storm; many houses demolished by wind in Arkansas....The Great Northern Railway strike, involving 5,000 employees on 3,700 miles of road in the Northwest, is declared off, President Hill conceding the restoration of wages to the old schedule as a result of arbitration....May Day celebrations are held in many European cities; although many

meetings are dispersed, no serious disturbances are reported.

May 2.—Conflicts between the police and riotous mobs in Cleveland, Ohio; the local militia are called from their armory....Delegates are elected to the Hawaiian constitutional convention; a majority favor annexation to the United States....The town of Stephany, Volhynia, Rus-

THE CZAREVITCH AND PRINCE GEORGE.

sia, is burned to the ground; fifteen persons are killed and many are reported as starving....The International Bimetallic Conference begins its sessions at London.

May 3.—Striking miners on the Mesaba Iron Range, Minn., threaten to destroy the property of the company, and a regiment of militia is sent to the scene....Lord Salisbury, speaking at Trowbridge, denounces the Irish in America as England's most bitter enemies.

May 4.—Ten men are shot and two company officials brutally assaulted in a conflict with strikers in the coke region....Iron miners on the Mesaba Range, Minn., return to work under protection of the troops....Premier Crispi in the Italian Chamber of Deputies defends the Triple Alliance and favors the preservation of the Austrian Empire....Two Italian anarchists are sentenced in London, one for twenty years and the other for ten.

May 5.—Governor Rich, of Michigan, appoints John Patton, Jr., U. S. Senator to succeed the late F. B. Stockbridge....A decision is rendered against ex-King Milan declaring the recent royal ukase illegal....King Leopold opens the Antwerp Exposition.

May 6.—Premier Crispi is the object of a hostile demonstration on his arrival in Milan to attend the opening of

the exhibition in that city....London workingmen hold their annual demonstration in Hyde Park and pass resolutions in favor of an eight-hour law.

May 7.—The latest amendments to the Senate tariff bill, about 400 in number, are made public....The Brazilian Congress opens, with President-elect Moraes in the chair; President Peixoto states that the insurrection has been crushed....The seven tourists imprisoned in a stalactite cave at Lugloch, Austria, since April 27 are rescued alive....A Jew baiting riot takes place at Grajewo, Poland, in which 16 persons are killed and about 100 injured.

May 8.—The New York Constitutional Convention is organized at Albany by the election of Joseph H. Choate, the eminent lawyer, as president....Coxey and Browne are found guilty of trespassing on the Capitol grounds....The Governor of the Chickasaw Nation is arrested on a charge of appropriating \$75,000, and a Supreme Court Justice is removed for malfeasance in office....Sportsmen from the United States are arrested on Lake Erie by the Canadian patrol boat *Petrel* on the charge of violating Canadian fishing laws....The French Ministry declares its intention to prosecute a Socialist Deputy.

May 9.—Trains are stolen by bands of Coxeyites in Colorado and Pennsylvania; in the latter State the train stealers are sent to jail for twenty days....Coke strikers attack workers at a plant and badly beat several of them....Nine striking miners are killed and twenty wounded in battle with the police in Austrian Silesia.

May 10.—The monument to the mother of Washington, at Fredericksburg, Va., is dedicated in the presence of the President, Vice-President and other prominent public officers....Richard Croker resigns as a member of the executive committee and as chairman of the finance committee of Tammany Hall; John McQuade, a favored contractor, is selected to take his place....Two deputy marshals and several citizens are shot in a conflict with a band of Coxeyites who had stolen a train at Yakima, Wash....A conference of coal operators is held at Pittsburgh....The U. S. torpedo boat *Cushing* completes the voyage from Chesapeake Bay to New York-Bay by the Delaware and Raritan rivers and canals....The British budget passes second reading in the House of Commons by a majority of fourteen....General Andre Avelino

MR. DAVID POWELL.
Governor of the Bank of England.

Caceres is elected President of Peru....The Hungarian House of Magnates rejects the Civil Marriage bill by a majority of twenty-one; this is a defeat of the Cabinet, and indirectly of the Pope and Emperor Francis Joseph. ... The Right Hon. H. H. Asquith, British Home Secretary, is married to Miss Margot Tennant, a famous London society belle.

May 11.—Two train-stealing Coxeyites are wounded and 120 captured at Yakima, Wash....The Pullman car shops at Pullman, Ill., are closed by a strike of the workmen for a restoration of the former wage schedule.

May 12.—Three hundred Salt Lake "Industrials" are jailed for train stealing ...Coxey's "army" is removed from Washington because of the unsanitary condition of

LORD JUSTICE BOWEN.

its camp; it occupies a site near the District line in Maryland....In a bloody battle near Santa Ana, Salvador, the government army defeats the rebels.

May 13.—Two trains are "held up" by "Industrials" in the far West; Coxeyites are fed by the public in many places....The Brooklyn Tabernacle is destroyed by fire for the third time in the history of Dr. Talmage's pastorate, the completion of the first quarter-century of which had just been celebrated; the Hotel Regent is also burned, the total loss amounting to over \$1,000,000 ... Mundella resigns his seat as President of the Board of Trade in the Rosebery cabinet.

May 14.—Senator Caffery is elected to the U. S. Senate for the long term by the Louisiana Legislature, thus becoming the first U. S. officer chosen to serve in the twentieth century....Brazil severs relations with Portugal....An International Congress of Miners opens at Berlin.

May 15.—A conference of coal operators with delegates of the United Mine Workers' Union is opened at Cleveland; the convention embraces 195 miners and 150 operators, Illinois being unrepresented....The Brooklyn handicap is won by "Dr. Rice"....An area of twelve acres is burned over in Boston, rendering hundreds of families homeless and destroying property to the value of \$500,-

000....The Brazilian Congress ratifies the severance of diplomatic relations with Portugal on the ground that Portugal ignored Brazil's demand for satisfaction on account of Portugal's granting an asylum to Brazilian rebels....A railroad accident in Salvador causes great loss of life.

May 16.—Disastrous floods in Minnesota and WisconsinThe Missouri Democratic Convention commits itself to free silver....Three thousand London cab-drivers strike against the owners' terms of hire....Portugal seeks England's aid in negotiations with Brazil.

May 17.—The Presbyterian General Assembly meets at Saratoga; Dr. S. G. Mutchmore, of Philadelphia, is chosen Moderator....Ten lives are lost and much property destroyed by tornadoes in Ohio....The houses of many Chinese laborers on California ranches are looted by Coxeyites....Judge J. K. Hines is nominated by the Populists for Governor of Georgia....The British Royal Commission makes its report on the World's Fair at Chicago.

May 18.—Fierce storms on Lake Michigan cause many wrecks and some loss of life....The Cleveland conference between coal miners and operators ends in failure to reach any agreement....Ex-Premier Whiteway, of Newfoundland, is mobbed.

May 19.—Coxeyites steal two Northern Pacific trains.The Presbyterian General Assembly takes steps looking toward formal union with the Southern Church....The International Congress of Miners at Berlin is closed.

May 20.—Heavy rains in Pennsylvania result in the most disastrous floods since 1889.

OBITUARY.

April 21.—Elbert Brinckerhoff Monroe, philanthropist.Robert Harris, vice-president of the Northern Pacific Railroad....Ex-Gov. J. W. Throckmorton, of Texas.... Ex-Gov. Wm. B. Daniels, of Idaho.

May 2.—Judge George Blow, of Norfolk, Va., a survivor of the Congress of the Texas Republic of 1841....Col. A. B. Steinberger, a diplomatic agent of the United States under President Grant.

May 3.—Judge Stephen G. Nash, once a well-known Boston lawyer....Dr. Sam. Houston, son of the Texas hero, a poet and newspaper writer.

May 5.—John Jay, of New York City, ex-Minister to Austria and grandson of the first Chief Justice of the United States.

May 6.—Judge J. W. Green Smith, of Staunton, Va.... Gen. Theophile Adrien Ferron, of the French army.

May 7.—Mrs. Frances Elizabeth Barrow, widely known by the pen-name of "Aunt Fanny"....Senator Leon Labbe, the Paris surgeon.

May 8.—Col. Joseph Moore, of Indianapolis, who constructed many of the pontoon bridges used by Sherman on his march to the sea....Jesse P. Farley, of Dubuque, Iowa, a prominent railroad investor.

THE LATE FRANK HATTON.

May 9—Gen. Matthew M. Trumbull, the Chicago magazine writer....Dr. Wm. Theodore Barnard, who built the first elevated railroad in Chicago.

May 10.—Representative R. F. Brattan, of Maryland.Abraham Garrison, of Pittsburg, who saw the trip of Fulton's first steamboat....Rev. John Hall, D.D., of Trenton, N. J....Count von Bismarck-Bohlen, ex-Adjutant-General of Germany....The Countess of Clarendon, wife of the fifth Earl of Clarendon....Mrs. Henry E. Krehbiel (*nee* Helen Osborne), writer of children's stories.

May 11.—Dr. Wm. B. Dobson, of Philadelphia, the oldest living graduate of Jefferson Medical College.

May 12.—Gen. Robert Porter Dechert, of PhiladelphiaThomas C. Latto, of Brooklyn, the Scottish poet....

John Trotter Lindsay-Bethune, the tenth Earl of Lindsay.

May 13.—Kurd von Schlözer, German diplomat, minister to the United States in 1871.

May 14.—Henry Morley, the English author....Ex-Gov. A. C. Hunt, of Colorado.

May 15.—Wm. Hayden Edwards, U. S. Consul-General at Berlin, one of the best-known officers in our foreign service....Sewell E. Jewell, of Haverhill, Mass., a Garrisonian abolitionist.

May 16.—Rev. Richard Morris, D.D., the English philologist....Judge Thomas S. Wilson, a pioneer of Dubuque, Iowa....Rev. Thomas Powers Field, D.D., of Amherst, Mass.

May 17.—Rev. Edward Bright, D.D., editor of the *Examiner*....Rev. J. Oramel Peck, D.D., prominent in the missionary work of the Methodist Episcopal Church....Hon. John Hearn, member of the Dominion House of Commons for Quebec West.

May 19.—Andrew J. Graham, author of the system of shorthand which bears his name....Rev. Wm. McMurray, D.D., D.C.L., Roman Catholic Archdeacon of Niagara....Col. W. N. Brainerd, of Chicago, a Californian pioneer....Dr. Elijah S. Elder, a prominent physician of Indianapolis.

May 20.—Edmund Yates, the London author and journalist.

FORTHCOMING EVENTS.

CONVENTIONS.

THE announcements of conventions and summer gatherings of 1894 given in our May number were, of course, incomplete. At the time of going to press the programmes of many of the meetings had not been prepared, and it was a matter of some difficulty even to ascertain the dates and places of important gatherings. Still it is believed that in all cases in which definite announcements were made a reasonable accuracy was attained. This month we add some information which for one reason or another was not included in the May article.

POLITICS.

The only strictly political gathering of national significance during the summer will be the seventh annual convention of the National Republican League, to meet at Denver June 26. The ratio of representation will be six delegates-at-large from each State and Territory, four from each Congressional district, and one from each college Republican club in the country. The attendance will undoubtedly be large.

TEMPERANCE MEETINGS.

An International Temperance Congress is to be held on Staten Island, June 3-5, at which a reception will be tendered to Gen. Neal Dow in honor of the completion of his ninetieth year. Joseph Cook, Dr. B. B. Tyler, General Howard, Mrs. Mary A. Livermore, T. V. Powderly and many other prominent speakers will participate in the exercises. The reasons for temperance agitation will be set forth by such exponents of reform as Dr. C. H. Parkhurst, Edward Everett Hale, Robert Graham, Commander Ballington Booth, of the Salvation Army, and the Hon. Geo. E. Foster, of Canada. Legislative measures against the liquor traffic will be discussed by several experts in this field, among whom Dr. E. R. L. Gould, of Johns Hopkins University, and Governor Tillman, of South Carolina, are sure to command close attention.

The National Temperance Society will hold its annual convention at Ocean Grove, August 1-5. General O. O. Howard will preside, and Col. G. W. Bain, Booker T. Washington, and others are announced in the list of speakers.

EDITORS.

That much-abused class, the country newspaper men of the United States, represented by the National Editorial Association, will hold a meeting at Asbury Park, N. J., July 2-6. Robert J. Burdette, Col. McClure, Bill Nye, and Joe Howard will help to entertain and instruct the fraternity.

"ASSEMBLIES" AND SUMMER SCHOOLS.

LONG ISLAND.

At Point of Woods, on Great South Beach, two hours from New York, an assembly on the Chautauqua plan will be held during July and August. An important feature will be the lectures of the Rev. Theodore F. Seward on plans to secure Christian unity.

PENNSYLVANIA.

What is known as the "Pennsylvania Chautauqua," at Mt. Gretna Park in the Cornwall Hills, offers unusual attractions during July. Bishop Vincent, Professor Bolles and other well-known lecturers will be present.

THE OXFORD SUMMER MEETING.

The REVIEW OF REVIEWS has frequently mentioned the valuable privileges opened to Englishmen during the summer months at the old university town. The meeting this year will begin July 27 and close August 24. There will be ten different departments or courses of lectures. Dr. S. R. Gardiner, the Rev. Hudson Shaw, and Mr. H. W. Rolfe are among the lecturers on history and literature. Dr. E. T. Devine, the American economist, will conduct a course in his department.

ANOTHER "EXTENSION SUMMER MEETING."

The REVIEW OF REVIEWS called attention last month to the announcements of the Philadelphia meeting. Word now comes from South Carolina that a similar school will be opened in the college buildings at Columbia, July 17, to continue one month.

SUMMER WORK AT THE UNIVERSITIES.

CHICAGO.

In our May number no mention was made of the University of Chicago, not because the work there was thought less worthy of notice than that of other institutions, but rather because it does not seem to belong properly in a category of summer schools. Under the peculiar organization of the University of Chicago, the summer quarter, beginning July 1, is exactly on a par with other divisions of the year in respect to the work done by professors and students. The courses offered are fully equivalent to those offered in either the fall, spring or winter quarter.

CALIFORNIA.

The State University, at Berkeley, offers courses in physics and chemistry, and announces that the laboratories are to be open during June and the first two weeks of July.

A Chemical Congress is to be held at San Francisco, under the auspices of the Mid-Winter Fair, with the co-operation of the University, June 7-9.

THE NATION'S NEW LIBRARY AT WASHINGTON.

BY THE EDITOR.

LAST year the capital of the United States was situated in Jackson Park, at Chicago. The White City was the centre of attention and the focus toward which millions of pilgrims were moving. There were ardent enthusiasts who declared themselves in favor of the perpetuation in marble and granite of the transient architecture of the World's Fair and of the removal thither of the nation's political capital. Washington and its architectural monuments were for the moment quite obscured. Hundreds of millions of dollars have been spent by the people of the United States for public buildings; and yet they learned for the first time last year, from the structures built to shelter a six months' Fair, how dazzlingly beautiful and how nobly majestic it is possible to render a great edifice when the artist-architect joins hands with the practical builder under the encouragement of the powers that command the public purse. It was hoped that the White City might be spared for a few years at least, in order that the object lesson should have its full effect. But alas! the voices that were lifted for the preservation of those wondrous structures shouted all in vain. One vandal fire followed another until nothing remained but a scene of wreck and desolation; and now the ruins have been sold for a song, to purchasers who must remove the *débris* in a few brief months.

Yet the object lesson will not be forgotten. The American people will not submit henceforth to public architecture of the kind that disfigures so many of our cities, and that is not without representation in Washington itself. Inasmuch as the national capital is not to be removed to Jackson Park, but is to remain for some time to come in the District of Columbia upon the Potomac river, the nation will be quite disposed to console itself for the evanescence of the White City by a renewed zeal for the beautifying of the city of Washington. The growing charm of the Federal district is universally admitted, and a wise investment from time to time in architectural and artistic skill may within the next quarter century produce results of a beauty and grandeur hardly yet conceived. The one great architectural achievement at Washington, as the whole world admits, is the national Capitol. Of late its dignity has been enhanced by the addition at its west front of a great marble terrace with grand stairways, the whole constituting an approach perhaps not equaled by any other building of modern times.

Well known as is the Capitol building with its lofty dome, the country as a whole has not yet quite realized

that there is now approaching completion a great companion piece of architecture on the high ground directly beyond the Capitol. The new Congressional Library building, which covers some four acres, does not of course pretend to rival in size or grandeur of outline the splendid classical edifice at either end of which the Houses of Congress sit, and in the centre of which the Supreme Court holds its sessions. But in architectural detail and in the costliness and beauty of its finish the Library building will be the

MR. AINSWORTH R. SPOFFORD.

gem of our national buildings. Its gilded dome is not a lofty one, because it was desired that the Capitol building should remain the unrivaled centrepiece about which all other architectural monuments should be held in subordination, and this was a wise decision. Each of these two great buildings on the Capitol Hill adds something to the impressiveness of the other. There is harmony in the general effect, and each maintains its entire individuality.

Other buildings in Washington have a certain dignity and impressiveness. The Treasury, in its severe plainness and solidity, seems to defy the hand of time.

THE LIBRARY BUILDING AS IT NEARS COMPLETION.

The building that shelters the State, War and Navy departments, from certain points of view, is a vast and commanding pile of granite, whose height and many window tiers break the monotony of the prevailing Washington type of low Grecian architecture. But the experienced traveler who is familiar, for example, with the public buildings that individually and collectively are the glory of the Ring-strasse in Vienna, would hitherto have found nothing in Washington to compel more than a passing glance, excepting the incomparable Capitol itself. It is therefore a source of just gratification that there should now be added to our group of national buildings one that will always stand as a thoroughly good example of modern architecture.

The architect of the Library building is Mr. Paul J. Pelz, whose design was selected several years ago from those submitted by a number of competing architects. Many subsequent modifications of the design have been made, but the credit is primarily and essentially due to Mr. Pelz. The construction of the building has been in charge of Gen. Thomas L. Casey, Chief of Engineers in the Army, and its practical superintendence has from the beginning been assigned to Mr. Bernard R. Green, an engineer of high ability. The external work is now almost completed, but some two years may yet elapse before the very elaborate interior finish and decoration are done, and the building finally turned over to Congress for the use of the Library. Six million dollars is the sum fixed by Congress for the cost of the structure, and it will be kept within that amount. New Hampshire granite is the material of the exterior, while marbles from every quarter of the globe are represented inside.

The Library of Congress now occupies quarters in the Capitol building. Its collection of books outgrew the shelving capacity of these quarters a dozen years ago, and the huge aggregation of printed matter has gone on accumulating at the rate of 25,000 or 30,000 volumes a year. The books are piled everywhere in heaps which would seem to indicate helpless and hopeless confusion. Basement vaults are stuffed with literary treasures, and nothing can now be done with the further increase except to secure some kind of temporary storage and wait for the new building.

In the midst of this seeming confusion there moves a quiet, dark-eyed, alert-visaged gentleman whose systematic mind and clear intelligence dominate what would otherwise be an overwhelming anarchy of books. Mr. Ainsworth R. Spofford is a public servant whom all Congressmen respect and honor. In denouncing the ruthlessness of the spoils system, and the scant recognition of real merit in our public service, we must always remember that there are notable exceptions. Mr. Spofford will next year celebrate the attainment of his three-score and ten years of life, and the completion of thirty years of continuous service as Chief of the Congressional Library. Although the new building may not be ready for general public use, it is quite certain that Mr. Spofford may also next year superintend the placing of at least half a million volumes upon the shelves of the new stack rooms. It was to his persistence and energy more than to the persuasions of any other man that Congress yielded when it finally determined to erect a separate and monumental structure for the housing of a national library. For some time it was expected that the immediate problem of a place for the unshelved books would be

solved by building an extension to the east side of the Capitol. Fortunately this short-sighted policy was abandoned. Mr. Spofford's counsels were largely followed in the planning of the new structure, and he is justified in pronouncing it incomparably the best arranged, as it is also the most commodious, national library structure of the whole world. Mr. Spofford had for some time served as an assistant in the Congressional Library before he became chief librarian in 1865; and in that earlier period he had given ample evidence of extraordinary capacity in his chosen field of work. He had catalogued the Congressional Library, and had done much to render it quickly and satisfactorily available for the reference of legislators, and the use of others who desired to delve in its rich treasures of *Americana*. It now contains approximately 700,000 volumes, while in 1865, when Mr. Spofford assumed full charge, it had only 90,000.

The early history of the nation's library at Washington was a checkered and unfortunate one. A considerable and very valuable beginning had been made in the first fourteen years of the present century; but the books were all burned up by the British when they destroyed the Capitol building in 1814. Then Congress bought Thomas Jefferson's library of about 7,000 volumes and made it the nucleus for a second collection, which in 1851 had grown to about 55,000 volumes. In that year came another fire, from which only twenty thousand books were rescued. A new beginning was made the next year when Congress appropriated \$85,000 for purchases; and subsequent annual appropriations rapidly filled the breach.

The growth of the library under Mr. Spofford's administration has made several large bounds through special accessions, such as the scientific library of

the Smithsonian Institution; but by far the largest source of supply has come from the copyright law of 1870, which requires the deposit in the Congressional Library of two copies of each publication that claims protection under the American copyright provisions. The fact that much of the material thus accumulated would be worthless for the purposes of the Boston or Chicago public libraries, or for such a great reference collection as the Astor Library in New York, does not have any bearing upon the functions of the national library at Washington. It is of the utmost importance, both for present and for future purposes, that there should be one comprehensive collection of American books and publications of all kinds—preserved and arranged as to bear faithful testimony to the life, the thought and the work of the American people from year to year. The National Library, besides its complete stores of American books, also preserves many newspaper files. The future student of any department of our national history must find the vast collection developed under Mr. Spofford's guidance his principal source of knowledge.

Until recently, collections like this would have been comparatively useless, because no means had been invented for cataloguing or indexing in such a way as to give the inquirer a certain, prompt and maximum use of the resources of the store-house. Even at the present time the national library of France (the *Bibliothèque Nationale*), with volumes and manuscripts approaching three millions in number, has been only to a very limited extent reduced to working order. The great German collections at Berlin, Munich and Dresden, each containing from half a million to a million books, have never been indexed in a manner that would be considered neces-

THE NEW NATIONAL LIBRARY BUILDING AS IT WILL APPEAR.

sary for practical use by our advanced American librarians. The huge English library in the British Museum is comparatively available—though its cataloguing and indexing methods seem clumsy and inadequate to the American expert. But in Washington, if Mr. Spofford's strength is spared for a few short years, we shall see a collection of books and pamphlets, exceeding one million in number, brought under so perfect a system of classification that any single work may be found without a moment's delay while on the other hand the entire resources of the library as regards any particular subject may be placed at the disposal of the investigator. It would be well-nigh impossible to estimate at its full value the tremendous impetus which has been given to knowledge by this triumph of the librarian's skill, which renders available all the knowledge of those who have gone before.

Mr. Spofford is himself a living index and a walking cyclopedia. Statesmen come and statesmen go, but Mr. Spofford holds the even tenor of his way as a mentor of each successive Congress. The ambitious legislator who is about to prepare the speech of his life finds Mr. Spofford ever ready to supply him with the necessary documents and authorities. Though chaos seems to reign in library quarters that are not large enough for half of the existing accumulation, Mr. Spofford and his helpers in reality know in what corner to rummage, and just how deep to excavate, for any book or article that may be desired. What aid to good causes and sound legislation Mr. Spofford has been able to render can never be wholly disclosed; but it is probable that the great scope of his public

services will be better appreciated fifty years hence than at the present time.

The iron shelves have already been placed in two great stack rooms of the new building, and the tiers rise one above the other to the number of nine. The shelving thus in place, according to Mr. Spofford's estimates, will accommodate two million books, or more than twice the existing accumulation; but when the Congressional Library reaches the two million point the new building will by no means have been outgrown. Provision has been made for the fitting up of additional stack rooms, so that the building could house from five to six million volumes without infringing seriously upon the great halls and corridors and the many rooms reserved for other uses. At the centre of the building is a great octagonal reading room. There will be abundant provision for congressional committee rooms and for the adequate exhibition of maps, engravings and special treasures of various sorts. There will be retained in the Capitol building a select reference library for the ordinary use of Congress. It has not been decided whether or not the law library, which is approaching 90,000 volumes, will be retained in the Capitol building or removed; but it is more likely that it will find accommodation in the new structure. The great scientific and literary collections at Washington are making the national capital a Mecca for advanced scholars who wish to avail themselves of opportunities for research. These educational facilities, which of late have attracted so much notice, will find their centre and their crowning feature in the new library building and its contents.

THE CAPITOL AT WASHINGTON.

AN AMERICAN HISTORICAL PILGRIMAGE.

OLD SOUTH MEETING HOUSE, BOSTON.

LAST year in connection with the summer meeting of the University Extensionists at Philadelphia, a series of delightful excursions to historic scenes in that general vicinity was conducted by Mr. Lyman P. Powell, one of the staff lecturers of the Society. The *REVIEW OF REVIEWS* meanwhile had espoused with enthusiasm the idea of occasional historical pilgrimages, as a means for a revival of patriotism no less than as a rational mode of combining recreation with the acquisition of knowledge by the best and most stimulating methods. Mr. Stead had made England ring with a noble plea for an awakening of interest in the historic shrines of the mother country; and had projected an imaginary tour upon which English and American visitors were to be guided and addressed at various points of historical note by eminent scholars and special authorities. Convinced of Mr. Powell's special adaptation by nature and training for the leadership of American historical pilgrimages, the *REVIEW OF REVIEWS* persuaded him to prepare for its pages an article explaining what had been attempted in a limited way in this country, and what might be done upon more systematic lines in the future. Mr. Powell's article, entitled

"The Renaissance of the Historical Pilgrimage," appeared in the October number of the *REVIEW*, and it received a very wide approval. Distinguished historical writers and scholars, statesmen, clergymen, authors, and public-spirited citizens lost no time in indorsing Mr. Powell's suggestions, and those of the magazine. In this article Mr. Powell prophetically outlined a pilgrimage for 1894. It is pleasant to be able to announce to our readers that the prophecy is to be realized, that the details have been fully arranged, and that Mr. Powell, as a representative of the well-established Society for the Extension of University Teaching, is to conduct the expedition.

The summer meeting of the Extensionists is to be held at Philadelphia during four weeks in July, ending upon the 28th. On that same day the Pilgrimage will be organized and officially begun with a public meeting in Independence Hall. This meeting will be especially commemorative of Washington's appointment as commander-in-chief of the Continental forces, and several distinguished historical writers will make careful addresses. Competent guides will conduct the pilgrims through the historic rooms of Independence Hall, and to a number of places in the vicinity which have important colonial traditions. On the same afternoon a visit to Cramp's shipyard, where so many of the best specimens of our new navy have been constructed, will bring the pilgrims into touch with a phase of more recent history. The Academy of Fine Arts, Girard College, the social settlements in the slums, and other institutions and features of Philadelphia life will add to the educational value of a day which will be ended at the University of Pennsylvania, where Mr. Talcott Williams is to give the first of a series of addresses upon the cities that the pilgrims will visit. Mr. Williams is brilliantly qualified to discourse concerning Philadelphia's contribution to American history, and his lecture will be illustrated with the stereopticon. He will also add much to the intelligibility of the journey as a whole by explaining the physiography of the country that is to be traversed.

It is a ten-days period that has been fixed for the Pilgrimage, and it begins upon the last day of the week. Sunday, July 29, will be spent in Philadelphia, where the pilgrims will be invited by the rector, the Rev. C. Ellis Stevens, to attend services in the old Christ Church, which dates well back into the colonial period, and whose pews have been occupied by so many of the founders of American independence. On Monday morning the pilgrims will depart for New England, and will spend the afternoon at Hartford under the care and auspices of the Connecticut Historical Society. The wealth of historical association that the capital of Connecticut can exhibit in a brief half day will surely surprise most of the visitors. The night will be spent at Boston, where the order of

exercises will begin the following morning with an old-fashioned town meeting in the Old South Meeting House. Otis, Sam Adams, Warren, and their compatriots, will be recognized as present in spirit, while Col. Thomas W. Higginson, Dr. Edward Everett Hale, William Lloyd Garrison, Hezekiah Butterworth, Horace E. Scudder, Edwin D. Mead, A. E. Winship, Robert Wolcott, and numerous other eminent Bostonians are expected to be present in mortal flesh as evidence that New England still produces great men. Col. Higginson is to make the special address on Boston's contribution to American history, and Dr. Hale is to talk, as he can do so authoritatively, upon the historic landmarks and old streets of the New England metropolis. Of the visit to the old State House and to Faneuil Hall, of the detailed study that is to be made of the battle of Bunker Hill, with the help of such authorities as Mr. Winship, of the *Journal of Education*; of a journey to Charlestown and the navy yard, and another to Copp's Hill with its ancient burying ground, and to Christ Church in the track of Paul Revere, we cannot speak in detail.

But something must be said of a memorable day which will begin in Cambridge under the elm where Washington assumed command of the army, and from which rendezvous Harvard University and the historic spots of old Cambridge are to be visited. Among other interesting things, Longfellow's home, which was once the headquarters of Washington, will be opened to the pilgrims; and Lowell's home will be another of many Cambridge shrines. From Cambridge, in comfortable brakes—or barges as they call them in New England—the pilgrims will be driven along the famous road to Lexington and Concord. They will hold a meeting in the Lexington Town Hall, where a competent authority is to show the significance of Lexington in our history. One who has never visited Lexington can hardly imagine how much survives there to fire the historical imagination. This ride by way of Cambridge and Lexington to Concord is perhaps the most interesting one, from the historical point of view, that the United States affords. As one approaches Concord he passes the " Wayside " house where Hawthorne lived so many years, and also the home of Emerson. The battle ground at Concord, and the literary memories of the place, lend an almost indescribable charm to the visit and make it one of our most cherished spots. Senator Hoar, among others, is expected to add to the instructive character of the Concord visit. The special address on Concord's contribution to American history and civilization will be delivered by Mr. F. B. Sanborn, who is himself one of the most distinguished men in the long list with which that town is to be credited.

The visit to quaint old Salem will be more charming as a surprise than almost any other portion of the rich programme. The Essex Institute will be prepared to make the pilgrims welcome, and will not allow them to depart in ignorance of Salem's importance in our early naval and commercial history. Nor will the scholarly members of the Essex Institute seek to divert the attention of the pilgrims from the

" witchcraft houses " or the Gallows Hill. Especially valuable and significant is the programme of speech-making that has been arranged for the Salem visit. The return to Boston will be by steamer from Nahant after a visit at the home of Hon. Henry Cabot Lodge, another of our authorities on colonial history. There will follow the visit to old Plymouth, where the Summer School of Applied Ethics will be in session and will join heartily with Plymouth's hospitable descendants of the Pilgrim Fathers in making welcome this new detachment of pilgrims. There is much to see and learn in Plymouth, and those who may go there anticipating little of interest will be most agreeably surprised and will certainly determine to go again some day for a longer sojourn.

The objective point for Saturday evening, August 4, will be the historic town of Newburgh, on the Hudson river above West Point; but on the journey thither from Boston the pilgrims will stop at Pomfret, Conn., to visit the scenes made famous by the intrepid Israel Putnam, and the ride will also be broken at Fishkill, whose historical relics and reminiscences will be fully exploited for the benefit of the visitors. The Newburgh Historical Society will greet the pilgrims on Saturday evening, and the Rev. Dr. William K. Hall will elucidate the meaning of Newburgh and its vicinity in the formative history of America as an independent nation. An interesting Sunday is planned at Newburgh, and Monday morning will witness the embarkation of the pilgrims for West Point, members of the Newburgh Historical Society accompanying the visitors in order to point out the many spots which have historic associations along either bank of the Hudson. Arrangements have been made for an inspection of West Point under official guidance, and the journey by boat will be resumed with Tarrytown for the objective point. The scene of John André's capture, and the localities immortalized by Washington Irving, cannot fail to make the visit memorable to pilgrims who have never visited Tarrytown before.

As the journey by river is resumed and New York is approached, a score of memorable localities will be pointed out,—localities whose historic significance, be it confessed with regret, is not known by one New York teacher in fifty, although local pilgrimages of teachers and pupils might easily be arranged for any sunny afternoon. The opportunity that New York city itself affords for a peripatetic study of American history are numerous and important enough to occupy many days. Brooklyn and adjacent parts of Long Island have also much of historical interest to offer. Mr. Powell's body of pilgrims will not attempt to inspect these nooks and corners in and about New York with exhaustive thoroughness, but plans have been made which will render their brief stay highly instructive and very agreeable. Among other things it is expected that Mr. Theodore Roosevelt will address the pilgrims upon the place of New York in American history; and many other citizens are expected to do their part towards making the visitors welcome and promoting their historical inquiries.

The brilliant campaign of Trenton will be the subject of study on the ground during the last day of the pilgrimage. The morning of that day will be spent at Princeton, and Professor William M. Sloane will deliver an address explaining the significance of that famous locality in our history. The afternoon will be spent in Trenton, where careful arrangements have been made to insure a clear understanding of Washington's movements, and of the strategy that overcame the unwary Hessians. In the evening the pilgrims will return to Philadelphia and will there disband.

This summary account of the arrangements that Mr. Powell and the enterprising managers of the University Extension Society have prepared, does no justice whatever to the detail of a campaign that has been worked out with an extraordinary amount of care and fidelity, and with the benefit of advice and co-operation on the part of a great number of the men and women best qualified to make successful a field

study of American history. The University Extension Society has no possible desire to monopolize this rational and delightful method of vacation study. On the contrary, its great object is to demonstrate the value of such methods so satisfactorily that local pilgrimages will become usual in all portions of the country, and that teachers,—whether professors of history in higher institutions or instructors of children in public schools,—will come to adopt as a matter of course the plan of visiting with their pupils every accessible spot which could throw any light upon local or general historical topics. After all, the method is more important than the knowledge to be gained. There is no county in the United States so remote from the scenes of our colonial or revolutionary history that it has not some spots which have their importance in the local record of events; and the visiting of these spots can be made by any intelligent teacher contributory to the teaching of historical lessons whose principal scenes lie far distant.

THE RESCUE OF VIRGINIA'S HISTORIC SHRINES.

THE NEW MONUMENT TO
MARY WASHINGTON.

OUTSIDE of New England,—where in the fullness of time there has at length appeared a race of men who have leisure and a knowledge and disposition to use that leisure well,—it must rest chiefly with the women of the land to find out our neglected and decaying shrines and memorials, and to render due honor to our heroes and heroines of bygone days. It is to patriotic women that the country owes the rescue and preservation as a national memorial of Washington's home at Mount Vernon on the Potomac. To patriotic women is now due the rescue from neglect of the grave of that noble colonial dame, Mary, the mother of Washington. At Fredericksburg, Va., on May 10, a granite monu-

ment of plain obelisk design some fifty feet in height, bearing the name of Washington's mother, was dedicated in the presence of a distinguished company. The principal guest of the occasion was President Cleveland, who was accompanied by several members of the Cabinet and their wives. Governor O'Farrell of Virginia was present, and many distinguished public men from Washington, Richmond and elsewhere joined in this pilgrimage, and heartily seconded the strong tributes of praise that were bestowed upon the virtues of one who stands as an heroic type of the mothers that have given us our great men and o whom our nation is most deeply indebted for its saving endowments of moral character.

The erection of a monument to Mary Washington is no new project, but earlier efforts at different times in the past century were never brought to consummation. It remained for a band of earnest women to take the initiative. What the daughters of honored American ancestors have accomplished for the preservation or erection of historic monuments in instances like those of Mount Vernon and Fredericksburg, is merely illustrative of a great number of less conspicuous but similarly important undertakings to which American women, notably in Virginia, are now devoting themselves. The men of Virginia have been in no mood for antiquarian research since 1865. They have been engaged in an effort to repair the ravages of war;—an effort the difficulty and seriousness of which can never be comprehended except after some study, upon the ground of comparative industrial and agricultural conditions.

The exigencies of warfare thirty years ago showed scant respect for the relics and traditions of the revolutionary period. The torch of invasion did not make nice discriminations, nor did the leaders on either side choose their battle grounds or their strategic positions with reference to the sparing of interesting colonial houses, the memories of which might attract peaceful historical pilgrims a generation later. Thus the four years of campaigning in the valleys of Virginia annihilated very much of what had survived from colonial days down to 1860. But even more destructive, perhaps, than the war period itself, was the sad period of abandonment and neglect that immediately followed the four years of marching and countermarching. Great areas that had been under cultivation for a century and a half quickly lapsed to a condition of primeval wilderness. Abandoned houses crumbled away. Cleared fields became first bushy copses, then second-growth woodlands, and in a few years thick and heavy forests. Ancient burying grounds fell into lamentable decay. The grave stones were toppled over by the growing roots of trees; and their inscriptions, buried under vegetable mold, crumbled away in the successive processes of frost and thaw.

From this condition, threatening an almost total obliteration of much that it is most desirable to cherish for reasons of history and of a just pride of lineage, the women of Virginia are now coming to the rescue. They are doing what they can to save historic houses; to keep intact the churches that have survived from the colonial period; to restore and preserve inscriptions in churchyards and cemeteries; to collect and insure the preservation of parish and county records, and other interesting manuscripts and documents; to find and keep the furniture and household effects of the olden time, and in short to save everything of antiquarian significance. When due regret has been expressed for all that was destroyed beyond recovery from 1860 to 1865, and for the far greater loss due to the neglect during the twenty-five years following the war, it is still true that Virginia is marvelously rich in surviving historical objects and materials. The task of checking the further process of destruction is one in which the daughters of Virginia deserve the encouragement of the whole nation.

The peninsular region is especially inviting to the student who would strengthen his comprehension of occurrences by visits to their scenes. Of ancient Jamestown nothing remains but a ruined church tower with a broken wall and some interesting but dilapidated tombstones. Until lately these precious relics have been grossly neglected, and vandalism had joined hands with the destructive agencies of nature. Henceforth the little that remains is to be carefully guarded. Moreover, Jamestown Island and the broad sweep of the river speak for themselves, and a visit to the spot greatly aids the student in his understanding

of the early colonization of this continent. A few miles back from the river, on the watershed that divides the valley of the James from the valley of the York, is old Williamsburg,—for a long time the colonial capital of Virginia. It is also the site of old William and Mary College, an institution which trained so many of the statesmen of the revolutionary period. Of all localities famed in the early annals of Virginia, Williamsburg best retains its ancient appearance and characteristics. Its quaint old houses gladden the eye of the student or the artist visitor; and the witness it bears concerning a period when these seaboard States were loyal colonies of Great Britain, is more distinct and striking than that of any other town in the country. It would be a thousand pities if Williamsburg's marvelous escape from the ravages of war, from the ever-active fire fiend, and from the restless desire for change that has destroyed so many old towns, should not now lead to well-planned efforts to preserve every old house and object of historical interest in the entire village.

In the opposite direction from Jamestown, a winding road leads from Williamsburg to the broad estuary of the York river, and to Yorktown, another sleepy old village that seems by some miracle to have escaped the influences of the nineteenth century. The only evidence of recent activity in that neighborhood is the noble monument erected some years ago to commemorate the final surrender of the British revolutionary forces to Washington and his French allies. The ladies of Williamsburg are among the leading spirits in the new movement for the preservation of Virginian shrines, and among other of their recent achievements they have secured, for the purpose of an antiquarian museum, the solid little octagonal powder-house that was built in early days with a time-defying strength.

At Richmond, the newer capital to whose claims Williamsburg was eventually compelled to submit, there is much to invite the attention of the historical pilgrim; while Charlottesville, the site of the University of Virginia, and many a spot in other portions of Virginia, is equally inviting. The accomplished scholars who will plan next year's historical pilgrimage in connection with the University Extension meeting at Philadelphia will doubtless need no advice from amateur investigators or journalistic well-wishers. But we shall nevertheless hazard the suggestion that nothing could more fittingly follow this year's journey to the shrines of New England, than a tour next year to proceed from Philadelphia to Baltimore, Washington, Richmond, Williamsburg, and Fortress Monroe, including as many other points of historical interest in Delaware, Maryland and Virginia as the limitations of time and the facilities for travel would reasonably permit. To most teachers and students this journey would be full of novelty, pleasure and instruction.

CONSTITUTIONAL HOME RULE FOR CITIES.

BY WILLIAM H. HOTCHKISS.

A BRIEF glance at the development of city governments in this country is necessary for an understanding of the constitutional question now under discussion in New York. There have been three periods, each with distinctive characteristics. First came the post-colonial period from 1787 to about 1846. Its characteristics were checks and balances, the mayor against the councils, each council against the other, together with some governmental peculiarities inherited from Europe. Thus, the municipal suffrage was limited to tax payers; while in some cities, as in Philadelphia in 1789, the councilmen held office for life, the aldermen for a limited period, and the two councils, not the people, chose the mayor. This illogical system somehow worked well. Cities, however, were then but hamlets compared to the immense neighborhoods of to-day, and universal manhood suffrage had not been adopted.

The second period, from 1846 to 1872, was a succession of municipal mistakes and scandals. Two causes led to the decline, the herding in cities of a large proportion of the immigrants then flocking to America, and contemporaneous with that the opening of the suffrage to them. City affairs passed at once from the control of the most interested—the tax payers—to the control of those who pretended to be most interested—for what “there was in it.” Results were quickly apparent. The mayor, formerly a responsible executive, was shorn of most of his power. The two councils were merged into one, made up, as a rule, of the worst elements of society, and to this single irresponsible body were given plenary powers under the local boss. This system bred politicians and politicians of the worst type. It bred also indifference among the responsible classes, as has been well said, *tacet* became *licet*, until a period of governmental corruption such as the world had never known culminated in that most infamous American, William M. Tweed.

But his career proved an object lesson. The indifference was shamed into action. *Tacet* and *licet* gave way to *pudet*, and the tyranny of the plunderers came temporarily to an end. Then began what may be called the third period. Its characteristic tendency has been warfare—a continuous struggle between the local statesman on the one hand and his tax-paying bondsman on the other. The cry all over the country has been: Down with the common council. As a result, we have to-day, not an irresponsible council, but a responsible mayor, and where there was one council before, we now, as a rule, have two,

each to watch the other. In the struggle the citizen has had the best of it, though the ward politician has contested every inch of ground. Good government in cities has now passed the period when it can be laughed out of court as a “reform.” Partisan conventions declare for it; candidates pledge it their support and disinterested citizens sometimes dare hope that its victory is won.

But the glad day is not yet here. Conventions and candidates soon forget their pledges; local spoilsmen, with united front, cling tenaciously to the old system; while municipal reformers go on haranguing and writing, each with his ameliorating device, but without organization, without much promise of success. Even in this year, when good government in cities is a rallying cry heard throughout the land, everything is unsettled. Some say, try limited suffrage; others know that restrictions of this character are now impossible. Some would accomplish reform by “smelling” committees from the legislature. Still others advocate the abolition of the ward system and the election of municipal councilors on general tickets. While the most advanced demand separate municipal elections and a system of proportional minority representation. The city governments even of a single State, reveal differences of structure and administration, as great as would a comparison between the boss ridden council of Tweed and the present autocratic executive of Brooklyn; and, in methods of choice, as between the ward system of New York and the plan of electoral hundreds recently vetoed by the Governor of the Empire State.

Viewed in this light, the situation is ripe for the New York Constitutional Convention. What has been done is to provide a remedy here and there, not a relief. Yet above the discordant din of the reformers, one cry has sounded out full-voiced and certain. It is the rallying cry of recent elections, the only reform about which all reformers agree, the hope of the city dweller to-day, and the bugbear of the local statesman—Home Rule for Cities. Nor is this a new cry. Parties have platformed it, executives have promised it, representatives have pledged it their support. But the city dweller has learned that in this reform, as has been well said, each crowd is “like Ensign Stebbins, ‘for the law, but agin’ its enforcement.’” Legislation has become a barter of favors between the people’s *mis*-representatives; and, as a matter of fact, a city gets what it wants from a legislature just as it proves to be the majority’s or

the other's ox that is gored. Home rule for cities, under existing conditions, is a legislative will-o'-the-wisp. The people of a locality are best fitted to say what is best fitted to them. The rallying cry of the present and the future is and must be, not "Legislative" (God forbid!), but "Constitutional Home Rule for Cities."

One of the speakers at the recent National Conference on Good City Government declared that any widespread municipal reform must begin in New York. The beginning would have been made long ago had New York's constitution been abreast of the times. It prohibits private and local bills "incorporating villages," and imposes on the legislature the duty of passing acts "for the organization of cities and incorporated villages," and to restrict their debt-making powers. But not a word against special legislation affecting the incorporation of cities, not a word restricting amendments to their charters, not a word compelling general urban laws. It is no marvel that charter tinkering has become the favorite function of its legislature, or that the oligarchy of corruption has made the cities of New York awful examples to the healthier municipalities of other States. An examination of the checks on the charter tinkerer in other constitutions, therefore, becomes interesting, if not prophetic of the action of the New York Convention this year.

Thirteen of the forty-four States have practically no constitutional restrictions affecting the charters of cities. Five of these are in New England, States little controlled by the foreign vote and all having a more or less restricted suffrage. Four are in the South, none of them, save Maryland (in whose constitution Baltimore is given a separate article), boasting a city larger than Rochester; and one, Oregon, in the West, with no important cities at all. The other three, New York, Kentucky and Wisconsin, of all the progressive States west of New England, permit almost unlimited meddling with city charters. Of these, however, Wisconsin has a general urban law, and Kentucky has no important cities save Louisville. New York, the most populous, with more than thirty cities and among them the metropolis of the nation—poor New York, corruption-breeding and corruption-ridden—stands fearfully and wofully alone.

The organic law of some thirty of the States guarantees a greater or lesser degree of municipal home rule. Some States even do this in two or three ways. The restrictions which have been tried may be thus classified:

1. Prohibition on local or special legislation affecting cities, coupled often with a mandatory provision for general urban laws;
2. Publication in the locality to be affected of a notice of intention, before a local bill can be introduced in the legislature;
3. The initiative or referendum, or the two combined, applied to the construction and amendment of city charters.

The first is best understood and most common. Pennsylvania phrases the prohibition well:

The general assembly shall not pass any local or special law . . . in incorporating cities, towns or villages, or changing their charters.

Missouri commands general laws in the following terse language:

The general assembly shall provide, by general laws, for the organization and classification of cities and towns.

The effect of the first clause is a general municipal corporations law; of the second, a classification of cities according to population. The first is in force in Pennsylvania, Illinois, Louisiana (where, however, New Orleans is exempt), Mississippi and Nebraska. The constitutions of California, Washington, Iowa, Arkansas, Tennessee and New Jersey have similar provisions. Thus in one-fourth of the States there is a direct check on legislative meddling with the charters of cities. The large proportion of Southern States will be noticed; but their constitutions, as well as those of almost every Northern State having this restriction, have been adopted or amended in this particular since the war. This step, though toward home rule, is not a safe one in New York. Its highest court has decided, in effect, that a law in terms applying to all cities of the State between specified upward and lower limits in population, even though applicable in reality to but one municipality, is a general law. Such a constitutional prohibition against local urban legislation might therefore prove of little value.

A provision for uniform legislation applicable to cities is also found in nine or more States, among others, Ohio, Missouri, Colorado and Nevada, in addition to some already mentioned. But this provision results in a classification by population, each important city being a class by itself; and in effect the general law becomes general only as to the small and medium-sized places, while special legislation affecting the large cities is as possible if not as probable as before. This is a step, though a short one, toward constitutional home rule.

There is more hope in the device expressed in the following clause from the constitution of Mississippi:

No local or special law shall be passed unless notice of the intention to apply therefor shall have been published in the locality where the matter or thing to be affected may be situated, which notice shall state the substance of the contemplated law, and shall be published at least thirty days prior to the introduction into the assembly of such bill, and in the manner to be provided by law.

This is a favorite clause in Southern constitutions. It will be found in those of Georgia, Alabama and Louisiana, in addition to Mississippi, as well as, in substance, in those of New Jersey, Pennsylvania and Colorado. In all ordinary conditions this device would accomplish its purpose. It permits the people most affected to instruct their representatives. But the cities of New York have lately had too much experience with charter amendments passed by legislatures in spite of their protests to place much confidence in this species of home rule.

The truth is, neither of these devices would accomplish constitutional home rule in New York. There

would still be a strain of legislative rule in the reform, and its progeny might not be trustworthy. We hear much these times about that good old Jeffersonian idea of trusting the people. In city government at least they can be trusted. They can be trusted so far, too, that they shall not only formulate their organic law themselves through a committee of their choice, but also adopt or reject that committee's work by a direct vote, without the intervention of any *mis*-representatives. Some would make the legislature the initiating committee, and give validity to its charters and amendments only after ratification by a majority vote of the people affected. This would be but a half reform. State legislatures have not merited the confidence of city dwellers, and no valid reason can be given why the legislative body of a State should ever do more for municipal corporations than to supply them with charters of very general provisions, leaving all details to the cities themselves. Indeed, it is axiomatic that the further city government can be removed from the initiative or control of State legislatures, the more satisfactory will it be to its citizens.

But the hope of hopes is a combination of the initiative and referendum, already in force in some of the States.

The constitution of Missouri provides that any city having a population of more than 100,000 may frame its own organic law by electing a board of thirteen freeholders, which board shall within ninety days return a proposed charter; and that, if such charter is ratified by a four-sevenths vote at a general or special election, it shall supersede all existing charters and laws. Provision is also made for amendments to such a charter by a three-fifths vote, and for the submission of alternative sections, to be voted on separately and accepted or rejected without prejudice to other articles. The same procedure is authorized by the constitution of California, though, after ratification by direct vote, the charter must be submitted to the State legislature for adoption or rejection as a whole. The young State of Washington has gone still further, and, improving on both Missouri and California, provides for charter initiative and referendum in all cities having a population of 20,000 without a final reference to the legislature.

As a scheme of constitutional home rule, this plan approximates the ideal. California still insists on the consent of a god-fathering legislature. But in the other two States, city governments may spring, under that great parent, the constitution, from the people themselves. The legislative body of the city directs the choice of a charter commission by the people, the commission prepares a charter under the scrutiny of the press and the people, that charter is published a required number of times in a required number of newspapers, the people then vote Yes or No to its provisions. Amendments to a charter so adopted originate in the city council and are submitted for adoption or rejection by the people themselves. Alas, for the nimble tinkerer, could such a clause become a part of New York's organic law!

Home rule for cities would then become constitutional and legislative jugglery of no avail.

There is hope, too, that the present New York Convention will propose such a plan. The labor organizations of that State have representatives on the floor of the convention; and, some weeks ago, they sent out an official pamphlet, proposing an amendment almost identical with that of the State of Washington, but with an important addition. The New Yorkers propose that the extreme initiative, *i. e.*, the first step in the procedure, rest not only in the city council but in a petition of at least one-tenth of its qualified voters. By their amendment, one-tenth of a city's electors could thus compel a recalcitrant council to cause the election of a charter commission. It provides also for the publication of the proposed instrument, its recording in the proper offices, and that a majority of the voters, declaring for its adoption, shall be sufficient.

If the New York Convention can be brought to a realizing sense of the practicability of this quite radical change, why not, it may be asked, go a step further? Why not provide for *permanent* charter commissions in cities? No State has gone this far. Yet it is home rule, constitutional home rule of the purest, simplest sort. Let it be provided that in every city of the State of New York there shall always be a body of fifteen or more representative citizens, chosen if possible on a general ticket by minority representation and serving without pay, whose sole business it shall be to publicly consider and submit to the people all proposed changes in the charter; add a provision that no proposal be considered unless supported by a resolution of the city council or by a petition signed and verified by at least 5 per cent. of the qualified voters of the corporation; provide for the publication, submission and ratification of the charter or amendments, and the people of each city would at least be the sole masters of their own organic law.

The question will be asked: What will become of Father Knickerbocker if his charter (the Consolidation Act) is made subject to the orders of a Croker? The answer is: Surely, that long suffering old gentleman could not be worse off than he is. Surely, too, if there is merit in first principles, the city dwellers of New York, as well as those of Ithaca or Mount Vernon, are the best judges of what they want, and, if the responsible classes of the metropolis cannot unite on an issue such as would frequently be presented were a charter commission a part of the city's government, they deserve their punishment—more corruption, more bosses, more misrule.

The New York Convention is awake to the fact that the time has passed when the rhapsodies of the reformer may be branded as the vagaries of a dreamer. It understands also that what is most needed now is a constitutional basis on which cities can work. It will do its work well if it permits the growing life-centres of the State, always consistent with the constitution and the laws, to seek the greatest good to the greatest number in whatever way seems to the majority of their voters the best.

AN AMERICAN IN THE ROYAL ACADEMY.

A SKETCH OF JOHN S. SARGENT.

THE fact that a man has achieved a high success in any direction will naturally awaken, in the public, a curiosity to know what has contributed to this peculiar superiority which distinguishes him. One would like to hear of the adverse circumstances that have been surmounted, whether of birth, social environment, parental objections to his choice of career, or perhaps a long and obstinate lack of appreciation on the part of the public he has appealed to by

JOHN S. SARGENT.

his work. It seems to be the fashion, perhaps through a desire to give added lustre to the brilliancy of the results which are evident, or that the facts may really warrant the emphasis, to enlarge upon the difficulties through which the person has fought and finally reached a secure position of established reputation. This is frequently the tenor of biographical sketches, and the moral they convey is obvious. But no less obvious, it seems to me, is the value of an achievement which has been the result of the reverse of these conventional conditions; and the record of such achievement is likely to be of interest to all who appreciate intellectual endeavor, whether they belong to the lay public or to those following the same professional career.

The subject of this brief review, Mr. John S. Sargent, has just been elected Associate of the Royal Academy, but the road he has traveled to reach its portal is somewhat different from the plodding, toil some pathway that many others have trodden to gain its grateful shade.

HIS EUROPEAN TRAINING.

Mr. Sargent was born in Florence of American parents, and with what one may regard as the pro-

verbial silver spoon in his mouth. Surrounded by all that material ease and leisurely culture can supply, this bright artistic star has had no cloud to obscure it from its rise. Florence—the name alone is an inspiration to those who love beauty and its traditions! Unite to this, family ties the most refined and beneficent—imagine those closest to you possessed with an enthusiasm for nature, and the greatest familiarity with its best interpreters in the world of art, and you will have a faint idea of the perfect conditions for fostering an artistic bent that favored young Sargent from the first. Although born in Italy, the first language he was taught to speak was the German. One can not tell if this fact had anything to do with his later knowledge and love of music; but he is now an enthusiastic admirer of Wagner, and reads and plays the great German's piano scores with intelligence and the deepest pleasure. After receiving a classical education in the best schools of Florence, at the same time studying music, young Sargent at the age of eighteen removed with his parents to Paris. These earlier years had also been devoted to drawing and painting as closely as was consistent with the pursuit of other studies incidental to the education of a gentleman; for he came up to Paris well grounded in classical and historical knowledge. There was nothing cold in these acquirements of his—they lived in his mind with a graphic and, indeed, almost actual sense. The idyls of Catullus, the splendid, stately, monumental life of ancient Rome; the courtly, sumptuous, and intriguing period of the Grand Monarque, each in turn became to an unusual degree contemporary with himself, as he roamed in imagination through the pages of their chroniclers. Their costumes, surroundings, and daily practices seemed, in his mind's eye, physical facts as he dwelt upon them.

AN INTERPRETER OF THE PAST.

At the time of first meeting him, I regarded Sargent as one born to realize in art a faithful portrayal of the past, whether legendary or historical, so potential seemed his grasp of its salient moments in history, and so subtle his appreciation of these faint and fragrant stories of the classic myths and physical emotions, that colored the young world's pastorals. All of these subjects seemed to be well within the range of this highly cultivated and richly endowed student.

Of course the intellectual and even literary paternal supervision of his artistic studies, in conjunction with his own natural predisposition for art, gave him at once a certain advantage over the majority of his associates at the *atelier* of Carolus-Duran, where he elected to place himself. It seems a great many

PORTRAIT OF HENSCHEL, THE MUSICIAN, BY SARGENT.

years since that bright morning when tall but boyish looking Sargent, portfolio under arm, came with a certain diffidence to the *atelier* Duran and showed, with modesty, the really surprising sketches by which he hoped to recommend himself to that master as a pupil. The students gathered around the new comer, and many I know mentally applauded the care for *form* and *line* that these studies even then betrayed. From the character of this work which he showed Carolus on presenting himself as a candidate for admission, one would perhaps have thought that he would have chosen some other artistic influence with more advantage; but I now believe that no other direction would, for him, have been so wholesome. Durand's large, broad, magisterial manner of painting and of *seeing*, fitted well, it proved, the quality of corporeity which characterized Sargent's mind whenever it was a question of graphic portrayal—and this, without in any way making of him an imitator. His background of cultivated thought and taste tempered any tendency to copy

those brilliant and masterly examples of portraiture which Carolus was constantly producing with continued success and applause.

NO DRUDGERY IN HIS SCHOOLING.

It is a fact, that Mr. Sargent has shown himself consistent from the beginning. On coming to the "school" he seemed, even at that comparatively early period, to have passed through the pains and difficulties of learning to draw. What most preoccupied him on seeing a new model the first of each week, was the position he should take, that would be likely to reveal the finest line, and give the most original point to the head and figure on which he intended to work for the next six days. There was never, for him, any question of a more or less difficult point of view—no abrupt or oblique fore-shortening had any inconveniences, to speak mildly, for his ready and correct vision: it was amusing to remark how those less skillful would be influenced by Sargent's selection of pose, or method of indicating features. These facts I am giving to show that the "course of true love" in

art, which also seldom runs smooth, ran smoothly from the beginning, with this young painter, and still he gained success. I do not for a moment believe that Mr. Sargent has never set himself problems that have taken a whole man's manliness to solve. But this came later. What probably accounts for his early and apparently easy victories is, that most of the technical drudgery, the learning to draw, to force things into their places, was gone through with by him very early in life; this is somewhat the case with a skillful pianist, who would lead us to think he had forgotten the pains of practice when he charms the public with his finished touch. But neither was Mr. Sargent troubled by the material anxieties which so often harass the student.

And here is a point I would like to make.

"THE SPUR IN HIS BLOOD."

It has been a theory of mine that a greater trial of character and of talent is demanded to reach the top, with no absolute necessity at one's heels. ⁺¹ with

that stimulus which actual need incites. It is Lowell, I think, who says: "One can get some sort of pace out of the veriest jade at the near prospect of oats, but your thoroughbred has the spur in his blood." This spur Sargent has, and this spur, this responsibility to family traditions, breeding, and high taste has made of Mr. Sargent a painter of much style. His method, which is powerfully realistic, might be brutal, indeed, in other hands, but in his it becomes original, and almost an anomaly, for with the materials at his service to produce coarseness he proffers you distinction.

It was during the Centennial year of 1876 that, at the age of twenty, Mr. Sargent first visited America. He was absent from Paris but a few months, and returned to his studies under Duran in the autumn as full of enthusiasm as ever, and giving out in his talk acute and picturesque impressions the new world had made upon him. There was considerable that was literary in the quality of the view he took of American scenery and customs, but his impressions were above all else plastic and painter like.

EARLY TRIUMPHS.

Mr. Sargent first exhibited in the Salon of 1877 a cleverly painted and originally posed portrait of a young lady. In 1878 a group of fisher girls on the shore at Cancale—"En Route pour la Pêche." The portrait of his master, Carolus Duran, and "Neapolitan Children Bathing" mark his exhibit of 1879, and "El Jaléo" that of 1882. Previous to this, however—I think in 1881—Mr. Sargent showed that remarkable "Portrait of Miss B." which announced an established style, from which in any essentials, he has not since seen fit to depart. From this canvas his onward course has been logical and systematic.

We have now to record a series of such successes as rarely come to one so young. Among the works produced in the years immediately following may be mentioned, "Children's Portraits," 1883, and "Mme. Ganthercan," 1884. Mr. Sargent removed after this to London, where he has since lived. Here his canvases,

year after year, at the Royal Academy, and the Grosvenor have excited interest and stimulated discussion. To mention a few of the most notable, which may, perhaps, seem like reiteration so well are they known, I will recall those of the Misses Vickers, Mrs. White, Lady Playfair, Mrs. W. Playfair, and a fantastic portrait group entitled "Carnation, Lily, Lily, Rose," which last was purchased by the Trustees of the Chantry Bequest. The portrait of the musician Henschel belongs also to this period. A

"LA CARMENCITA."—BY SARGENT.

more recent work, the portrait of Ellen Terry, as Lady Macbeth, was seen last summer at Chicago.

Mr. Sargent visited America in 1887, and again in 1889, and on both visits produced a number of portraits which could only add to his high reputation. Those of Mrs. Marquand, Mrs. Boit, Mrs. Elliot Shepard, Mrs. Jack Gardner, Mrs. Kissam, and that of the infant daughter of Mrs. Goelet are readily in mind as representative examples of this painter's style. His brilliant canvas representing the Spanish dancer Carmencita, recently purchased by the French government, was produced at the same time.

A THOROUGHLY "AMERICAN" ARTIST.

The question is sometimes asked, May Mr. Sargent be regarded as representing in any sense the American school of art? It would seem that, so far as America has any distinct school, Mr. Sargent may be fairly claimed by it. His education has been entirely European, but so has the art education of many who practice their profession here. On both sides he is of purely American parentage, and this fact alone is perhaps sufficient to settle the question; for the American to-day readily assimilates the various methods that enable him to perfect himself in his craft; and most of this he learns abroad. Why should a few years, more or less, tend to expatriate him? Besides, the American temperament is probably as quick to recognize high accomplishment in the field of esthetic effort as that of any other nation, and by this very recognition Mr. Sargent has shown his aptness and superiority.

Up to the present time Mr. Sargent has strictly identified himself with work in portraiture, which is to me a mark of rare consistency in one to whom the various aspects of the outside world appeal with such potency. New "schools," progressive modes of treatment, original attitudes in the face of myriad-sided Nature, all secure from Mr. Sargent a ready and sympathetic attention. These sympathies have, however, in no way diverted him from his early choice of portraiture.

IMAGINATIVE POWER.

I have hinted that Mr. Sargent's familiarity with and intellectual interest in the past once suggested to us that he would be likely to revivify it through his art. He has not chosen to do this in the usual way, but does he not sometimes call it up in a masterly and significant fashion? His sense of analogy is strong, and at times, like our Hawthorne in literature, he sees in a chance subject an intimation, perhaps of a classic faun, and, lo! the pointed ears by some nimbleness of brush are all but seen. If the ages of civilization have not sufficiently refined one's sense, is there not in some of his portraits a glimmer of it to be seen still fluttering behind the mask that usage wears? This may be imaginary on our part, but it is not, I think, the painter's fault. He sees powerfully and records faithfully, following his personal insight, true to the light that is in him. However this may be, it is a psychical quality most valuable

in a portrait painter—and Mr. Sargent is certainly not without it.

At the World's Fair last summer, among the pictures in the American Section of the Fine Arts there hung a portrait of a young lady in white, painted by Mr. Sargent, and strange to say, with no great suppleness of brush,—but from it emanated the very essence of femininity and adorable young womanhood. Writing without catalogues or books, I do not recall the subject's name, if in fact it was given,—but of all the canvases by Mr. Sargent familiar to me, I remember none that more satisfactorily presented, in its finest sense, the realization of a living and breathing personality. The attitude of maidenly unconsciousness, one hand resting on her side while the fingers of the other lightly and listlessly touch the circle of gold beads that clasped the throat, is "felt" with a sensitiveness and artistic insight that are marks of a high order of creative work. There is much that is psychic in this interpretation of a human being. If, as we have the right to believe, a painter be in a certain sense the guardian of his "sitter," this subject has been entrusted to most faithful hands.

Mr. Sargent has viewed widely the whole field of creative art, and his natural taste has led him to study intelligently the methods and precedents of the past; but the marvelous facility of hand and veracity of vision that characterize his work have as yet scarcely been spoken of in this rapid review. Were these paragraphs intended mainly for the edification of the virtuoso and the student, I should find this side of the subject a fruitful one to enlarge upon. There is so much to say on this point of expressive workmanship, in which Mr. Sargent excels, that it would lead one to become too expansive for the limitations of an article like this.

ELEMENTS OF STRENGTH.

It will be interesting for any one, however, in viewing this painter's work, to remark the variety and significance of touch by which he defines the texture and condition of most opposing things—how a contour becomes confused and full of mystery as it sweeps into the background and again reappears sharp and "telling"—obedient to the laws of light upon an object, as Light itself obeying Nature's laws.

For precision, truthfulness, utmost fidelity of sight and the ability to unerringly record that which is visually revealed, Mr. Sargent stands among the first of his contemporaries.

That Mr. Sargent may extend his range into the field of decorative composition now seems probable, for this year he exhibits a work which has engaged his attention for some time past,—that of embellishing the Boston Public Library. These panels were painted in London, where he now exhibits them.

The Royal Academy has shown discrimination in the latest accessions it has made to its membership, and may be regarded as having exercised peculiarly good judgment in the election of Mr. Sargent.

FRANK FOWLER.

SIX POPULAR PAINTERS OF THE ROYAL ACADEMY.

THE yearly harvest of the English painter is, for the most part, gathered in May. He works in leisurely fashion throughout the summer, taking things easily, like the grasshopper in the fable; he contends, as best he can, against the almost Cimmerian darkness of a foggy winter; and eventually he finishes his work in feverish haste during the early months of spring. In May, if he be a painter of merit

SIR EDWARD BURNE-JONES.

or of position, the fruits of his labor are publicly exhibited. For this is the month in which nearly all the chief art institutions of London open their principal exhibitions of the year. First and foremost comes the Royal Academy, to which something like 12,000 works are sent, little more than a sixth of which are ever hung. Next in importance is the New Gallery, whose annual collection, while smaller than that shown at Burlington House, is held by some critics to be of a choicer and more uniformly excellent character. Then there are the two Water Color Societies—that presided over by the venerable Sir John Gilbert, and that headed by Sir James Linton—the Institute of Painters in Oil Colors, the Royal Society of British Artists, the New English Art Club, and other bodies which the exigencies of space forbid us to enumerate.

Practically, every one of these institutions has an exhibition open in May.

Of the English painters of to-day we present in this article short sketches of six—each of whom, we venture to think, is in every sense of the word “popular.” Sir Edward Burne-Jones has not only created a cult and gained a following of his own; he also pleases the ordinary connoisseur by the beauty of his line and by the richness of his color. Mr. Tadema—well, Mr. Tadema paints marble, blue sky, and blue sea as no other artist can paint them. Professor Herkomer’s versatility alone should make him popular, for is he not painter, carver, etcher, actor, author, lecturer, musician, and almost everything else besides? Mr. Luke Fildes painted “The Doctor.” Mr. Briton Riviere paints animals; whilst Mr. Hook depicts with skillful brush the rugged coasts and roaring waters of the sea-girt isle of Britain. Sir Frederick Leighton is not included in our list, because we dealt with him in the REVIEW just twelve months ago; Sir John Millais, whom a long illness has prevented from work during the past year, and Mr. G. F. Watts are reserved for more extended study hereafter.

I. SIR EDWARD BURNE-JONES, BART.

Sir Edward Burne-Jones shares with the President of the Royal Academy, and with Sir John Millais, the distinction of being one of the three “painter Baronets” of the period. The honor of a baronetcy has twice been offered to Mr. G. F. Watts, who has on each occasion respectfully but firmly declined it. No one will grudge it to any of the three artists named, least of all, perhaps, to Sir Edward, whose career, extending over thirty years, has always been marked by loyal and unswerving devotion to Art. A man of much individuality, of unimpeachable sincerity, and of great industry, he has carved out for himself a path of his own; he has not accepted, or followed, any particular style or school, but has rather created one. Free from any overwhelming desire to amass wealth, or to obtain dignities, he has for years worked patiently, steadily, and cheerfully at the profession of his choice, so that to-day he stands exalted above many of his brethren, and is prominent among that little band of Victorian painters whose names the world will not willingly let die.

BIRTH AND EDUCATION.

Sir Edward Burne-Jones had the good fortune to receive a first-class education. Born at Birmingham in the summer of 1833—that is to say, a little more than sixty years ago—he was at the age of eleven sent by his parents to the King Edward’s grammar school of that town, where he had for schoolfellows an eminent divine, the late Bishop Lightfoot, and Dr. Benson, the present Archbishop of Canterbury. Burne-Jones indeed was himself intended for the Church. But, happily for the world in general and for himself in particular, he escaped what has been

"CHANT D'AMOUR," BY BURNE-JONES.

called the "intolerable fetter of a white tie." In 1852, when nineteen years old, he gained an Exhibition at Exeter College, Oxford; and at the university he met a man who has undoubtedly influenced him greatly throughout the many years during which their close-knit friendship has lasted—William Morris. It was no doubt the future decorative poet and poetic decorator who urged upon the impressionable youth the special worthiness of a career in Art. Dante Gabriel Rossetti, whom he met in London in 1855, argued to the same purpose, and impressed young Burne-Jones so strongly as to cause him to leave the university without taking his degree, and to establish himself at 17 Red Lion Square, with Rossetti as his master, and William Morris as his friend and fellow-lodger.

"HERE ARE THE MATERIALS—PAINT!"

Rossetti had a very curious (many would say absurd) notion as regards the way in which an artist should be trained. "What is the use of setting a beginner to draw from the antique?" he would ask; "you may as well ask a child to write before he has learned to form his letters. Let him first learn to express himself, however haltingly, in his own way." Wherefore, after young Burne-Jones had watched and waited in the studio for a while, Rossetti put a palette and brushes in his hands, and said, pointing

to the model sitting before them, "Here are the materials—paint that boy's head." The young fellow did his best in these exceptional circumstances, and, crude as was the result, it won the approbation of the master, who bade him to persevere and to have no fears.

WAYS AND MEANS.

This was excellent advice in its way, but, meantime, Burne-Jones had to live. A young fellow of three and twenty cannot, like Ephraim, feed upon the wind. Rossetti was equal to the occasion. He got him, we are told, an order from the proprietors of the *Illustrated London News* to do a drawing in black and white of the "Burd Helen," by the pre-Raphaelite painter, Windus; but the order was rescinded. He also got for him his first commissions for stained glass windows from Messrs. Powell. He moreover introduced him to Mr. Ruskin, to Mr. Arthur Hughes, and to other artists; cheered him up when he felt low-spirited, and generally helped him by example and by precept along his artistic way.

A FEW PARTICULAR WORKS.

It is not possible here to do more than record the titles of some of Sir Edward Burne-Jones's more important works. These comprise "Venus' Mirror," "Chant d'Amour," "Laus Veneris" (the title, by the

bye, of one of his friend Swinburne's earliest and most characteristic poems), "Merlin and Vivien," "Pygmalion and the Image" (four pictures), "The Golden Stair," "The Annunciation," "The Wheel of Fortune," "Cophetua and the Beggar Maid," "The Tower of Brass," and "The Briar Rose" (a series of four pictures), as well as certain well-known water-color drawings, "The Wine of Circe," "Love Among the Ruins" (spoilt, alas! very recently, in Paris by some blockhead who could not distinguish between a water-color drawing and a painting in oils), "Temperentia," "Spes," "Fides," "Cantas," "The Days of Creation," "Dies Domini," "Spring," "Summer," "Autumn," "Winter," "Day" and "Night." He has also designed a number of cartoons for stained glass windows, five of which were executed between the years 1857 and 1860 by Messrs. Powell, while the remainder have been carried out by Messrs. William Morris and Company. His best known work of this kind is the St. Cecilia window at Christ Church College, Oxford.

PRAISE AND BLAME.

"To stand high is to be lied about"—a remark which, by the bye, cuts both ways. Few artists have met, on the one hand, with more idolatrous worship, and, on the other, with more bitter detraction than Sir Edward Burne-Jones. His pictures according to his friend and master, Rossetti, exhibit "gorgeous variegation of color, sustained pitch of imagination, and wistful, sorrowful beauty, all conspiring to make them not only unique in English work, but in the work of all times and nations." Monsieur Chesneau, a French critic of singular insight, regarded Sir Edward as the only artist "whose high gifts in designing, arranging and coloring are equal to his poetical conceptions." Others look upon his conceptions as morbid, archaic, and (what they are not) insincere. Mr. W. S. Gilbert alluded in "Patience" to the "greenery-yallery, Grosvenor Gallery" young man. About the same time *Punch*, in a parody of the late Laureate's "Palace of Art," described the "Mirror of Venus" as follows:

. . . Crowding round one pool, from flowery shelves
A group of damsels bowed the knee
Over reflections solid as themselves
And like as peasen be.

And in the "Beguiling of Merlin" (3,780 guineas) it saw:

. . . mythic Uther's diddled son
Packed in a trunk with cramped limbs awry,
Spell fettered by a siren limp and lean,
And at least twelve heads high.

"He laughs best who laughs last," and here Sir Edward clearly has the laugh on his side.

"HONOR, LOVE, OBEDIENCE, TROOPS OF FRIENDS."

For if any man ought to be happy, that man is Sir Edward Burne-Jones. A poet in the widest sense of the term, and a man of culture—his inspiration, it will have been observed, is derived mainly from the Bible, from romantic legend, and from classical poetry—he possesses a competence which enables him

to indulge his tastes to the full. He is happily married and has children. Honors have in recent years poured in upon him. He is a D.C.L. of Oxford; he has been decorated with the French Legion of Honor, and quite recently he was made a Baronet. He was for a time an Associate of the Royal Academy, and would, had he conformed to its rules and traditions as other artists have done, been made a full member. But he chose rather to treat the honor (if, indeed, he ever thought it one) which that body conferred upon him with contempt, and eventually resigned his position. In taking this step he no doubt acted wisely. A painter with such a striking individuality, and possessed of such remarkable powers, can scarcely be expected to be in full sympathy with the aims and objects of the body which reigns at Burlington House.

II. MR. ALMA-TADEMA, R.A.

Mr. Laurens Alma-Tadema is by birth a Dutchman. This fact explains much that is peculiar to his character and career. Bearing it in mind, we can understand the untiring energy and remarkable perseverance with which he has pursued the particular

ALMA-TADEMA.

branch of Art that he has elected to follow; we can excuse also the curious brusqueness of manner which at first blush is calculated rather to startle the stranger brought into contract with him. He ranks high in popular esteem, and, probably, there are few painters of to-day whose works sell more readily (whether in their original form, or reproduced as engravings) than his. He is a master of the art of per-

spective, and, as we have already observed, he paints marble better than any other artist now alive.

HE WOULD BE AN ARTIST.

Mr. Alma-Tadema, who was born at Dronryp, near Leeu Warden, in the ancient province of Friesland, on January 8, 1836 and who is therefore a little more than fifty-eight years of age—was destined by his family to follow the profession of the law. His father, who died when the boy was four years old, had been a lawyer; and they saw no reason why his fifth son should not be a lawyer also. It would be interesting to know how many living artists have been consecrated from the very beginning to the service of Art. The reason why no father thinks of making his boy a painter is, of course, obvious. The profession of Art, save in the case of men of distinction, is one of the most precarious and the worst paid in existence. The unsuccessful literary man can fall back upon journalism—so, for the matter of that, can the unsuccessful barrister—but the unsuccessful painter can fall back upon nothing. Hence the acute distress which perennially prevails within the profession. Fortunately for young Tadema, and for the world at large, his health broke down;

and his guardians, convinced of the fact that he had not long to live, determined to thwart his wishes no more. He was permitted to study Art, which he did at the Academy of Antwerp and in the studio of Baron Henry Leys, and with such success that in 1861—when only twenty-five years old—he produced his first important work, “The Education of the Children of Clovis.”

“THE EDUCATION OF THE CHILDREN OF CLOVIS.”

This work, according to one of his critics, contains most of the characteristics that have made Alma-Tadema famous. It has the Dutch minuteness of detail, the careful adherence to facts, the determination to give historical accuracy, as well as accuracy in the matter of accessories, purity of color and skill in the grouping of figures. It reproduces upon canvas an old Frankish story. Clotilde’s uncle had caused her father to be stabbed, and her mother to be drowned

with a heavy stone hung about her neck. She married the great King Clovis, and after his death sent for her little sons, and telling them not to “make her rue that she had brought them up with love and care,” bade them think with bitter hate of the foul wrong that had been done her, and “avenge the death of her father and mother.” Alma-Tadema shows us the Queen superintending that education which is to fit them to carry out the revenge. She gazes with motherly pride at her boys: the eldest of whom is hurling the axe, the second standing by waiting his turn, while the youngest nestles by her

“THE SHRINE OF VENUS.”—BY ALMA-TADEMA.

side, watching his elder brothers. There is a sadness in the set face of the Queen, which forbodes disaster. This work is now in the possession of the King of the Belgians. It belongs to the artist’s first period—to the years in which he mainly painted subjects illustrating German life in the early Middle Ages, and the Merovingian period.

EGYPT, ROME, AND GREECE.

Mr. Tadema next turned his attention to ancient Rome, to old Greece, and to a still older Egypt. It was while living in Brussels—where two daughters, one of whom is now an authoress and the other a water-color painter, were born to him by his first wife, whom he married in 1863—that the artist painted the superb “Tarquinius Superbus;” in which is seen the regal governor of men receiving certain meek emissaries from the city of Gabia, while in the foreground stands the mass of tall poppies, the proud-

est heads of which he is presently to mow off with his sceptre. This work was produced in 1867. He had, previously, in 1863—the year of his marriage—painted a picture which he called “Egyptians Three Thousand Years Ago,” and which a distinguished Egyptologist has described as a “true resurrection of Egyptian life.” To this same period belong the “Death of the Firstborn,” “The Egyptian at his Doorway,” and “The Mummy.” It was in 1868 that Mr. Tadema painted “Phidias and the Elgin Marbles,” in which is seen the sculptor after he has completed the Parthenon frieze, that supreme and unsurpassable triumph of plastic art. The figures of Phidias himself, and of Pericles, Alcibiades and Aspasia, all form part of the composition.

ENGLISHMAN AND R.A.

In 1870, Mr. Tadema, having lost his wife, came permanently to reside in England, where, in 1871, he married an English lady, who has since distinguished herself as a painter of children. There is no need to follow his career for the last twenty-four years in detail, or even to set forth a list of his more important paintings. The latter are familiar, in the shape of engravings, to everybody who lingers outside print-sellers’ windows; while the former has for the most part consisted of incessant but uniformly successful toil. The Royal Academy made him an Associate in 1876, and he became a full R.A. three years later. He is also a foreign knight of the *Ordre pour le Mérite*—Frederick the Great’s Order—just as Carlyle was, and as Sir Frederick Leighton and Sir John Millais now are. The Emperor conferred this distinction upon him in 1891.

METHODS OF WORK.

Painstaking, industrious, accurate, methodical, almost fastidious at times, Mr. Tadema strives with all his might to reach in every picture that comes from his hand the high standard which he has set up for himself. No pains are at any time spared, no sacrifice is considered too great. He will make studies innumerable, if thereby more accurate results are to be obtained; and he will, without compunction, wipe out a finished figure from his canvas, if its absence in any way improves the composition as a whole. “His first sketch,” says his sister-in-law, Mrs. Edmund Gosse, “is usually done slightly and directly on the canvas or panel. The groups of figures are arranged and rearranged until the artist’s eye is satisfied that the whole composition hangs well together, and that the attention of the spectator is carried naturally along to the chief incident of the scene. All the sketching in of the figures is done with the help of nature. A thin oil-color outline of some neutral color is used for this; sometimes the figures are painted at once. The whole canvas is now filled in, rather as a piece of *cloisonné* might be, with color, so that the disturbing whiteness of the material is hidden. Hard work follows.”

HIS ESSENTIAL MODERNITY.

Although Mr. Tadema’s subjects are drawn almost exclusively from the life and history of the past—he

has, by the bye, painted several excellent portraits, the most notable being one of Paderewski—nevertheless his works are essentially modern in their character. Sir Frederick Leighton aims at presenting ideal beauty; Mr. Tadema is content to infuse life and spirit into the scenes and events of long ago. “Remember,” he will say, “we are after all the descendants of antiquity. The times change, but human nature does not change with them. And so, whether it is Pharaoh weeping over his dead son’s body in an Egyptian temple, or a Roman lady chaffering with a Tiber boatman over his fare for ferrying her across the river, or a Greek youth reading Homer by the shore of the much-roaring sea, I endeavor to throw into each something of that life which I best know—the ever-throbbing life of the great city which lies around us.”

THE ANTIQUE WORLD IN SLIPPERS AND DRESSING GOWN.

To use the language of Monsieur Chesneau, Mr. Tadema “invests antiquity with the familiar gait, gestures, movements and attitudes of to-day. As a protest against the false dignity and commonplace stiffness which the impotent pedantry of academies has introduced into their formal dramas and heroic poems, Alma-Tadema has, in a manner, put the antique world into slippers and dressing gown. He represents his heroes as walking, sitting, rising, drinking, eating and talking, not as the characters walked, sat, rose, drank, ate and talked in the theatre of Talma, and in the tragedies of Lebrun, but as we ourselves walk, sit, rise, drink, eat and talk.” Herein lies the secret of Mr. Tadema’s popularity—a popularity to which the noble and luxurious mansion which he has reared for himself in St. John’s Wood bears eloquent and irrefutable witness.

III. MR. LUKE FILDES, R.A.

Mr. Luke Fildes is a fortunate man. He has the distinction of having begun his career as the illustrator of Charles Dickens’s last novel, “The Mystery of Edwin Drood;” he has painted the most popular picture of recent years, “The Doctor” (exhibited in 1891); and he was chosen last year to reproduce for posterity the features of the fair and gracious princess who will after the demise of the reigning sovereign share the Imperial throne.

“DO SOMETHING GOOD.”

This, by the way, is Mr. Fildes’ jubilee year. He was born at Liverpool in 1844. Thence he came to London, as most aspiring young men do when they get the chance, and in 1863 entered the South Kensington Art Schools as a student. Three years later he migrated to Burlington House, where he worked under supervision for a considerable time. His first “chance” came to him in the year 1869, and he took it. Mr. Thomas having planned the London *Graphic*, wrote to young Fildes and asked him to do “something good” for the first number. The artist was greatly elated, said he would do what he could, and

forwarded a sketch which had the place of honor on the opening page of the first number of the new journal. It was a picture of a number of "casuals" applying for tickets for the ward at the police station. "When I received the commission," remarked Mr. Fildes, in the course of a conversation some years ago, "I remember going to my lodgings, tumbling into an easy chair, and wondering what I should do. I thought and smoked, walked about the room, when suddenly I remembered being very much struck by the terrible pathos of a sight which I had seen in my nightly wanderings in the streets. I had been to a dinner party, I think, and happened to return by a police station, when I saw an awful crowd of poor wretches applying for 'permits' to lodge in the casual ward. I made a note of the scene, and after that often went again, making friends with the policeman, and talking with the people themselves. That was my chance, and I at once began to make studies for my *Graphic* picture."

"APPLICANTS FOR ADMISSION TO A CASUAL WARD."

The black and white sketch was, some three years later, elaborated into a large canvas, which proved to be the picture of the year at the Royal Academy exhibition of 1874. In it you are shown a crowd of shivering wretches—"all sorts and conditions of men" and women—the leering, indifferent loafer, the bloated drunkard, the family that has just been sold up and forced to seek the grudgingly-given hospitality of the streets, father, mother, and children forming, involuntarily, a pathetic group, and the policeman instructing a man who has evidently seen better days how to obtain admission to the ward. The rain, which is pouring down in torrents, is swept by the wind into the faces of the miserable crowd. Behind are the grim walls of the police station, the gloom of which is heightened by the flickering light of a dim lantern hung over the door. "Some of

LUKE FILDES.

these folks got to know me in time," Mr. Fildes will tell you, "and I used to ask them to come round to my place for a job, and so I got them to sit to me."

CHARLES DICKENS.

It was in the autumn of 1869 that Charles Dickens began to write his last, and unfinished, novel, "The Mystery of Edwin Drood." He was anxious to get some good black and white man to illustrate it, and he consulted certain artistic friends of his, Mr. W. P. Frith and Mr. John Millais among others. They could not recommend anybody. Then the first number of the *Graphic* came out with young Fildes' sketch, and at once they exclaimed, "Here is Dickens's man." They showed the distinguished novelist the picture, and he at once sent for the artist. Mr. Fildes, who had revered Dickens from his youth up, was delighted, but he found the great man rather awkward to work with at first. He was, for one thing, exceedingly anxious that Jasper should be shown stealing up a narrow staircase one black night, "with fell purpose on his face." The situation was striking, no

From a copyrighted engraving by Goupil & Co.

"THE DOCTOR."—BY LUKE FILDES.

doubt, but it did not necessarily lend itself to treatment at the hands of the illustrator. Fildes told Dickens so, and after a long argument the novelist yielded, and thenceforward allowed him to select his own subjects.

PORTRAIT OF THE PRINCESS OF WALES.

Some ten years ago Mr. Fildes changed his style almost entirely. The influence of Charles Dickens passed away, and he ceased to paint with a purpose. He went to Venice, where brightness, vivacity, gorgeous colors, and brilliant skies caused him to forget the sombre subjects with which he had been in the habit of dealing. He discovered about the same time

1887. His chief distinction as a painter, however, is that he has twice produced *the picture of the year*: "Applicants for Admission to a Casual Ward" (1874), and "The Doctor" (1891).

IV. MR. J. C. HOOK, R.A.

Mr. James Clarke Hook, R.A., is a Grand Old Man among painters. He is seventy-five years of age, yet his perception is as keen and his touch as firm as it was when he became a Member of the Royal Academy thirty-four years ago. Hook was born in the year 1819. His father was the Judge Arbitrator of certain courts in Sierra Leone, whilst his mother was a

"LUFF, BOY!"—BY HOOK.

that portrait painting (provided that you have plenty of commissions) is at once a pleasant and a lucrative branch of the profession. Hence, of course, the red-brick palace in the Melbury Road, hard by the residence of the President, and those of Messrs. Watts, Val Prinsep, Colin Hunter, Marcus Stone and Thornycroft; hence also the almost unique honor of having been commissioned to paint a portrait of the Princess of Wales. Her Royal Highness, who wears a simple costume of black tulle, is represented in this portrait as sitting upon a sofa, red hangings forming a background. The expression of her face is thoughtful, if not, indeed, almost sorrowful. A silky-haired Japanese pug lies at his royal mistress's side. This portrait is now on view at Burlington House. Mr. Luke Fildes, we may add, was made an Associate of the Royal Academy in 1879, and a full Member in

daughter of Dr. Adam Clarke, the biblical commentator. The boy's predilection for art showed itself while he was at school, where he gained a prize for a drawing of a head in 1833. Leaving school he got an introduction to Constable, who from time to time gave him assistance and advice. He also studied in the British Museum, sketching the Elgin marbles with much diligence and care. He next became a student at the Royal Academy, where he won the Gold Medal (1836), and subsequently carried off that "blue ribbon" of the schools, the traveling studentship. He then married and went to Italy.

PICTURES OF THE SEA.

For a considerable time after his sojourn in Italy, Mr. Hook painted mainly subjects inspired by French and Italian history and poetry, as well as a few sug-

gested by the Bible. These need not concern us greatly ; inasmuch as it is by reason of his sea-scapes—"Hook-scapes" somebody once called them—that he is popular, and that his fame as a painter will live.

J. C. HOOK.

Another thing, he discovered Clovelly, the quaint old North Devon fishing village which Charles Kingsley used always to describe as the most beautiful place in the whole world. Mr. Hook went there in 1854, just a year before the publication of Kingsley's "Westward Ho!" "Welcome, bonny Boat!" and "A Fisherman's Good-night" were the earliest outcome of this visit. Next, he painted some rural scenes, and then the sea—and Clovelly—once more inspired him. Perhaps the most remarkable work belonging to this period is "A Coast Boy Gathering Eggs." The scene is Lundy, a small island off the weather beaten coast of North Devon. A boy who is being let down before the face of a cliff by a rope, holds a net at the end of a rod to receive the spoils of his cruel business, some of which have been lodged in a nook near at hand. A hundred yards below the boy's feet lies the summer sea, which, breaking at the cliff's base, makes a silver fringe of foam. On the ledge above the robber, his comrade, a young man, grasps the sustaining rope. "Vivid, various, and harmonious" is the verdict of a sympathetic critic upon this very striking work.

A PICNIC IN SURREY.

It is not necessary to our present purpose to transcribe the titles of many works of this character that have come from Mr. Hook's hand ; it will be enough to say that he has been, and still is, represented yearly at the Royal Academy's summer show. It is a little curious to note, however, that his sea-scapes are for the most part painted in a Surrey village.

"You paint better," he will tell you, "if you are not always in the midst of your subject." Mr. Hook settled in Surrey as far back as the year 1857. The Etching Club, of which he was a member, had a picnic at Hambledon, and he was so struck with the quiet beauty of the place that he determined to let his house in London and to live there. Of this picnic the painter tells an amusing story. The party was a jolly one, and when in Godalming they caught sight of a countryman's yellow waistcoat in one of the shops, they bought it. Next they urged Creswick to wear it at lunch, which, to their infinite amusement, he did. Then they tossed for it ; Hook won it, and used it afterward as a wedding garment in his pictures of village life. The painter now lives at "Silverbeck," a house which he built for himself some years ago near Churt.

A FEW CHARACTERISTICS.

The Grand Old Painter concerning whom we write can handle other things besides the brush and the palette knife. Like another Grand Old Man, he can fell trees ; he can also dig, plow, mow, or wield a flail ; he can, moreover, row, or stand at a tiller, or control a suit of sails. His wiry, broad-shouldered, muscular figure and ruddy countenance testify to a healthy life, and to almost constant exposure to air and sunlight. A staunch Wesleyan, who has done much for the cause in the Farnham district in which he resides, he is also in warm sympathy with the Salvation Army. An earnest Radical, he has the most profound hatred for what he calls "Brummagem stuff." Those who wish to become acquainted with his art may do

BRITON RIVIERE.

so by visiting Burlington House any day these three months.

V. MR. BRITON RIVIERE, R.A.

Mr. Briton Riviere, the acknowledged prince of English animal painters, was born, so to speak, in an atmosphere of art. There was not for a moment any question as to what profession he should follow. Not only had both his grandfather and his father been students at the Royal Academy, but the latter was, at the time of young Riviere's birth, head of the drawing school at Cheltenham College. The boy, therefore, was taught to use the implements of the artist from the very beginning. There exists, according to Mr. Walter Armstrong, a pencil drawing of a wolf's head made at the Zoo when he was only seven years old, which not only displays extraordinary dexterity for so young a child, but shows also a faculty for grasping the distinctive character of an animal, which has persisted through the whole of his life. Another proof of his remarkable precocity is to be found in the fact that when only eleven years old he sent two pictures to the British Institution, both of which were hung. Six years later, when little more than seventeen (the date was 1858, and Mr. Riviere was born in 1840), he had three pictures in the Royal Academy. "Sheep on the Cotswolds," "Tired Out," and "Monkey and Grapes." Then he walked for a few years in the steps of the pre-Raphaelites, losing rather than gaining thereby. His career as an artist really began in 1864, from which year up to the present time he has worked steadily and successfully in a field that he has made peculiarly his own.

"DANIEL," "PERSEPOLIS" AND "NIMROD."

"Daniel," Riviere's first great picture, was exhibited at the Royal Academy in 1872. The prophet, his hands tied behind him, stands in the lions' den, facing a group of seven ferocious beasts. The particular moment, we may assume, is that immediately following his incarceration. The fierce animals rage

"GANYMEDE."—BY BRITON RIVIERE.

impotently at "God's judge," who looks at them, erect and immovable as a Persian pillar—a striking contrast to the passions which seethe around him. This work is regarded by many as the painter's masterpiece. "The Ruins of Persepolis"—another famous example—illustrates a couplet from that saddest of Oriental poems, the "Rubáiyát" of Omar Khayyám. "They say"—so the lines run in Fitzgerald's translation—

They say the Lion and the Lizard keep

The Courts were Jamshyd gloried and drank deep.

Night, moonlight, picturesque and historically interesting ruins, four prowling lions, and some half-

aroused lizards—these are the main features of this very striking work. “A Mighty Hunter before the Lord” was exhibited at the Royal Academy as recently as 1891. It is a triptych, and the largest composition, the middle one, represents an incident of the chase. Nimrod stands erect in his chariot, which is being urged at full speed across the sandy tracts of the desert. Behind, clawing the ground in her agony, lies a wounded lioness, the head of the fatally-aimed arrow protruding from behind the shoulder. The lion, who has bounded after the chariot, has got his claws caught in the leather-work. Nimrod, seeing at once his danger and his opportunity, plunges his spear into the animal’s body. The two wings of the triptych shows us the result of the day’s sport. The hunted beasts lie, dead or dying, in the intense solitude of the desert, alone save for the yellow stars which look down pitilessly from the arched vault of the heavens overhead.

VI. PROFESSOR HUBERT HERKOMER, R. A.

If you want to see Professor Herkomer, the painter, at his best, go to the South Kensington Museum and ask to be directed to the gallery in which the pictures bought by the President and Council of the Royal Academy under the terms of the Chantrey Bequest are, for the time being, exhibited. There you will find “The Chapel of the Charterhouse”—in all probability it will be the first work to compel your attention—and, unless you are absolutely devoid of feeling, it will impress you more than any other picture in the collection. It is a work which displays at once the pathos of sorrow, the dignity of suffering, and the nobility of reverse. Those who have read Thackeray’s “Newcomes”—and those who have not are hereby adjured to do so forthwith—will know all about the Charterhouse and its famous chapel. It is a quiet haven for gentlemen whom the cruel tide of receding fortune has left high and dry on the rocks in the last hours of declining day. In Herkomer’s picture they are seen sitting in the quaint old pews: whilst one—whom we may imagine to be old Colonel Newcome himself—walks slowly up the aisle. The work is, in truth, an illustration of a verse from the Psalm always read on Founder’s Day—the thirty-seventh—

The steps of a good man are ordered by our Lord: and he delighteth in his way.

Though he fall, he shall not be utterly cast down: for the Lord upholdeth him with His hand.

Another of Professor Herkomer’s paintings—a landscape entitled “Found”—is on view in the same gallery, while yet another, a more recent example, called “On Strike,” may be seen any day in the Diploma Gallery at Burlington House.

“SEI EHRlich UND FLEISSIG.”

“Sei ehrlich und fleissig” (be honest and industrious) and “Peace and Success”—here, in two phrases, you have summed up for you the whole of Professor

Herkomer’s career. The phrase was addressed by the painter’s grandfather to his second son when he apprenticed him to a joiner in Waal; the second is Professor Herkomer’s summing up of his own existence. His life has been a very eventful one—as eventful, almost, as that of David Copperfield. Born in humble circumstances—his father, Lorenz Herkomer, was a “Tischler-Meister” (master joiner)—he, together with the rest of the family, was for years in a more or less poverty-stricken condition. Blessed with gifts superior to those which the gods usually bestow upon the sons of men, he had to wait long and patiently for opportunities to exercise them to any advantage. His father determined from the very first that the boy should be an artist. “This boy shall be my best friend, and he shall be a painter,” he is said to have

HUBERT HERKOMER.

remarked when the lad was born in 1849. Professor Herkomer became both. His filial devotion to his father and his tender affection for his mother are said by his friends to have been of the rarest and noblest kind, while his position as a painter is, as everybody knows, acknowledged and assured.

BREAKING HIS BIRTH’S INVIDIOUS BAR.

The difficulties which encounter the man who, to quote Tennyson’s lines:

. . . breaks his birth’s invidious bar,
And grasps the skirts of happy chance,
And breasts the blows of circumstance,
And grapples with his evil star,—

are almost inconceivably great. But, thanks to genius and to an inflexible will, young Herkomer overcame them. His humble origin, the poverty which surrounded him as a boy, his lack of influential friends, his unhappy first marriage—all these things

were bravely met and conquered. But the struggle was a fearful one, and there were rebuffs which would have discomfited a less energetic man than the Professor.

MR. W. L. THOMAS OF THE "GRAPHIC."

Happily for English art, Herkomer received a very different reception from Mr. W. L. Thomas of the *Graphic*—a man to whom many eminent English painters owe much of their success. "Gipsies on Wimbledon Common" was the subject of the block which the artist took to him. Mr. Thomas cordially shook hands. The drawing was good, he said, and he accepted it there and then, saying he would be very pleased to take any amount of such good work. Herkomer thrilled with excitement and joy, and after receiving \$40 for the block, from that moment never lacked remunerative work. Wood engraving, water-color drawing, oil painting, and travel thereafter absorbed the artist's attention for some time. By the year 1872 he had saved \$1,000, and he determined to give his father and his mother a real holiday. He collected all the money in gold to show his mother,

and they placed it in little piles on the table as they counted it. No money ever brought him greater happiness.

HIS MARVELOUS VERSATILITY.

Herkomer's most striking characteristic is his marvelous versatility. A more many-sided man it would be impossible to meet. As a painter he stands in the very front rank—his work evoking the warm enthusiasm both of the public and his brother artists; as a teacher of art he is almost unrivaled, his school, or "colony," at Bushey being one of the most successful organizations of the kind in existence; as an etcher (he taught himself the art) he has won high praise both in this country and abroad; as a lecturer, he is well equipped, spontaneous, and entertaining; as a composer of music he is, according to Herr Richter, "never commonplace, and nearly always original;" while both as an executant of music and as an actor he has won much applause. And he is as industrious as he is versatile. No wonder then that he is in a position to say, as he said five years ago, "My existence is summed up in the two words, 'Peace and Success.'"

"HARD TIMES."—BY HERKOMER.

A GROUP OF AMERICAN ECONOMISTS.

LEADING ARTICLES OF THE MONTH.

ECONOMIC SCIENCE IN AMERICA.

IN the *University Extension Bulletin* Mr. Edward T. Devine, Ph.D., writes on the subject "Economic Science in America." This article is published *apropos* of the Summer Meeting of the American Society for the Extension of University Teaching, at which will appear as lecturers and instructors representatives of the various phases of the new economics which since the seventies has swept like a wave over America. Until 1876, says Dr. Devine, there had been in the economic thought of the United States two distinct and antagonistic schools, the orthodox English system and the native American economics. The first of these schools had its chief interpretation in the translation of the political economy of J. B. Say, though there were American editions of the "Wealth of Nations," and the works of Ricardo, Malthus and McCulloch were familiar to students. After 1848, Mills' political economy to some extent supplanted that of Say as the standard text-book. The native school dates from Henry C. Carey, the Philadelphia economist, whose first book appeared in 1835. The orthodox political economy, strongest in the New England colleges and in the South, stood for hard money and free trade. The economics of Carey stood for protection and expansion of the currency. The former was in harmony with the natural conservative temper of the English race. The latter was an expression of the spirit of enterprise called forth by the American people, or better, perhaps, forced upon them by economic conditions.

GENERAL WALKER'S LEADERSHIP.

"Such," continues Dr. Devine, "was the general tone of economics in America when in 1876 Gen. Walker published his 'Wages Question.' This and the 'Political Economy' of 1883 mark a new epoch. General Walker would doubtless prefer to be classed, if a classification is necessary, with the orthodox school of economists. He does not break with its earlier representatives on what they would have regarded as fundamental questions. His book naturally displaced Mill as the ordinary text at Oxford and Cambridge. Even in the discussion of distribution where Walker proposes his most radical departures, he starts with the Ricardian doctrine of rent, and declares, explicitly, that on this question he is a 'Ricardian of Ricardians.' Nevertheless the appearance of these books in America mark the close of a long and, with the exceptions that have been noted, an almost barren epoch. Several text-books, a few of them excellent for their purpose, had been prepared by American writers, but whatever originality they contained appeared chiefly in the omission, from the reproduction of the orthodox system, of particular dogmas which were felt to be inconsistent with the industrial conditions with which the writers were

familiar. Unlike his predecessors General Walker did not merely omit—he examined and analyzed those conditions, and when he was compelled to form new conclusions he neither attacked the old system entire, because of its errors, nor made the mistake of regarding his discoveries as slight modifications of detail. It has become clear that the changes were important, though they were not revolutionary."

INFLUENCE OF GERMAN UNIVERSITIES.

Almost immediately after Mr. Walker's views became known a new influence worked its way into American economics. So widely had General Walker and Mr. David A. Wells aroused interest in econom-

GEN. FRANCIS A. WALKER,

First President of the Amer. Economic Ass'n.

ics that the universities were unable to meet the demand for competent guidance in these studies, and students began to seek such instruction abroad.

"The greater hospitality of the German universities, the unrivaled reputation of the founders of the German historical school of economics, and a feeling that more would be gained by foreign residence in a country whose institutions differ radically from our own were among the causes that combined to attract the American students almost exclusively to the Ger-

man universities. Within a few years the American colleges began to give evidence of the new movement in the expansion of the curricula, the founding of new chairs and the increase of students. The English influence had been communicated by the importation and republication of books. The German influence came through personal channels. This difference in the method of communication accounts in part for the astonishing difference in results. In the case of the English communication there were at hand standards of orthodoxy, a 'system' in crystallized form. In the college classes there was produced a real conviction of the correctness of certain principles and dogmas. In the case of the German influence such standards were lacking.

IMPULSE RATHER THAN SYSTEM.

"Each new doctor of philosophy brought back the ideas of his instructors and associates in the foreign

DR. RICHARD T. ELY,
First Secretary of the Amer. Economic Ass'n.

universities not in a formulated exact system, but in the form in which they had been impressed upon himself. He brought not so much a system of economics as an enthusiasm for independent research. The result is that no 'system' has been transplanted by the newer economics, but only tendencies and a quickening impulse to activity in every branch of economic investigation, and already the impulse is seen to be of more importance than the particular tendencies.

THE AMERICAN ECONOMIC ASSOCIATION.

"When the American Economic Association was formed in 1885, as a tangible evidence of the new

birth, a platform was adopted committing the association, though not the individual members, to favor increased industrial activity in the State, increased emphasis on the ethical element in economics, and increased attention to the historical method as distinguished from the deductive method which some of the leaders of the new organization believed to have been responsible for the decay of interest in economic science. But this platform was found to be too narrow, and in a few years it was discarded for a simple statement that any one might be chosen a member who is interested in the study of economics. General Walker was elected the first president of the association and continued in that office until 1892. Dr. Richard T. Ely, who served as secretary until the same year, labored indefatigably in the interests of the association, building up its membership and also for a time editing its publications. In 1893 Professor Charles F. Dunkar, of Harvard, became president, and Professor Edward A. Ross, then of Cornell, secretary, and for the present year Professor John B. Clark, of Amherst, is president, and Professor J. W. Jenks, of Cornell, the secretary of the association. Professor F. H. Giddings succeeded Dr. Ely as chairman of the publication committee, a position which is held at present by Professor H. H. Powers, of Smith College.

ECONOMICS IN THE COLLEGES.

The seven annual meetings of the American Economic Association have served as milestones of a rapid development of the science. Its position in the universities as a regular discipline of the university curriculum has become every year more secure. Thirty or forty professors and assistants are engaged in teaching its principles. Schools of finance and economy, departments of political and social science, lectureships on special economic topics abound. Every college has either an independent chair of political economy or a combined chair of economics and history or some other subject. The larger universities have now organized and in some instances liberally endowed these departments until they rival the best equipped corresponding departments of German, French and Italian universities. The movement which began in the seventies by sending dozens of students across the Atlantic, already bears fruit in courses of study sufficiently attractive to hold at home scores of students quite as ambitious and as discriminating.

There must be noticed finally a new movement coming in part from the Austrian economists, in part from the English economist Jevons, and in part originating with native American writers, a movement which has been pronounced by some critics reactionary, but by its friends the most promising of all the various phases of our economic thought, the movement in the direction of deductive theory. Professor Patten's "Premises of Political Economy" and Professor Clark's "Philosophy of Wealth," published respectively in 1885 and 1886, were its first fruits; and abundant evidences of its subsequent

fruitfulness are to be found in the monographs of the Economic Association, in articles published in economic journals and in the later literature generally.

THE STUDY OF SOCIOLOGY.

One group of writers belonging with the newer movement, but devoting its energies directly to sociological studies, gives promise of rescuing that much misconceived branch of study from the hands of its injudicious representatives and putting it upon a high scientific plane. Professor F. H. Giddings, who will become Professor of Sociology in Columbia College on July 1 of the present year, is the foremost scholar of this group, and the first man in any American university to occupy a chair with this designation. The future of economic science in American universities is bright with promise of scholarly and useful work

PRESIDENT ELIOT'S TWENTY-FIVE YEARS OF SERVICE.

ONE of the leading educational articles of the month is President Thwing's estimate, in the *Forum*, of "President Eliot's Twenty-five Years of Service." The President of Adelbert College is appreciative of the good work which the President of Harvard has accomplished, and seeks to point out the place which that distinguished university administrator occupies in the educational field of America. To abstract from President Thwing's article: President Eliot, like his predecessor, Quincy, regards the administration of a university as a business. He is not like Hopkins, who for thirty-six years was president of Williams College, first a great teacher, and secondly, administrator. He is not like Porter, of Yale, first an author, and secondly, administrator; nor is he like Mr. Porter's predecessor, Woolsey, first a scholar, and secondly, an administrator. Rather he is first, last and only a university administrator. In a word, President Eliot illustrates the fact of making the college presidency a business, and to the doing of this business he brings a vigorous and impressive personality, distinguished for moral and intellectual parts. The intellectual side is more conspicuous and dominant, but the will of this personality is more conspicuous and dominant than the intellect, calling to mind the remark of Schopenhauer that the normal man is two-thirds will and one-third intellect.

THE SECRET OF HIS SUCCESSFUL ADMINISTRATION.

After pointing out that President Eliot's power lies in dealing with the students as a body rather than with the individual student, President Thwing then considers what he regards as one of the most important points in Dr. Eliot's entire administrative career, namely, his relation to the community. It is right here, he says, that one finds the secret of his administration: "This is, that he has kept himself and the university in vital touch with the community. He has co-ordinated it with the other social, commercial and educational forces of the time. He has

made it a university for the men who are to rule affairs in the last years of the present and the first years of the next century,—a university for citizens of the United States. President Eliot himself says: 'It is the principal function of a university to train leaders,—men who have originating power, who reach forward, and in all fields of activity push beyond the beaten paths of habit, tradition and custom.' This intimacy of relationship between the community and the university has not resulted from an appeal to prejudice, or to any unworthy principle of human life or character. It has resulted from a constant and impressive recognition of the highest elements in humanity. The President himself has set up the

PRESIDENT ELIOT, OF HARVARD.

standards to which the community ought to come, and he has done much toward bringing public sentiment and action up to these standards.

"No work of the university represents more closely the endeavor to put itself into touch with the best life of the community than the recent history of its two largest professional schools, those of medicine and of law. The state of the best of these schools in the last half of the seventh decade of the century was bad. Most of them were proprietary. The course of instruction covered only two years; and in each year of the medical school the chief instruction was given in a 'winter term,' covering only the shortest days and the longest nights of the calendar year. The law schools were not so wretchedly off as the medical; but they admitted almost every applicant, and the requirements for receiving the degree of

bachelor of laws were notoriously lax. The community more easily appreciated the danger of turning loose upon itself hundreds of ill-trained doctors than of ill-trained lawyers. Therefore the improvement of our medical schools preceded and is still preceding the improvement of our law schools. The lengthening of the term to four years, the increasing severity of examinations, the larger introduction of clinics and of laboratory work, are only the endeavor to cause the university to minister more simply, more powerfully and more constantly to the welfare of the community. This improvement President Eliot has probably been more instrumental than any other in bringing about. The secret of President Eliot's administration lies, then, in putting the university in touch with humanity itself, and one cannot doubt, says President Thwing, that this movement is already having two results: 1, It is increasing the variety of callings which graduates may enter, 2, is tending to extend the geographical range whence students come to college.

A NEW TYPE OF UNIVERSITY PRESIDENT.

"President Eliot is the first example in our time of a new type of university president. It is well that this example should be so magnificent. One can hardly help comparing this best representative of the new with the best representative of the old. This representative is President Hopkins. President Hopkins and President Eliot stand alike for virility, mighty personality, wisdom, comprehensiveness of plan, devotion to duty, and greatness of desire to benefit their fellow-men. But President Hopkins touched men as individuals, President Eliot touches them as a body. President Hopkins was first and last a teacher; President Eliot is first and last an administrator, a man of affairs, an executive. President Hopkins was concerned with men; President Eliot is concerned with means, measures, methods. President Hopkins avoided opposition by removing its causes, or melted opposition by the warmth of his character; President Eliot beats into pieces the icy blocks of opposition by the sheer blows of his mighty will. President Hopkins was distinguished for wisdom; President Eliot is distinguished for strength. The one was the more discreet; the other was the more fearless. President Hopkins elevated the moral and religious above the intellectual, or rather permeated the intellectual with the religious and moral; President Eliot emphasizes more the simple intellectual. President Hopkins began on the moral and religious basis, and so continued; with President Eliot the moral and religious basis has become more conspicuous with the passing years. President Hopkins's baccalaureate sermons treat of man's duty to God; President Eliot's farewells would relate—were they formally spoken—more to a man's doing his duty in this world. President Hopkins's teachings and counsels were religious; President Eliot's are more ethical. The like of President Hopkins we shall not soon see again, and may the need of trying to see one who shall be sufficiently like and sufficiently

unlike the present President of Harvard College to continue his work be remote."

ATHLETICS AND SCHOLARSHIP.

How Iowa College Regulates Athletics.

THE problem of how to regulate athletics in colleges so as to conserve physical energy without impairing scholarship appears to have been successfully solved by the students of a Western college. In the *Midland Monthly* Mr. Henry Smith McCowan tells us that recently the students of Iowa College inserted in the by-laws of their athletic association a provision denying the privilege of entering any competitive athletic sport to those falling below a stipulated grade in classroom work: "Those who would otherwise be poor students are compelled to maintain a respectable average with the class. This effort to make athletics subservient to scholarship is the project of the students, and is an evident outgrowth of the self-governing principle of the institution. Of course, the faculty warmly approve such a plan, for they, too, are ardent supporters of athletics so long as the practice does not interfere with study. After the closing game of football for the season of '93, in which the championship of the State was again won for Iowa College, President Gates, in behalf of the faculty, presented Elston F. King, the captain of the team, with a beautiful gold football watch charm, thus showing their appreciation of diligent application in physical as in mental culture. This responsive sympathy between faculty and students has created a fine independence and has found an admirable equilibrium between books and sports with almost no friction. And this is not strange, for tolerant independence is the secret of harmony. Thus Iowa College has built up a reputation for scholarship and athletics hardly equaled by any other Western institution."

MILITARY TRAINING IN SCHOOLS.

T. B. BRONSON, in the *School Review*, sets forth some of the advantages of military discipline as a factor in the school life of boys. "Military discipline and drill are found to be of great assistance in preserving good government, in holding the student's attention to study, and in sharpening the intellectual faculties. There results an increased excellence in academic work. Obedience and a proper respect for authority become second nature. The cadet in learning to obey develops in himself that rarest and most precious gift, the power of self-control, which marks the noblest type of man. Moreover, there is a charm and an incentive in a military atmosphere that appeal to the most sluggish nature and inspire one to increased effort to excel. Hence it is that many indifferent students, on passing from a common school to a military institution, surprise their former teachers and acquaintances by earnest application and brilliant results. Rank and office being the reward for good deportment and scholarship, the student is impelled by a motive power not existing elsewhere. The cadet

officer in performing his duties, in commanding and in directing his fellows, learns lessons that will be of lasting value to him in after-life. Both as officer and as private the cadet learns to attend carefully to matters of personal neatness and exemplary deportment. There is no other system by which are instilled so thoroughly order, patience, punctuality, cheerful obedience, respect for one's superiors, and a sense of duty, honor and manliness.

GOOD FOR BRAIN WORK.

"Under a system of military education it would seem that there must be a loss in the time and energy available for the usual academic work. Experience shows that the very opposite is true. It is seen that the time devoted to military instruction and exercise is more than compensated by the increased mental activity and vigor of the student. His attention is sharpened and his intellect quickened. He is more alert and can acquire more in a given time. It is not every youth who is studious by nature and who acquires knowledge from the love of acquiring. To accomplish the best results the young student should be placed in surroundings favorable to industry: he should breathe a busy atmosphere. In the common school, left to himself to regulate his hours of study, and exposed to the innumerable temptations of society and good-fellowship, the pupil unconsciously or heedlessly loses valuable time. In a military school it is otherwise. Life is regular as clock-work. Not only recitation and drill, but also recreation, study, and even sleep have their allotted hours. In this way the pupil learns method and acquires good mental habits."

THE MOST NOTABLE SAYINGS IN ENGLISH HISTORY.

THE *Leisure Hour* offered prizes for wise sayings connected with historical events. In the May number the editor awards the first and second prizes, both of which are won by women.

He says: "A careful analysis proves beyond all doubt that the most popular instances of wise sayings connected with history are the following:

"*Oliver Cromwell's*: 'Put your trust in God, but keep your powder dry.'

"*Cardinal Wolsey's* dying words: 'Had I but served my God as diligently as I have served my king, He would not have given me over in my gray hairs!'

"*Latimer to Ridley* at the stake: 'We shall this day light such a candle, by God's grace, in England as, I trust, shall never be put out.'

"*Sir Robert Walpole* in the declaration of the war with Spain: 'They may ring their bells now, but they will soon be wringing their hands.'

"*Nelson's*: 'England expects every man to do his duty.'

"*Wolfe* at the Heights of Abraham, repeating the stanzas of Gray's 'Elegy': 'I had rather be the author of that poem than take Quebec.'

"*Sir Walter Raleigh* at his execution: 'What matter how the head lie, so that the heart be right?'

THE STRUGGLE FOR WOMAN'S RIGHTS.

LADY COOK recounts in the *Westminster Review* some important details in the history of marriage, showing the evolution of certain privileges now generally conceded to women. Speaking of women at the dawn of civilization, the writer says:

"They now were a sort of cattle, bought and sold, exchanged and lent, just like any other chattels. Next dower supplanted purchase, and she began to possess legal rights, sometimes to obtain the mastery over the husband. Her jubilant freedom made her audacious. Her superior subtlety gave her pre-eminence in the home. When her social and legal equality were well-nigh assured, the emissaries of Christianity brought a message from God and imposed it on the people, whereby her humanity was questioned, her possession of a soul doubted, her inferiority divinely affirmed, her perpetual guardianship legalized, her civil rights merged in her husband, and her subordination to him laid down by ecclesiastical laws. In childhood she was denied her share of mental education; in womanhood her civil and political rights. If, in exceptional instances, she led armies or ruled States, or legislated, or otherwise distinguished herself, these were regarded as exceptions to a general rule and her inferiority to man was still determined.

"In England this battle for the equal privileges of women commenced more than 150 years ago, when, in 1739, 'Sophia, a woman of quality,' wrote an able work entitled 'Woman Not Inferior to Man.' She said: 'There is no science or public office in a State which women are not as much qualified for by nature as the ablest of men.' In 1792, Mary Wolstonecraft, in her 'Vindication of the Rights of Women,' demanded that the medical profession, which had been wrested from women, should be thrown open to them again and that they should be allowed to vote for members of Parliament."

Women in English Politics.

Mr. Edward Porritt describes in the *New England Magazine* the position now held by women in English politics. Americans are not generally aware, we believe, of the extent to which women now participate in local government there. "In all local government matters women are now as well placed as men as concerns the franchise, and the only franchise still withheld from them is that on which members of the House of Commons are elected. It is the fact that all electoral franchises in England, local as well as imperial, are based upon the payment of rates or local taxes that accounts for the comparatively small number of women who are on the electoral registers for municipal, poor law, and school board purposes, and it is the same fact that accounts for the small number of women who have sought the suffrages of electors and taken their places on the local governing bodies which Parliament has thrown open to them. To exercise any of the local franchises a man or a woman must be the occupier of premises in re-

spect of which rates for the relief of the poor are paid."

Mr. Porritt explains that women are now eligible to membership of the boards of guardians, the school boards, the district councils, and the parish councils.

WOMEN ON SCHOOL BOARDS.

"Ever since the London School Board has been in existence it has had women on its membership. Miss Helen Taylor, the niece and adopted daughter of Mill, was one of the earliest women members, and among those who have been of the board are Mrs. Fawcett, Miss Devenport Hill, Mrs. Besant and Mrs. Fenwick Miller. Women candidates for the school boards elected in 1870 were not confined to London. At Manchester Miss Lydia Becker was elected to the newly constituted board, and remained a member until her death, three or four years ago. Like the London board, the Manchester board has never been without a woman member. At Bradford, in Yorkshire, women have long been of the board; and in a number of the other large towns women have from time to time come forward as candidates and been elected. The number of women members is gradually increasing, but at no time has it been large, not nearly so large as the number of women who have been elected to the poor law boards. Women of education and administrative capacity are not lacking in the English middle classes, from which membership of all the local governing bodies is largely drawn, but the law as to qualification greatly limits the choice of the electors. Few married women are legally eligible, no matter what their educational and administrative qualities may be, because few of them are rated as occupiers. In this way, except in a few cases, the choice of electors is practically confined to unmarried women and widows. . . .

ADMINISTRATION OF THE POOR LAWS.

"Although work in connection with the poor law affords much greater scope for women than is afforded them in the administration of the Elementary Education acts, it was not until women had been members of school boards for five years that they first turned their attention to the boards of guardians. Miss Martha Merrington was the first woman to take her place on one of these boards. She was elected as a guardian for one of the West London unions in 1875. Soon after her election a central organization was established in London for securing the return of women as poor law guardians. This organization has branches in Manchester and the other large centres, and largely as the result of its efforts there were at the close of 1893 169 women members on the local poor law boards."

WOMEN ORGANIZED IN POLITICS.

It is well known that English women of late have taken a great interest in Parliamentary elections, and about ten years ago political organizations were formed in which women were given a place.

"Strangely enough the initiative in this new movement was taken by the Conservatives. In 1883 they

established the national organization now so widely known as the Primrose League. It was founded to perpetuate the memory of Lord Beaconsfield. In all the local organizations of the League, women are not only admitted to membership, but are intrusted with a large share of the management. Soon after the Primrose League became a power with the rank and file of the Conservative party and a factor in many Conservative electoral successes, Women's Liberal Federations were established. These organizations, which are exclusively confined to women, were just making positions for themselves when the split upon Home Rule occurred in 1886. As concerns the Irish question, women Liberals were as much divided as their husbands and brothers, and following the example of their husbands and brothers many of the women who were active in the new organizations threw themselves into the ranks of the Liberal-Unionists. These women soon realized that, although they were Unionists, they could not throw in their lot with the Primrose Leaguers, and as the need of some organization soon made itself manifest they established a Women's Liberal-Unionist Federation. This is the newest of women's political organizations. It is not as strong numerically as the Women's Liberal Federation, the Gladstonian organization; but in many of the centres where the Liberal-Unionists maintain local organizations distinct from the Conservatives, there are also branches of the Women's Liberal-Unionist Federation.

"The Liberal Women's Federation movement is strongest in the North of England and in London. Except on the Home Rule question there is little difference between the Women's Liberal Federation and the Women's Liberal-Unionist Federation. They are in agreement on the women's suffrage question, the licensing question, and on other social, economic, and political questions which are now engaging attention in England, and both draw their membership from the women of the middle classes. . . .

THE NEXT STRUGGLE.

"Women have now only one more point to gain. When the Parliamentary vote is conferred upon them, as regards the franchise, the contest of the last thirty years will be at an end. Parliament will soon have an opportunity of pronouncing upon this question. Both the Liberals and the Conservatives are committed to some measure for the simplification of the method of registering Parliamentary voters, and when that greatly needed reform is entered upon, the advocates of women's suffrage in the House of Commons will insist that the act accomplishing the reform is so devised as to confer the Parliamentary franchise upon women.

"At one time the friends of women's suffrage might have apprehended difficulties in the House of Lords; but neither political party has now the monopoly of the women's suffrage movement, and Tory, as Lord Salisbury undoubtedly is, and opposed to change and reform as his career in the House of Commons and the House of Lords shows him to be,

even Lord Salisbury must now be counted as on the side of the women's franchise movement. No other meaning can be attached to his speech at Cardiff last November. 'I am sure,' he said, 'that if the Conservatism of the future has any hope of regaining that warmth and that energy which are essential to success, it will be largely due to the sympathy which in these later years it has won from lady fellow-workers.'

"THE FINAL PROBLEM OF WOMAN."

THE first place in the *Fortnightly Review* for May is given to an interesting article by Karl Pearson on "Woman and Labor." He indicates various points of similarity between the two movements—that of the emancipation of women and the emancipation of labor, and declares that the inevitable outcome of the Woman's Rights movement would be the demand by women, not so much for freedom as protection: "The organization of female labor has only just begun. When comprehensive unions of female shop assistants, of female clerks, and, above all, of female domestic servants have been established, then the woman-question will begin to pass into a new phase, and the demand for special legislation and special protection will entirely replace the cry for equality of opportunity which has marked the earlier stages of the present emancipation movement. Then, perhaps for the first time, we shall realize that woman's emancipation is only possible during a socialistic, as distinguished from an individualistic, stage of society—we shall learn, what history abundantly demonstrates to its students, that the position of woman rises and falls with that of labor, and that the need of both is neither equality of opportunity nor freedom of contract, but protection.

NOT CONTENT WITH "EQUALITY OF OPPORTUNITY."

"The home, whether we approve it or no, has ceased forever to be the sole field of woman's activity. Will woman be content with 'equality of opportunity?' We cannot for one moment believe it, when once she has recognized the power organization can confer upon her. Equality of opportunity can only help a picked class, and only the picked women of this class, unless they all forego instincts which, taken from every side at once, are as strong in them as in men. Rather the woman of the future will demand such conditions for her labor as shall practically handicap the competition of the unmarried with the married woman, and of man with woman. The justification for this will not be sought in chivalry toward the 'weaker'; it will not be looked upon as furthering the interests of one class at the expense of another; it will be simply based upon the recognition that woman's child-bearing activity is essentially part of her contribution to social needs; that it ought to be acknowledged as such by the State; that society at large ought to insist, exactly as in the case of labor, that the conditions under which it is undertaken shall be as favorable as possible, and that *pro tanto* it shall be treated as part of woman's work for society at large.

A FAR-DISTANT SOLUTION.

"We may expect national insurance against motherhood to be as much a feature of woman's political programme as national insurance against old age will soon be a feature of the programme of labor. The provision of such insurance will, for the first time, allow of efficient regulation of the labor of married women during the child-bearing years—a regulation which will come none too soon to stop the degeneration of physique which is going on in certain classes of the laboring population. The idea of a national insurance against motherhood may appear absurd enough at first, but it is hard to see in what else the present woman's movement can end. To reconcile maternal activity with the new possibilities of self-development open to women is *par excellence* the woman's problem of the future. It is not one which can be solved by 'equality of opportunity,' but solely by the recognition of maternity as an essentially social activity, by the institution of some form of national insurance for motherhood and by the correlated restriction and regulation of woman's labor. We may be far distant at present from any such solution, but the growing feeling of solidarity among woman-kind, the gradual but steady organization of women to give expression to their needs, and the training which even party organizations are giving to women in political methods, can in our opinion only culminate in precisely the same way as the similar movement has done in the case of labor, namely in the cry for special protection and special provision for the essential conditions of efficient activity. A study of the more advanced woman's journals, both of this country and of America, shows how deeply thinking women are interested in the problems of heredity and of the parental responsibility for producing and rearing healthy human beings. The population question is essentially a woman's question; the social value of one side of her activity is essentially determined by the need for good citizens.

AN INJURY TO THE COMMUNITY AND WOMAN.

"For woman a high birth-rate and a high infant mortality can never be the last word of biological science, its principal recipe for an efficient human society. The unlimited reproduction of bad stock is not only an injury to the community at large, it is a peculiar injury to woman, in that it lessens the value of maternity, and throws her into competition with man without any claim to special protection or to special provision during the years of child-bearing. These are the new features of the woman's problem of the near future—the steps which are converting it from the cry of the unmarried for equality of opportunity to the cry of the married for the reconciliation of maternity with the power of self-determination. Labor and woman meet on the same ground and turn to the same remedies. Will they be successful or not? The answer in both cases largely depends on whether the socialistic state of the future can solve the population question: Can it maintain a fair state of social efficiency without a ruthless destruction of individual life—is a low birth-rate compatible with a high stand-

ard of individual fitness? That is at once the final problem of woman and the final problem of labor."

IS THE REPRESENTATIVE AMERICAN WOMAN WOMANLY?

ALINE GORREN calls her article in *Scribner's* "Womanliness as a Profession," and she seeks to determine if our efforts for "higher education" and the granting of their rights to women has not done something toward undermining this firmest ground on which the feminine glory stands. Aside from the group of good people who rejoice *ad libitum* over the triumphs of "woman's progress," she sees a second party. "In this second group of observers are men who have had university training; men whose occupations are literary, intellectual, artistic; and men of science; physicians notably. These men do not say so much about the new roads that women are traveling; but they think more. And it is beginning to be borne in upon us that their thinking is touched with a doubt, a delicate apprehension. The man whose own intellectual faculties have the ripeness and flexible play that the largest culture gives, is beginning to ask himself whether the intellectualized American womanhood promises to be as *interesting* as womanhood always should be on this earth. If he happen to have studied the young girls who leave our women's colleges, the young women who act as professors in the same, the youthful doctresses in our large cities, he is conscious, on the whole, of a faint, chill misgiving. It is not that these exponents of the new feminine ambition have not many most admirable results to show in justification of that ambition. It is that, with all these admirable qualities, there is a lack of *quality*, precisely; of *the* quality, the womanly quality. Now, when such a man as has been described recognizes this, he is apt to turn cold, and to ask himself whether there be not something amiss in a scheme of education which brings together all the elements of influence, and then leaves out altogether the one magic ingredient which shall set the forces of that influence free." The true field for woman's advance lies, this writer thinks, in the culture of the emotions. The subtlest and most elemental laws of nature have specially fitted her for this, and the true end of her intellectual strivings should be to enter "in the fullest sense into the right comprehension of the great law of specialization."

MARY SPENCER-WARREN, in the *Strand*, publishes an illustrated interview with the Baroness Burdett Coutts. It is very enthusiastic. The Baroness at the age of twenty-three found herself the richest woman in England. To look back on her life is declared to be a historical education. She visited some of the foulest dens in London with Dickens, and as a result of these visits she converted Nova Scotia Gardens into Columbia Square, with its model tenement houses. During the cholera epidemic of 1867 she employed eight trained nurses, two sanitary inspectors, and four disinfectant agents, to

work under a doctor in the East End. She has founded the bishoprics of Adelaide, British Columbia, and Cape Town, at the cost of about \$250,000 apiece. She spent \$500,000 in building the church of St. Stephen's, at Westminster. She started the White-lands Training College, and is the chief promoter of the English Society for the Prevention of Cruelty to Children. She is President of the Destitute Dinner Society of London, which every year gives 300,000 substantial dinners at a charge of from a halfpenny to a penny each.

THE NEW WOMAN.

"OUIDA" asserts, in the *North American Review*, that woman is neglecting immense fields of culture and areas of influence—in short, doing little or nothing with the resources she possesses, "because her whole energy is concentrated on desiring and demanding those she has not. She can write and print anything she chooses; and she scarcely ever takes the pains to acquire correct grammar or elegance of style before wasting ink and paper. She can paint and model any subjects she chooses, but she imprisons herself in men's *ateliers* to endeavor to steal their technique and their methods, and thus loses any originality she might possess. Her influence on children might be so great that through them she would practically rule the future of the world; but she delegates her influence to the vile school boards if she be poor, and if she be rich to governesses and tutors; nor does she in ninety-nine cases out of a hundred ever attempt to educate or control herself into fitness for the personal exercise of such influence. Her precept and example in the treatment of the animal creation might be of infinite use in mitigating the hideous tyranny of humanity over them, but she does little or nothing to this effect; she wears dead birds and the skins of dead creatures; she hunts the hare and shoots the pheasant, she drives and rides with more brutal recklessness than men; she watches with delight the struggles of the dying salmon, of the gralloched deer; she keeps her horses standing in snow and fog for hours with the muscles of their heads and necks tied up in the torture of the bearing rein; when asked to do anything for a stray dog, a lame horse, a poor man's donkey, she is very sorry, but she has so many claims on her already; she never attempts by orders to her household, to her *fournisseurs*, to her dependents, to obtain some degree of mercy in the treatment of sentient creativeness and in the methods of their slaughter.

"The immense area which lies open to her in private life is almost entirely uncultivated, yet she wants to be admitted into public life. Public life is already overcrowded, verbose, incompetent, fussy, and foolish enough without the addition of her in her sealskin coat with the dead humming bird on her hat. Woman in public life would exaggerate the failings of men, and would not have even their few excellences. Their legislation would be, as that of men is too often, the offspring of panic or prejudice; and she would not put on the drag of common-sense as man

frequently does in public assemblies. There would be little to hope from her humanity, nothing from her liberality; for when she is frightened she is more ferocious than he, and when she has power more merciless."

WOMEN AS PUBLIC SPEAKERS.

Advice to Beginners, by Mrs. Philipps.

IN the *Young Woman* for May there is an interview with Mrs. Philipps, who is one of England's brightest and most successful of political speakers. At first, she says, she had a great prejudice against women on the platform, but after a time she found out her mistake. "Now I am more than reconciled, and I fully appreciate the value of public speech. I consider that it is the revival of one of the noblest of all arts, and should take a place in education, and in recreation as well, alongside with writing books and reading them."

MAKE A BUSINESS OF IT.

On being asked by her interviewer, "What would be your advice to the young beginner who suffers from nervousness?" she said: "Take trouble. I often say to women who feel it their duty to speak, but find it so difficult: 'Do you take as much trouble in trying to make a speech as you would in learning French verbs or cooking an omelette? Why should you expect to make a speech without taking the trouble and going through the drudgery which would be absolutely essential to excellence in a very much easier department of work?'"

PRACTICAL HINTS.

Mrs. Philipps says that she was trained in elocution, and she strongly recommends would-be speakers to study voice-production rather than elocution. Here are Mrs. Philipps' hints to a girl who wishes to make an effective speech in public: "First, know all about the question with which she proposes to deal. Whatever arguments she intends to bring forward she should oppose in her own mind, or read the best opponents of them; she should do justice to the arguments of her opponents, and then try to meet them, not with easy rhetoric, but with logical refutation. Next, she should prepare a speech that would take about three hours to deliver, and then cut out everything but the very best parts that would take about twenty minutes. If it is her first speech, and she is troubled with nervousness—which, if she is going to be a great speaker, is exceedingly likely—she should not be ashamed of learning it by heart. She should make notes of her headings only, and then be ready, if the audience inspire her and she has gained self-command, to express any further thoughts that occur at the moment. What helps me most, perhaps, is that whenever I address an audience, however small, I feel that it is a great occasion. I say to myself: Even if I have done nothing of public worth till this moment, and though I may be prevented from doing anything of the kind again, this is a great moment for me, and it is for me to make it a great moment to those who listen.

THREE MODELS.

"There are to my mind three women who in their own way are in their greatest speeches near to perfection in their art—Annie Besant, Lady Carlisle and Lady Henry Somerset. But quite apart from their gifts as public speakers, there are some women whose whole work and character have such an influence on the many women they come in contact with, that they have an extraordinary eloquence of their own; for when they speak the goodness of their lives shines through all they say.

WOMAN'S MISSION.

"I should like to take the opportunity of giving a message to the many women who will read this. Let them remember that we live in heroic days. The overwhelming majority of women might be doing far more than they are now doing, in their own spheres, without changing their line of life, if they would but link themselves together, and put themselves under the inspiring influences which are bringing forth every day so many workers in the fields of philanthropy and reform. Once women come forward to work, remembering this essential truth, which I have often expressed before, that a workless life is a worthless life, they are perfectly certain to join those who want to do away with all disabilities that restrain women, and devote themselves to discovering and using their highest abilities."

THE PIONEER WOMAN IN AMERICAN LITERATURE.

ELIZABETH PORTER GOULD claims for Hannah Adams, born in Medfield, Mass., in 1755, the honor of having been the first American woman to publish a book under her own name, and in support of this claim contributes an interesting article to the *New England Magazine*. Miss Adams published her first book—"A View of Religions"—in 1784, and her last—"Letters on the Gospels"—in 1824.

A LONELY CAREER.

"To realize the loneliness of Miss Adams in her literary career, it is only necessary to remember that when this, the last of her six books, was published (in 1824), not a book of the now well-known American literary women had appeared. In England, Jane Austen had died seven years before; Maria Edgeworth was still living; Harriet Martineau had published her first book, but in the difficulties of transportation it is doubtful whether it had then reached America; Mrs. Browning in poetry, Mrs. Jameson in art, Mrs. Somerville in science, had not appeared. It was to be twenty years before Charlotte Brontë should startle the world. Probably Hannah More, who was ten years older than Hannah Adams, was the only literary woman who had for her any special interest. Some letters from her she highly prized. But in this scarcity of women friends in the literary life, Hannah Adams was not wanting in those of the other sex. President John Adams often invited her to his Quincy home to use his library in compiling

her histories. Her marvelous power of assimilation, as well as application, was a wonder to all the Adams family. One day, surprised at the rapidity with which she went through folios of the ancient fathers, Mr. Adams spoke to her about it, only to learn that while leaf after leaf had been turned, she had culled all she needed for her work."

WORKING-GIRLS' CLUBS.

THE organizations known as clubs or societies for working-girls in New York and other American cities are described by Clara Sidney Davidge in *Scribner's*. The first of these clubs was formed ten years ago, of thirteen members, and chose for itself a non-sectarian, self-governing, independent platform which has been the model for all later societies.

THE FINANCIAL BASIS.

"The desire to be self-supporting and independent of outside aid renders the careful administration of club finances of first importance. The monthly dues paid by the members are fixed at 20 or 25 cents, with an initiation fee usually of the latter amount. A paying membership of 200 girls will enable almost any club to carry its expenses, which, even in a large city, for rent of rooms, light, heat and care, should average not more than \$40 to \$50 per month. For initial expenses of outfit or special necessities, funds are raised by entertainments provided by the members, at which a small admission fee is asked, and from fairs and sales of articles made or contributed by members. . . .

WHAT THE CLUBS ARE FOR.

"An immense amount of thought and labor has been spent in the formation and conduct of these societies, and with what object? That girls may make for themselves, by co-operation, opportunities for social intercourse, self-improvement and advancement. Primarily intended as a common meeting-ground where differences in circumstance or degree are sunk for the time, the club is, first of all, a place where a girl may expect to enjoy herself after work hours. There cannot be too much opportunity for recreation in such a club, yet girls seeking amusement, or excitement only, rarely join clubs, or if they join are sure to drop off. Class work is soon demanded by the members themselves, and the courses mapped out are suggested and discussed by the girls at business meetings, and at the 'Practical Talks' which occur in most clubs at regular intervals.

WORK AS WELL AS PLAY.

"If skilled and paid teachers are employed for classes, an extra fee is often charged, and only those able to pay the fee join such classes. In this way, or by the free instruction of volunteer teachers, millinery, dressmaking, cooking, first aid to the injured, and other branches are taught. By means of these classes the attendance at the club rooms is distributed through the week, the crowded nights, when a majority of members is present, being limited to strictly social occasions, business meetings, and the 'Practical Talk' nights.

"At the 'Practical Talks,' subjects for discussion

are often proposed and voted on by those present, such subjects, for example, as the following :

" 'What is wealth?'

" 'Should women be allowed to vote?'

" 'Why do so few girls marry nowadays, comparatively speaking?'

" 'Life and its struggles.'

" 'How to tell a real lady.'

" 'When women take men's places and cut down wages, what is the effect upon the home?'

"Very often a course of subjects is chosen, such as 'Famous Women,' 'Talks on Hygiene,' 'Elementary Facts of Science,' and the like. The success of a series of such 'Talks' naturally depends largely upon the leader, and on her ability to impart information clearly and in an interesting manner. It is also important to draw as many girls as possible into the discussion that follows the 'Talk,' to evoke the opinion of 'modest members,' and to hold the attention of all.

"The monthly business meetings afford training in system and order, and lead to familiarity with parliamentary rules. At these meetings the officers report as to financial condition and general affairs; heads of committees give an account of departments under their control; opinions are requested as to proposed new movements, discussion follows, and the club learns to know itself individually and as a whole. . . .

BENEFIT FUNDS.

"The Mutual Benefit Fund is of the greatest importance to club members. Except through the Penny Provident Savings system, which has been introduced to some degree in the clubs, provision for emergencies is rarely made. Benefit societies, so called, although often dishonestly managed and demanding extortionate rates, are well known in factories. Their promoters prey upon employees in all branches of business, and the victims pay away a large share of their earnings that a meager death benefit may eventually be secured by their family. In this Mutual Benefit Fund there are two classes of members. First, those paying 50 cents initiation fee and 25 cents monthly dues. Second, those paying 50 cents initiation fee and 15 cents monthly dues.

"The benefits are: For members of the first class, \$5 a week for six weeks (\$30) during illness, not more than once a year, and \$30 at death.

"For members of the second class, \$3 a week for six weeks (\$18) during illness, not more than once a year, and \$20 at death.

"For members joining both classes, \$8 a week for six weeks (\$48) during illness, not more than once a year, and \$50 at death.

"There are now 250 members enrolled in the fund.

AIDS TO SECURING EMPLOYMENT.

"The Alliance Employment Bureau was opened in connection with the clubs to supply a systematic method for securing work for those without it. Certain lines of work are more popular than others, certain trades require less skill and training in those who follow them; and these avenues are crowded in proportion as population is centred.

THE NEED OF A NATIONAL HEALTH SERVICE.

ATTENTION is again called to the need of a National Health Service through a petition of the American Medical Association to Congress published in the *Sanitarian*, and by an article on the subject in the *North American Review*. At each of its last three annual meetings the American Medical Association adopted resolutions favoring the establishment of a Department and Secretary of Public Health, and this proposition was also discussed and approved by the Pan-American Medical Congress which met in Washington, September, 1893. Moreover, a large number of State boards of health, the National Board of Public Health and various medical societies in different States and cities have given their indorsements to this movement. No action, however, has so far been taken by Congress in response to these appeals further than to refer to committees bills to establish such a department, which were introduced in both houses in December, 1891.

PETITION OF AMERICAN MEDICAL ASSOCIATION.

The American Medical Association consists of men of distinction in every part of the United States. For more than forty years it has held annual sessions in the chief cities of the United States. These sessions have greatly promoted scientific research in the causes and treatment of diseases of every character, encouraged higher medical education and the formation of State boards of health. The petition of this association for a National Health Service, therefore, demands more than passing consideration. We give as follows extracts from this petition to Congress:

"The government, through the operations of the Surgeons-General of the Army, Navy and Marine Hospital Service, has made liberal expenditures for the National Medical Library and its Index Catalogue, a pathological museum, and some investigations on the origin, nature and spread of the fearful infectious germs that are brought to us by immigrant and other ships. But the medical profession believes that the government can, in a wider way, promote the public welfare by creating a Department of Public Health, the head of which should be a physician, a member of the Cabinet and on a parity with the heads of the Departments of War, Navy, Finance, Justice, Agriculture, etc. A fair investigation will show that no profession excels ours in positive efficiency to sustain public order, public comfort and public virtue.

"As we have no national office for the collection of such statistics, except, perhaps, the Bureau of Labor in a partial way, we must rely upon those furnished by other nations.

EVILS TO BE INVESTIGATED.

"The telegraph operators, everywhere, sooner or later become the victims of scrivener's palsy of the forearm and fingers on account of the excessive use they are obliged to make of them, for as their celerity fails their wages decline. The mail clerks on railroad trains are required to work many hours more

than in other government offices, and are, besides, compelled to memorize, with all the certainty of the multiplication table, the locality of 8,000 to 10,000 post-offices in the vast districts of the country. The effect in numerous cases of this excessive use of the memory is insomnia and a mild form of dementia. It is, certainly, a function of statesmanship to investigate these serious evils. The government has begun to investigate the exposure of employees on railroads who are often wounded and killed in the coupling of cars; and the investigation of the desperate use of young people in the 'sweat shops' of clothing establishments has created a great outcry for their relief."

"Our census of 1890 shows that 524,000 deaths occurred in that year, and that 100,000 were from consumption. It is estimated that about one-half the whole number was due to diseases that could have been prevented.

PROTECT THE PUBLIC HEALTH.

"We are not asking Congress to build a great medical school of instruction. Congress appropriates willingly large sums for the study of the diseases of cattle and plants, but comparatively nothing for the diseases of the people. But we show you that 522,000 inhabitants died in 1890, and that 250,000 of them at least have perished by diseases which are preventable.

"We ask for a governmental Department of Public Health; one of whose functions would be the combination of the intelligence, feeling and force of all the schools and medical societies of the nation for collective investigation, in order that physicians may become capable to the utmost to relieve the woe and agony of suffering in individuals and families.

"For the medical profession to be able to exert all its benign influences in society, it must have the same rank and dignity that is attached to other departments in the President's Cabinet. The methods of research are the same as those employed by other scientists. The methods of the calculus that are employed to ascertain the cause of the perturbations of celestial bodies are the same as those employed in the investigation of obscure diseases. The physician is guided in his investigations by the canons of logic, and hence it is that the opinions of well-trained doctors are as reliable and stable as those of jurists, statesmen, engineers, merchants, divines, lawyers and political economists. The same reproach applied to doctors, because of their different opinions, applies equally well to all other callings.

"At this time the success in medical practice surpasses any other period of its history. The death-rate in our general hospitals was never as low. In surgery it is about 3 per cent.; thousands of successive births take place in maternity hospitals without a single death; the mortality in typhoid fever is about 3 per cent. in hospital practice; in general medicine the rate is declining; but it is not as low as in surgery, because of the increasing mortality, as before said, in such diseases as consumption, cancer, kidney, heart

affections, and the continued bad hygienic conditions in the congested areas of our large cities, where one-half the children die under five years of age.

HOW TO HELP THE FARMERS.

"Though Congress is voting vast sums for agricultural schools and experimental stations, yet these are above the reach of the great mass of farmers and their adult sons and daughters. They cannot leave the fields and the household duties for at least nine months of the year, and they cannot pay the expenses incident to college life; but schools of instruction, by means of lectures, demonstrations, drawings and experiments in physics, chemistry and the structures and the functions of the chief organs of animals and plants, can be readily inculcated by the doctors in medicine who have themselves been taught in this manner. These lectures can be given by physicians during the winter seasons in the towns of the counties and within reach of the farmers' homes, and a central office, such as we propose, would aim to promote this without expense to the government.

"It will be the means of putting new life into the freshest and strongest minds of the people. Every farm would soon become an experimental station; nature would be seen with new eyes, and the dull and monotonous lives of this most neglected class would become radiant with a new light. This may be counted one of the great influences that will follow the higher education of physicians.

"The question may arise whether such a department in the government would subserve the interests of any particular sect or school in medicine. We reply that, amid the apparent disparity in medical practice, there is one true unity, and to attain this all true physicians are continually striving. It is evident that there can be but one anatomy, physiology, pathology, chemistry, physics or preventive medicine. The difference among doctors lies in therapeutics or treatment of disease, and as in the past, so for the future, practitioners will use a variety of remedies and in varying quantities, and there will be different modes of management of sick and injured people. With the advance in medical education the modes of treatment will become more unified.

NEED OF A NATIONAL DEPARTMENT.

"The organism which is called medicine, like every other product of man's constructive genius, is striving to attain perfection, and to accomplish this it must be sustained in all its scientific undertakings by the co-operation of national and State legislation.

"We ask each member of Congress, who seeks relief for himself and his family in the times of their distress through the most accomplished practitioners of medicine, to consider that his mind is the type of that of millions who constitute the Republic; and therefore we ask him to lend his influence to our effort to secure for the people the most highly trained persons in the science and art of medicine.

"We hope that it is plain that a Secretary of Public Health would represent the medical consciousness

of the nation, and that he would be one to whom we could all look for the exploitation of measures that will direct continuous scientific collective research in regard to epidemic and endemic diseases, and especially those of a degenerative character; and thus make his department the repository of the most important measures that concern the welfare and comfort of the people; and his duties will steadily grow broader and stronger in adaptability to public needs."

Another Proposition.

Surgeon-General George M. Sternberg, writing in the *North American Review*, while favoring the establishment of a Department of Public Health, with a Cabinet minister at its head, is inclined to doubt that such a measure could be carried through Congress. He therefore urges the adoption of the bill prepared by the committee of the New York College of Medicine, which proposes to establish a bureau of health within the Department of the Interior of the United States. This bill provides for a Commissioner of Public Health and an Advisory Council, the Commissioner to be an expert sanitarian, appointed by the President, by and with the consent of the Senate, whose duty it shall be to preside at the meetings of the Advisory Council, and who shall be the responsible head and executive officer of the bureau.

Surgeon-General Sternberg is strongly in favor of this proposition to put a single commissioner at the head of the bureau of public health, pointing out that the defunct National Board of Health consisted of several members living in various parts of the country, and who, with the exception of the secretary, devoted their time to other pursuits except when they assembled in Washington for a regular or special meeting of the board. Moreover, this board not being attached to either of the great departments of the government, had no defender in the Cabinet and was subject to attacks of enemies whose ambition it was to supplant it. The bureau of public health, he declares, should be within the Department of the Interior of the United States rather than within one of the other departments, since the demand for the sensible health bureau comes largely from the great interior.

DEMAND OF THE INTERIOR.

"It is here that the greatest saving of life can be effected by sanitary improvements, and it is here that the greatest losses would occur if cholera should be introduced into the country through one of our sea-ports. That these great interior States shall have no voice with reference to the regulations to be enforced at seaboard cities for the exclusion of exotic pestilential diseases, which when introduced have no respect for State lines, is no more reasonable than to refuse them a voice with reference to the maintenance of a navy and seaboard defenses. They pay their share of the taxes which go to the support of the institutions for the common defense, and they are willing to pay their share of the expense of maintaining a national quarantine service.

NATIONAL QUARANTINE SERVICE.

"This bill of the New York College of Medicine provides: 'That whenever the proper authorities of a State shall surrender to the United States the use of the buildings and disinfecting apparatus of a State quarantine station, the Commissioner of Public Health shall cause an examination thereof to be made by a competent person or persons, and if the said station, buildings and disinfecting apparatus be found adapted to the purposes of a quarantine, and the Commissioner of Public Health approve of their use as such, the Secretary of the Treasury shall be authorized to receive them and to pay a reasonable compensation to the State for their use.'

"Under this provision our quarantine service, in time, may become what it should be—national and uniform. At present the interior States feel that they are at the mercy of those local authorities who control the appointment of quarantine officials and the enactment of State or municipal laws governing the quarantine establishments. The laws may be satisfactory and their administration may be placed in competent hands, but there is no guarantee that this will continue to be the case. And if the laws are defective or the administration lax at a single seaport of our extended coast-line, the dreaded invasion may occur and the germs of pestilence be widely sown in spite of the intelligent efforts made for their exclusion at other ports.

"Although the desirability of a uniform and national system of quarantine administration is apparent, this cannot be effected at once, and the only way of eventually accomplishing it appears to be that proposed in the bill under consideration. But just here lies the danger that the bill may be defeated through the influence of interested parties. Those at present in charge of quarantine establishments see in this clause a threat that they may be displaced by officials of the general government. This, however, does not follow even if 'the proper authorities of a State shall surrender to the United States the use of the buildings and disinfecting apparatus of a State quarantine station.' The man who has shown his efficiency in the administration of the State establishment would be wanted by the Commissioner of Public Health for similar service in connection with the national quarantine station.

A COUNCIL OF SANITARIANS.

"Another important feature in the bill is the provision for an Advisory Council to consist of one member from each State of the United States. 'Such member shall be a physician of good repute and standing and shall be appointed by the Governor of the State which he is to represent in the Council.' This provision is a wise one from two points of view: The Commissioner will have the advice of a select body of sanitarians, from all parts of the country, each one of whom will be able to give him valuable information with reference to sanitary matters in his own State and to put him in touch with the local health authorities for the purpose of obtaining sanitary

data, etc. And, on the other hand, the members of the Advisory Council will obtain valuable information from the discussions held at the annual meetings and from a personal knowledge of investigations undertaken by the Commissioner, and will disseminate this useful information upon their return to their homes among the people of their respective States."

The principal objects of a central health bureau should be, says Surgeon-General Sternberg, to extend and disseminate exact knowledge regarding sanitation, to give advice with regard to its application to special cases, to correspond with the central authorities of other countries for the purpose of learning their methods of sanitary administration and the results of the same, and to collect and publish vital statistics. He lays stress upon the importance of the last mentioned of its functions. It is only, he says, with reference to vital statistics that we can obtain precise information as to the principal areas of prevalence of various preventible diseases, the reasons for increased or diminished prevalence in a given area and the results obtained by sanitary improvements.

THE HISTORY OF VACCINATION.

DR. A. H. DOTY, of New York City, contributes in the *Medical Record* a brief account of the origin and spread of the practice of vaccination against small-pox.

"Edward Jenner, the discoverer of vaccination, was born in 1749, in Berkeley, Gloucestershire, England. Early in life he showed a predilection for natural history, the preparation of zoological specimens, etc., and apparently had resolved to follow this occupation. It was decided, however, that he should enter the medical profession, and he was apprenticed to Mr. Ludlow, a surgeon of Sodbury, near Bristol. It was during this period that the power of vaccination was unfolded to him. He had learned of the tradition existing among the people employed in dairies, that those whose hands became infected as the result of milking cows having an eruption about the teats and udder, known as 'cow-pox,' were protected against small-pox. It seems strange that this report had not received greater attention, but the indifference of the people generally to traditions, and the reticence on the part of owners of dairies to furnish any information which might injure their business, may partly account for it.

JENNER'S DISCOVERY.

"It did not escape the observation of Jenner, who, for almost thirty years, carefully and patiently investigated the subject, and having demonstrated the protection afforded by vaccination to his entire satisfaction, gave to the world in 1798 his description and results of vaccination in a paper entitled 'An Inquiry into the Cause and Effect of Variola Vaccina.' During the period of his investigation he did not try to conceal his discovery, but freely discussed it and invited help, but met with nothing but indifference and discouragement. Even John Hunter, under whose care Jenner, as a favorite student, studied while in

London, and with whom he lived for two years, was not impressed with the importance of vaccination; he occasionally spoke of it to his friends and referred to it in his lectures, but nothing more. Undaunted, Jenner continued his work, and at last, on May 14, 1796, vaccinated James Phipps, eight years of age. The operation was successful, and in July of the same year the boy was inoculated with lymph taken from a small-pox vesicle, and, as Jenner predicted, no result followed. The disappearance of cow-pox retarded the investigation until 1798, when vaccination was repeated. In the mean time he had gone to London to continue his work, but it was three months before a vaccination was performed in that city. This was done by Mr. Cline, a surgeon connected with one of the hospitals, who vaccinated a boy suffering from hip disease, not so much as an evidence of his belief in its protective influence as in the hope that it might prove to be a good counter-irritant. Other vaccinations followed, and the success of the new discovery became assured. Vaccination spread rapidly throughout England and the Continent; not, however, without considerable opposition and many annoyances to Jenner, principally on account of the ignorance displayed on the part of those who vaccinated, and the worthless quality of the virus used.

IN THE UNITED STATES.

"Vaccination was introduced into the United States in 1800, by Dr. Benjamin Waterhouse, of Boston, and in New York by Dr. Valentine Seaman, who, on May 22, 1801, vaccinated several persons with lymph obtained from the vesicle on the arm of a servant of Governor Sergeant, who was vaccinated in Boston by Dr. Waterhouse, and arrived here before the eighth day. In January, 1802, an institution for the purpose of free vaccination was established in New York, with Dr. Samuel Scofield as resident surgeon. This was subsequently merged into the New York City Dispensary."

Small-Pox in the United States.

The late Dr. John H. Rauch, just before his death, sent to the *Journal of the American Medical Association* a detailed statement of the small-pox situation in this country on March 17, 1894. The important facts are summarized in the concluding paragraphs: "There are now in Massachusetts 21 cases; of these 17 are in Boston. Connecticut, 2; New York, 123, distributed as follows: New York City, 43; Brooklyn, 60; and 20 cases throughout the State. New Jersey, 4 cases; Pennsylvania, 29; 12 of these being in Philadelphia. Ohio, 7 cases; Indiana, 3; Illinois, 168 cases; of these there were 15 in the State and 153 in Chicago. Wisconsin, 10 cases; Michigan, 4; Iowa, 1; Virginia, 1; Georgia, 10; Vermont, 1; and Tennessee, 8 cases. Total in the United States, 389 cases, and less than there were on March 1.

"From the foregoing, it will be seen that the effort of the health authorities, taken as a whole, has been successful, if not in stamping out the disease, in controlling it, as the only places where there is an increase are Chicago and Brooklyn."

HOW THE BIBLE GREW.

Higher Criticism and the Old Testament.

IN the *Quarterly Review* there is an article on "Old Testament Criticism" which is interesting, if only because it summarizes within a very brief compass the conclusions at which the Higher Criticism has arrived in its study of the evolution of the Old Testament. The *Quarterly* reviewer gives the following outline as being, in his opinion, the substantial concrete statement of the chief tendencies of many of the best qualified biblical critics: "The following outline is necessarily imperfect, but it is, we believe, substantially correct:

"1. It is regarded as scarcely doubtful that (a) there are four documents in our present Pentateuch: the First Elohists or Priestly Codex, the Second Elohists, the Jehovists, the Deuteronomist; (b) each of these documents existed as an independent writing before incorporation into the Pentateuch; (c) in their main features these documents can be distinctly traced, and, while there is much diversity in details, there is practical unanimity as to the main outlines of their contents; (d) there are in Pentateuchal legislation at least three distinct codes of laws—the covenant (judicial) code, Ex. xx.-xxiv., xxxiv.; the prophetic, parenthetic popular code of Deuteronomy; the esoteric priestly code, of which the center is Leviticus. These codes show characteristics of their history, their date, their purpose, and exhibit clear stages of development from the simple to the complex.

"2. It is further held, but with less general agreement, that (a) the literature and history alike make it impossible to regard the Pentateuchal legislation as one whole, and they can only be understood on the assumption that the Deuteronomic and Priests' Codes did not exist or were not known, the one before the reign of Josiah, the other before the Exile. The literature is silent about them, and the history presents frequent violations of them, or unconsciousness of them, by persons who were the representatives of God to the people; (b) the Books of Judges and Samuel are written by one who knows the Book of the Covenant, but not the Deuteronomic or Priestly Code. The Books of Kings are written by one who knows and is imbued with the spirit of the Deuteronomic Code, but is ignorant of the Priestly; the Books of Chronicles by one who interprets the history by the Priestly Code; (c) the prophet Ezekiel—the great priest of the Exile—occupies common ground between the Deuteronomic and Priestly Codes, and furnishes the basis for the later legislation; (d) as with the legislation and the institutions, so with the theological ideas. There is throughout the literature and the history a clearly traceable development corresponding with and confirming the general evolution.

"3. The dates of the four great documents are, for those who accept the foregoing propositions, roughly as follows: 1. The Jehovist, at the end of the ninth or beginning of the eighth century B.C. 2. The Elohists, that is, the second Elohists of Hupfeld, which has now in the school of Graf become the first, prob-

ably some fifty years later. These documents are conveniently known by the symbols J and E respectively; and were later—after perhaps a hundred years—amalgamated with editorial modifications into one document known as J E—i.e., the great prophetic *History Book*. 3. The Deuteronomist followed soon after the amalgamation of J and E, not later than B.C. 621. The obvious symbol for it is D. 4. The Priestly Codex—i.e., the first Elohist—now become last, in the first quarter of the fifth century B.C. It is referred to as P or P C, and by Wellhausen as Q (*quatuor*), from the not very happy idea that it contains four covenants."

ROBERTSON SMITH.

PROFESSOR LINDSAY pays an eloquent tribute to his friend Professor Robertson Smith in the *Review of the Churches*. The following extracts give

THE LATE PROFESSOR ROBERTSON SMITH.

Professor Lindsay's view on the question which made Robertson Smith's name a household word in Scotland. Robertson Smith was the most popular exponent of the Higher Criticism in Scotland, and, characteristically enough, he maintained he was brought to that way of thinking by no less orthodox an authority than John Calvin. "Calvin," Prof. Smith declared, "had set before him as the goal of biblical study to gather into one whole of all God's dealings with man from the fall to the Resurrection, the history of true religion, the adoption and education from age to age of the Church in a continuous scheme of

gradual advance. And the only method of carrying out Calvin's idea is the honest practice of the Higher Criticism, which means to look at the Bible fairly and honestly as a historical record, and the effort everywhere to reach the real meaning and the historical setting of the Scripture records, *as a whole*, by letting the Bible speak for itself altogether apart from human traditions of any kind whatever. These were the principles which he gave us in the Theological Society where he found and formed his powers, and they remained with him his life long."

A SCHOLAR'S MODESTY.

A modest and unassuming man, he had no conception of the storm which his views would arouse when he wrote them out clearly and succinctly, so that all men could read and understand them. "When he wrote his famous article 'Bible' for the *Encyclo-*

pædia Britannica he never dreamt that any one would take offense. He was writing as a scholar for scholars, but he had in articles, addresses, sermons, lectures, shown, as he thought, that his critical principles were based on Reformation theology, and no one had objected. But he had never foreseen that the wholesale overturn of traditional views would shock the mass of people, who would have contentedly accepted them had he only given them a few at a time.

THE VALUE OF DISCUSSION.

"I need not record the history of the famous case, which gave a great shock

to the Free Church, and yet in the end educated not only its ministers but its common people. I have little doubt that, however unfortunate for the man, it was a great thing for the people that the battle was fought out in a democratic Church, where nothing intervened between professor and membership but representative Church courts. The Robertson Smith case set men and women reading about the Bible and reading the Bible as nothing else has done during the century. In outlying country parishes small farmers, plowmen, and shepherds, in the cities small shopkeepers, clerks and artisans,

clubbed together to buy 'The Old Testament in the Jewish Church,' and formed little societies to read it and discuss it. His friends never doubted victory for the cause, though they feared they would lose the man. If the case could have been kept going a year or two longer both cause and man would have been saved."

A MARTYR TO TRUTH.

Unfortunately it was not kept going for a year or two longer, and after the question had been before four assemblies, the blow fell: "At last, in 1881, the Assembly, under the leadership of Dr. Rainy, sad to have to say it, removed him from his chair. They were careful not to pronounce his views inconsistent with the doctrine of the Church, they left him free to take a pastoral charge, but they made him cease teaching. He was advised that the course was utterly illegal, thoroughly unconstitutional, that he ought to appeal to the Civil Courts, that he and his friends should leave the Church. But sad as he was at heart and sore in spirit, he was too good a Free Churchman to appeal to Cæsar in a spiritual case, and too loyal to the Church of his fathers to seek to weaken it. He used every persuasion to prevent any secession; only for himself he would take no ministerial place in the Church until the unjust sentence had been reversed. The burden and excitement of these four years told heavily on him. He lived nearly fourteen years after his removal from his chair, but he was never quite the same man physically afterward; nor is it to be wondered at by any who knew what he went through. There are many ways of martyrdom—what was done to Robertson Smith was one of them. He was a true martyr—a witness who gave himself for others. He did, if any man did. Scotland has an insight into the meaning of the Bible, and Scotch ministers and office-bearers have entered into the fruit of his labors. It was hard on the man, but such is the faithfulness to death which the truth always demands from her pioneers and discoverers."

A JEWISH VIEW OF ST. PAUL.

Mr. Montefiore's First Impression of the Apostle.

IN the *Jewish Review*, Mr. Montefiore publishes a very suggestive analysis of the doctrines of the Apostle Paul as they appear in the eyes of a modern Jew. He says: "The Epistles of Paul fill a new-comer with immense astonishment. They are so unique. They are so wholly unlike anything else he has ever read. Humanity is composed of Jews and Gentiles. It is in their relation to God that Paul's great pre-eminence, his big religious advance, his most permanent contribution to religion, consist. His conception of the Law, his theory of Christ, his views about Israel, his doctrine of justification, seem all not only original, but utterly strange and unexpected. His break with the past is violent. Jesus seems to expand and spiritualize Judaism. Paul in some senses turns it upside down. In his eyes the main purpose of the revelation to Moses and of the giving of the Law was to make things worse, to in-

crease the quantity, and to accentuate the sharpness of sin. 'The Law came in beside that the trespass might abound.'

HIS VIEW OF THE CASE.

"In no other point does the originality of Paul show itself more decisively. Such an absolute *bouleversement* of the Jewish conception of the Law is not to be explained by any influence of Hellenism. It is purely due to the daring genius of its author. For Paul the significance of Christ's work lies almost exclusively in his crucifixion and resurrection. His work is essentially miraculous and supernatural. Paul was a disciple of Jesus, in so far as the Messiahship and Crucifixion and Resurrection were concerned; but to the teaching of Jesus, as such, he rarely alludes.

"Many thoughts, and even difficulties, are raised by Paul's theory. First of all, we notice that it is historically inaccurate. It is doubtful whether any one before Paul ever felt that the Law was 'the strength of sin,' or was driven through the Law to spiritual despair.

MR. MONTEFIORE'S CRITICISM.

"Paul's theory, if I understand it rightly, seems to me as religiously cruel as it is historically false. What God is that who has given unto man a law which man must necessarily disobey, who has offered a condition for salvation which must necessarily be unfulfilled?

"We have now passed through the main points in Paul's attack upon the Law. We have seen that while given apparently for eternity, its real purpose was only temporary. Its seeming object was to make men better, and to qualify them for the Kingdom of God; its true object was to create the knowledge and the lust of sin. At its best, its intended result was to stimulate a desire for redemption through the medium of a spiritual despair; at its worst it led almost inevitably to self-delusion, hypocrisy and pride. It claims fulfillment, but no man can fulfill it; it demands obedience, but none can obey. It threatens the transgressor with a curse, but it was only given that transgression might abound; it promises the doer of it reward, but the reward is beyond man's power to attain. Truly an awful gift from God; a marvelous issue of evil from that which in itself was 'holy and righteous and good.' Surely the disproportion of effect to cause is itself enough to prove the error of the argument.

PAUL'S ZEAL FOR RIGHTEOUSNESS.

"Paul's zeal for righteousness and holy living is essentially Jewish. His tremendous enthusiasm for his cause, which is at once religious and ethical, gives this zeal a glow and fervency peculiarly his own. His hatred of sin is very inspiring. Equally striking, I think, is his grasp upon the essentials of morality. There is a unity in his ethics: the virtues hang together. On one or two principles, whether religious or ethical, all seem to depend. Nor can we forget that the great Apostle of faith has yet placed faith below love. This seems the culminating proof of the fact that no trace of ethical antinomianism can be elicited from the Epistles of Paul."

JAPANESE "NEW THEOLOGY."

THE Rev. J. L. Atkinson, writing from Kobe, Japan, furnishes *Our Day* with an interesting account of recent theological movements among the Japanese converts to Christianity.

"The Japanese have at length thought out a theology. They have chosen a name by which to designate it. The term in the vernacular is *Shin-shingaku*. This in English becomes New Theology. The process of thinking out this system has occupied a number of years. The 'leaders' have discussed the subject among themselves by conversations. They have preached sermons, printed articles in the religious papers and magazines and have gradually reached the point where their views may now be said to have become crystallized and fairly settled. They have read Orthodox, Broad Church and Unitarian theological literature. They have consulted with a variety of religious teachers, including Mrs. Humphry Ward, the authoress of 'Robert Elsmere.' They have without the least doubt done a great deal of hard thinking."

THE MEANING OF REDEMPTION.

To show some of the results of this thinking, Mr. Atkinson quotes from a paper prepared for the World's Parliament of Religions by Mr. Yokoi:

"The theologians commonly say that the death of Christ brought a new element into the religion of Jesus which could not have been revealed before, viz., the expiatory merit of that death; that all the teachings of Christ had been in a sense preparatory to the great expiatory act of His life; that we must go to the teachings of the disciples if we would learn about the nature of Christian faith; and that it was by the blood and sufferings of Christ on the cross that our redemption was bought. We, however, are compelled to contest this position. If we understand the cross and its significance rightly, we are unable to see in it any new teaching, but rather the most powerful expression of the old teaching of Jesus—viz., that to die to self and to live for others and for God is to enter into eternal life; and Jesus by shedding His blood and dying on the cross gave to this great truth the most powerful expression. The important thing was not that He should suffer and die merely, for a great many besides have similarly suffered and died, but that He should suffer and die in faith and joy, blessing His crucifiers and hoping in God, and thus teaching all ages to come that self-sacrifice and not selfishness was the true and normal way of life. This is what makes the cross of Christ such an important factor in Christian faith."

CHARACTER OF THE LEADERS.

The writer in *Our Day* is evidently a man of conservative views, but his tribute to the personal worth of the liberal leaders in new Japan is hearty and unreserved: "What the practical effect on the life and work of these 'leaders' the adoption of this new theology may be, it is impossible to say. It is, however, only just to them to say that without a single

exception, so far as the writer knows, they have in the past done some noble, self-denying and successful Christian work. No words of appreciation and of praise can be too ardent in setting forth the labors and successes of these 'leaders' in the early years of their Christian ministry."

GOUNOD AND CHURCH MUSIC.

THE Rev. H. T. Henry, in the *American Catholic Quarterly Review*, presents an elaborate critique of the contributions of Gounod to the music of the Church, concluding with a finely sympathetic estimate of the composer's style.

THE SENSUOUS IN MUSIC.

"What, then, is the 'sensuous beauty' of music? There is a purely mechanical counterpoint which, because it violates no rule, appeals to the intellect and baffles the censure of the teacher. It is like the Latin 'poetry' manufactured in our seminaries—Horatian or Virgilian in everything but beauty. Such music has really only one defect—it is not music."

"Then there is the music which, while it flatters the sense—as it is of the essence of music to do—gratifies also the intellect by its skillful development of subject, its clarity of form and expression, its well-defined content, its sudden delicate surprises of chord or of melodic progression, and the many other graces which are more or less amenable to scholastic rule. There is here, therefore, the genius of artistic manipulation as well as the genius of inspiration. Its 'sensuous beauty' can never be wanting; but while the 'profane crowd' are contented therewith, the gods dwelling on high Olympus receive the added pleasure of intellectual satisfaction—even as the knife of the botanist can reveal to him a deeper beauty in the flower."

BEAUTIFUL AS WELL AS SACRED.

"In this view all music must be at least *sensuous*. But the word has ordinarily a repugnant meaning. There is a suggestiveness in some melodic and harmonic progressions which (whether essentially or habitually it concerns us not to inquire) may be considered 'voluptuous' in its bad sense. The sensuous beauty of Gounod's music is certainly not of this kind. His church music—whether it be styled sensuous or intellectual or what not—is sacred and inspiring. Sacred does not necessarily mean *sad*, *gloomy*, 'strictly diatonic,' oppressively contrapuntal; but neither may it be voluptuous and worldly. What has been said of the *Sanctus* of the St. Cecilia Mass might with even greater force be said of all the other numbers of that Mass: 'With a fullness of symmetrical beauty justifying the old poet's epithet of "ravishing" are combined a *devotional fervor and dignity which render the strain wholly inapplicable to any secular purpose.*' It labors under no affectation of newness or oldness, and will claim to be sacred music in virtue only of its own inherent beauty and dignity. 'The music is

not new, if "new" is to mean either flimsy or ugly ; the music is not old, if to be "old" is to be harsh and formal, to exhibit the hard scaffolding of science, behind which no beautiful structure exists.'

"Gounod's music is both sensuous (in its proper meaning, as all beauty must be which appeals to the sense as its immediate judge) and intellectual. But, as we have said, Gounod belonged to no school. His style felt vastly the beautiful and heavenly—if we may be permitted the epithet—influences of the Gregorian Chant. It knelt at the shrine of Palestrina ; it listened to the dignified counsels of Gluck's *apologia* ; it loved Mozart and revered Beethoven ; it followed somewhat the imaginative trend of Schumann's Romanticism, and disdained not to follow, if not to imitate servilely, the dramatic doctrine of Wagner. His music is fresh without *bizarries* ; it is dramatically emphatic without irreverence."

ANECDOTES OF VON BÜLOW.

FRANCES E. REGAL contributes to *Music* many curious and interesting anecdotes of the late Dr. Hans Von Bülow, from which we select the following :

"Bülow did not give private lessons, but was accustomed to have a class for a month in May at Berlin, and in June at Frankfort, to which students were admitted for 200 marks and listeners for 100. At these large gatherings those who had anything ready to play sent in their name, or he chose what he wanted, while the rest waited in terror for their turn to come, and their terror was not without cause. An awkward English girl once went to the piano, and, half frightened to death, managed to play her piece after a fashion. 'Ach Gott!' roared the irate doctor, 'you play the easy passages with a difficulty that is simply enormous!' And he swept the poor girl from the keyboard. Bülow absolutely forbade the use of the pencil in the class room, and it was with difficulty and peril that any of the bright things that fell from him were preserved.

"As might be expected with his hard head and restrained fire, he despised unbridled emotions and affected sweetness. 'Liszt, Chopin and Wagner,' he said, 'are often hysterical ; Bach, Beethoven and Brahms never ; therefore the latter are the higher.' 'Tristan and Isolde' he called a nervous fever, but Handel, he said, had no nerves, and for his colossal genius he had a great admiration. 'Handel cannot be played with dainty fingers ; he must be pounded out,' said Bülow, and he would doubtless have recommended as he did for one of the Mendelssohn preludes, 'to shoe your fingers with iron.' Besides Brahms, of the modern school, he had great affection for Mendelssohn and for Raff. Schumann he did not like so well.

"Prodigious as his memory was, it failed him sometimes, and some of the most amusing Bülow anecdotes relate to his ingenious devices for covering up the slip. In the midst of the great fugue in Beetho-

ven's sonata, Op. 109, he lost himself and promptly pulled out a large handkerchief and mopped his face and head as though he had stopped on account of the heat. Then he carried the fugue through to a triumphal finish. On another similar occasion he rushed from the room and swore that the piano must be tuned before he could go on.

"Bülow was probably the most eccentric artist that ever lived. Once he stopped abruptly and demanded that the ushers turn the piano around. When his reason was asked, he replied that a certain lady in the audience annoyed him unspeakably by fanning herself out of tune. When it was suggested that it might be simpler to ask the lady to stop, he said he could not think of giving her so much trouble, and the piano was turned.

"Some of the best Bülow stories are those which pertain to his orchestra conducting. With him the *vox populi* was far from being the *vox Dei*, and he always made it a point to do as he pleased—if he wanted to. On one occasion the orchestra which he was conducting had just given an immense Brahms symphony, very long and ponderous, and quite beyond the comprehension of the audience. When the audience, whose main sensation was one of relief that it was over, failed to applaud as enthusiastically as Bülow desired, he turned around and remarked to them in his energetic way, 'What, you do not like it ? I will teach you to !' and he made the orchestra play the entire composition through again, from beginning to end. Brahms was always applauded after that, if only in self-defense.

"On another occasion, by the way, he manifested exactly a contrary spirit. When a Leipzig audience insisted on recalling him in spite of his repeated refusal to play again, he came forward and said to them very emphatically, 'If you do not stop this applause I will play all of Bach's 48 Preludes and Fugues from beginning to end !' The audience laughed, and, it is needless to say, did not insist upon the recall."

AMERICANISM IN MUSIC.

IN *Music*, Arthur Weld throws a dash of cold water on the ardent enthusiasm of the magazine writers who for several months have been urging the establishment of an American school of music. These persons, Mr. Weld confidently asserts, will never see their "apparently hopeless and possibly undesirable ambition realized ; no, not they nor generations of similar 'patriots' after them in this century or many to come." His whole argument to support this assertion is suggested in the following question : "How can we be expected to have an 'artistic atmosphere' in a country which is sternly obliged, however unwillingly, to either borrow or steal its art from the rest of the world wherever it can find it ?"

"We have produced," says Mr. Weld, "thousands of artists in the abstract sense of the word, but they are necessarily more or less imitative, and their work, bearing as it must the distinct stamp of those

national influences of some other nation under which it was nurtured and perfected, is wholly lacking in even the rudimentary requirements of those conditions which might point out even the future possibility of an American 'school.'"

MORTGAGE BANKING IN AMERICA.

MR. D. M. FREDERIKSEN, in the current number of the *Journal of Political Economy*, of the University of Chicago, makes a careful résumé of the valuable returns to the last census on the subject of mortgages. His conclusions are important from the point of view of the mortgage borrower as well as from that of the investor.

"It is apparent that, with the increasing abundance of capital and the rising value of property, not only the average life of the mortgages, but also the mortgage indebtedness itself, is increasing. In the West this increase seems to depend on the facilities for borrowing more than on anything else. The year when the greatest number of mortgages was recorded was 1887, which was the very time when the newly organized Western loan companies were finding it easy to dispose of mortgages in the Eastern States. There is nothing alarming, however, in this increase, as about 60 per cent. of the mortgages were incurred in purchasing, and about 20 per cent. for the purpose of making improvements. On the whole, therefore, the borrowers are not spendthrifts; but, on the contrary, persons whose circumstances are improving, largely, no doubt, laborers in the cities who have bought homes, and young farmers in the West who have not yet paid for their farms."

MORTGAGE COMPANIES.

"Probably the origin of most of these companies is closely connected with the homestead laws, most of their business having been the making of loans to the new settlers as soon as these had lived long enough on their land to obtain a patent from the government. And the fact that many of the settlers in such States as Dakota, Nebraska and Kansas have taken up claims without making valuable improvements on them, have obtained title, mortgaged the land, and then immediately abandoned it, has been detrimental to several companies that had been led too far west by the prospect of obtaining large profits. Other companies have suffered on account of crop failures, and others again because their managers were unable to resist the temptation to use their institutions for the purpose of floating new speculative enterprises."

HOW THEY SHOULD BE INSPECTED.

Mr. Frederiksen deduces a few rules to be followed in investigating the condition of a mortgage company:

- "1. Examine its loans.
- "2. Consider its amount of unguaranteed loans as compared with its capital; whether its officers can personally supervise its business in detail; whether the property on which it loans is good revenue prop-

erty; whether the laws in the community in which it places its funds are favorable; whether it takes second mortgages or cash for commissions.

"3. Whether the management has had a number of years of successful experience in the business; the proportion of the capital of the company owned by officers and managers; field of operation; amount of guaranteed loans; number of foreclosures.

"4. Proportion of actual cash paid in as capital to volume of business; policy in regard to accumulating surplus instead of dividing the earnings.

THE MORTGAGE SYSTEM AS IT IS TO-DAY.

"The advantages and disadvantages of the present system may now be considered first from the borrower's and then from the lender's point of view.

"For the borrower, the manner in which mortgage loans are made in America to-day is both expensive and inconvenient. A loan is usually obtained through an agent or broker, whose commission is rarely less, and on farm mortgages often more, than $2\frac{1}{2}$ per cent. on a five-year loan, the commission thus averaging rather above than below 10 per cent. of the whole amount of interest paid, and on Western farm loans it is safe to say that 20 per cent. of the entire amount of interest paid during the life of the mortgage would be nearer the average commission than 10 per cent. The average cost of a loan to the borrower is thus considerably more than the rates of about 7.50 per cent. as given by the census. Even at so high a rate, it is not always easy to obtain a loan. The mortgage loan companies are often temporarily short of available capital; the brokers will promise to make the loan, but it often takes weeks, and even months, before they succeed in procuring the funds. This applies both to country and in a less degree to city loans, and is not a desirable state of affairs from the point of view of the borrower.

"From the point of view of the investor, the direct purchase of a mortgage which is not guaranteed by a firm of bankers, or by a responsible loan agent or company, may be a thoroughly safe investment; but it is entirely satisfactory only when the investor is personally familiar with the property mortgaged, and can always be present to see that the taxes are paid, to see that the insurance is kept up, and when, furthermore, he is able at any time to take steps to protect himself in case of default. Generally speaking, a single mortgage is not as safe as a debenture bond, because the mortgages deposited with the trust company mutually insure one another, and because the whole issue is further guaranteed by a company with some capital of its own. And even though the security may be good, and while there may not be any prospect of actual loss by a person owning a separate mortgage, it should still be considered that there may be both trouble and delay before the money can be obtained. As the law of foreclosure differs in different States, this difficulty is felt especially by non-resident investors, who have large amounts invested in other States, a portion only of which is guaranteed by the mortgage companies, brokers and agents."

EUROPEAN MORTGAGE BANKING.

The writer examines the systems in vogue abroad, especially the Credit Foncier of France and the German companies. The figures obtained from the latter are quite remarkable.

By making safe loans on income-yielding properties only, and issuing listed bonds, the German mortgage concerns have thus been able to obtain from the public to be lent on mortgages, the sum of about 5,000,000,000 marks, at about $3\frac{3}{4}$ per cent.

"When we consider the low rate of interest drawn in America by railroad bonds, municipal securities, etc., there is no reason to doubt that, with proper methods, similar results could also be accomplished here, and that thus the high rate of interest, the great evil exhibited by the census returns, could be abated. A greater supply of capital for mortgage loans would facilitate not only building operations in the cities, but also the purchase of implements, tile drainage and other improvements in the country. A better system of mortgage banking might also counteract a tendency which now seems to be operating, to change the landed system of the United States from one of proprietors to one of tenants."

True Meaning of Farm Mortgage Statistics.

Mr. Edward Atkinson also analyzes the figures returned in the census reports, in the *May Forum*. His conclusions are far more optimistic than are those of the writer in the *Journal of Political Economy*. "Dealing with the mortgages on farms, we find that the average life of a farm mortgage is a little less than five years—rather longer in the East than in the West, but practically five years in the grain-growing States. The total number of mortgages given on acres, which were outstanding in the United States, January 1, 1890, was 2,302,941, carrying an incumbrance of \$2,209,148,431. The average farm mortgage was therefore \$959. Again, we find that by far the greater number of these mortgages are for medium amounts. Over 6 per cent (6.11) were executed for sums under \$100; 46 per cent. were for sums under \$500, and 70.21 per cent. were for sums under \$1,000—leaving less than 30 per cent. in point of number as representative of larger mortgages, the biggest of which are in the Territory of Arizona.

THE INCREASE OF A DECADE.

"We may now begin to throw a little light upon the true nature of mortgage indebtedness by the figures of the increase. Let me repeat: The growth of population was 25 per cent.; the number of mortgages executed in 1889 as compared with 1880 shows an increase of 90 per cent.; the amount of mortgages registered, an increase of 156 per cent. To the superficial mind this may give evidence of hardship, but it is a notable fact that the lessening of mortgages in number and amount was during the period of business depression in 1883 and 1884. The average number of acres to each mortgage in the decade was 118; the number of acres encumbered in ten years 622,855,091. The total acreage of the United States ex-

clusive of Alaska is 1,900,000,000. Nearly one-third part of the acres of the United States were, therefore, placed under mortgage in the decade named. The debt increased three times more than the estimated wealth, and six times more than the population. The rate of interest on actual farm mortgages in twenty-one principal States, selected for this specific analysis, varied from $5\frac{1}{2}$ per cent. in Massachusetts to 6 and 7 per cent. in the Middle West; rising to 10 per cent. in the recently occupied States and Territories, averaging on farms a fraction under 7 per cent. This rate was much lower than in the previous decade on a paper-money basis.

THE BORROWER IS THE GAINER.

"In order to bring out the evidence of prosperity rather than adversity developed in these conditions, one must ask, What does a man in fact borrow when he executes a mortgage upon land? He does not borrow money in a true sense. In a vast number of cases only a title to money passes in the form of a check, a draft, or a bill of exchange. What he in fact borrows is the land itself, or such part of it as the encumbrance represents. If we regard foreclosure as a sign of lack of benefit to the borrower, the figures show that in all but an insignificant proportion of these negotiations it has been as much or more to the advantage of the borrower to borrow the farm or home as it has been to the benefit of the lender in securing interest on the loan. The advantage is mutual, but distinctly greater on the part of the borrower, who has been enabled to become the owner of a homestead and the improvements thereon at lessening rates of interest throughout this period. . . .

WHO ARE THE LANDLORDS?

"In 102 typical counties selected from all portions of the country for the purpose of a special investigation by the census authorities, it was disclosed that 68.69 per cent. of the mortgages incurred were held by citizens of the same States in which the mortgaged real estate is. Many of these prosperous farmers have retired to towns and cities in order to educate their children and to enjoy in their latter years some of the privileges of town life,—their early life having been passed in isolated places under very arduous conditions. In many cases their farms are let to their sons. In many other cases men who have not retired have leased a part of their farms to their children. In many others, again, those who have retired have let their farms to men formerly in their employ. A very small proportion are hired by farmers who have been unable to pay mortgages which have been foreclosed, who now lease the farms in the hope of recovery. There are great numbers of men who have served as hired men on farms, who have laid up their earnings, and who prefer to hire land in the neighborhood where they are known, and where they can have the benefit of schools and good surroundings, rather than to move away to take up new land on the outskirts of civilization.

"The evidence is conclusive that the increase of

hired farms does not imply the permanent establishment of the relations of landlord and tenant after the English fashion. It does not imply the concentration of land in fewer hands, but rather the reverse. It does imply better and more intelligent methods of agriculture, larger and more varied crops produced from lessening areas of land throughout the whole great grain-growing section. This change to more varied crops long since became the rule in the East when the wheat and the corn of the West began to press upon Eastern markets, as the cost of transportation was reduced."

THE DEMONETIZATION OF SILVER.

PRESIDENT ANDREWS, of Brown University, in giving an account of the formation of the Bimetallist Committee of Boston and New England, in the *Quarterly Journal of Economics*, writes as follows concerning the demonetization of the white metal:

"Much has been made of the fact that gold monometallism spreads as it does from country to country. Soon after Germany demonetized silver, the Latin Union ceased coining it for standard money, as did Russia and Holland. The Scandinavian States went further, extruding it from their currency altogether, save for subsidiary coins. Roumania later followed this example, and, still later, Austria. Holland plants her colonies as well as herself upon the yellow metal, and now Great Britain attempts the same with her immense Indian empire. People point to this steady march of the sole gold system as if it were beyond question a phase of advancing civilization. Commerce, it is declared, is tired of silver; only gold will satisfy it. This is a natural law of progress, and it is irrational as well as useless to oppose it."

NOT A RATIONAL MOVEMENT.

"History has been reread since this thought gained currency, and has shown it to be an illusion. Gold monometallism has not been spread by any rational conviction, but by perverse legislation. The adoption of gold as the sole ultimate money by any considerable group of commercial nations compels contiguous States to follow, whether they will or not, irrespective of the rationality or intrinsic desirableness of the change.

"No doubt, since Europe closed its mints to the white metal, the gold system has obtruded itself upon one country after another in a perfectly natural manner; but this in no sort proves that the process was wisely begun. Disease works as naturally as health, devolution as evolution. The truth seems to be that, however natural what has followed, the demonetization of silver was not natural or the result of thought, but the reverse. The policy was not debated, but entered upon in entire blindness. Neither in England, in Germany, nor in the United States, the lands where it was inaugurated, was any legislator at the time awake to the stupendous significance of the act. Hardly a man in public or in

private life then so much as dreamed of its grave and far-reaching consequences."

HOW IT CAME ABOUT.

Dr. Andrews declares that England adopted gold in the eighteenth century, not because it was better fitted than silver for the purposes of business, but because the English law overvalued gold, making it hard for silver to circulate. His authority for this statement is Ricardo.

"Silver was demonetized, and Great Britain thus started upon a false track. The French mint, so near, doing bimetallic work for both nations, prevented the evil from at once revealing its virulence; and the high career of Great Britain commercially, prepared for when the nation was bimetallic, evolved through association the baseless idea that gold money and commercial greatness had some logical connection.

"In 1872-73 this idea greatly influenced Germany in favor of laying silver aside; though with it wrought also certain other motives, such as the wish for simplicity in monetary system, dislike of France, and, most of all, what so strongly inclined the Paris Conference of 1867 toward gold monometallism, the then plentifulness of gold. Demonetization of silver by the United States in 1873 was also motivated largely by the example of England and the thought of simplicity. That no partner to the deed understood or had seriously considered its bearings has since been abundantly proved. It is thus quite certain, I believe, that the ostracism of silver began in ignorance, not at all in that circumspection and deliberation which must have marked it, had it been a true instance of economic evolution, like the discarding of stage coaches or the abolition of slavery."

THE REFORM OF OUR STATE GOVERNMENTS.

MR. GAMALIEL BRADFORD in the May *Annals of the American Academy* discusses the question of how to reform our State governments, referring especially to the State of New York because of the Constitutional Convention being held there.

Mr. Bradford first speaks of the dangers arising from the preponderance of the legislative power. "That the people throughout the country," says he, "have come to distrust and fear the legislatures is evident from the tendency of constitution making and amendment, which is steadily toward restricting the powers of the legislatures. But such attempts must fail to effect any permanent or adequate reform, much for the same reason that it is useless to try to repair a leaking dam by plastering it from the outside.

"The same tendency is shown in efforts to improve the character of the legislatures. Such are minority and proportional representation, compulsory voting, female suffrage, acts to prevent bribery and corruption, urgent appeals to the voters to attend the primaries, better education of the people, and so on. But

these, again, cannot reach the want, because the main difficulty is not in the composition of the legislatures, but in their usurpation of executive power, and the fatal effects upon their character of their attempts to wield it.

"The real remedy is to draw the line clearly between executive and legislative power, to assign to each branch that which properly belongs to it and to secure each from encroachment by the other, by giving to both equal opportunities of defending their rights before that which, in this country, we regard as the final tribunal—the people. So far as my knowledge goes, no positive attempt in this direction has ever been made in any State government."

POWERS OF THE EXECUTIVE.

One of the duties which Mr. Bradford assigns to the executive is the guidance of legislation. He says:

"The guidance and the conduct of legislation is just as much executive work as administration itself. It is the part of the executive to submit such projects of law as it thinks to be necessary for the conduct of administration, and to ask at once for the law and the means of administering it. It is for the legislature to discuss and accept or reject those laws and to grant or refuse the money which they involve. Under our present methods, not only is the executive excluded from proposing laws at all, but the power is open to every individual member of the legislature, and any one of 200 or 300 men can, if he pleases, propose as many laws on as many different subjects. It is evident, therefore, if we take only one point of view, that such laws will not be adapted to the wants of administration, in which members are not directly interested, and for which they are not at all responsible, but to meet the pressure of private and local interests among their constituents. And this brings us to a very delicate question. By the vast mass of our people the executive veto is regarded as the palladium of our liberties, and to question its value is like questioning the authority of Scripture to a Calvinist of the strictest type. And yet, if one thinks of it, does it not seem the height of absurdity that the head of a complex administration should have no power with regard to rules except to say what he does not want? It is often remarked that the veto in Great Britain has never been exerted since the reign of Queen Anne. In fact, the veto is applied more or less, every year, not indeed by the executive, but by parliament to which it properly belongs."

Mr. Bradford continues with a plea for the appointment by the governor of all his subordinates and for the abolition of commissions which are so generally created by the legislatures, concerning which he quotes the words of Hon. Seth Low: "State commissions for any other purposes than inquiry are the most dangerous of bodies, because they exercise authority without responsibility."

Mr. Bradford also opposes the general custom of compelling gubernatorial appointments to be approved by the State Senate, and the plan of deciding elections by a plurality instead of a majority of votes. "The very basis," says he, "of popular government

or of democracy is that the majority shall govern. To say that the largest of any given number of fractions shall govern is a very different thing. There is a great deal of talk about minority representation. Under the plurality system there is a good chance that minorities only may be represented. It is as necessary in a democracy as in an army, that the members should be taught that they must pull together, and the way to do this is to require a clear majority of votes at every election. The means of obtaining this is the simplest in the world, and is practiced constantly in Europe. Every undecided election is followed in a few days by a second ballot between the two highest on the previous list, when a majority must result. The people would soon learn that they only give themselves extra trouble by scattering their votes."

THE ETHICS OF DEMOCRACY.

MR. F. J. STIMSON, in *Scribner's*, gives the results of a careful investigation into the character of American State legislation. He has examined and read over about 1200 laws passed by State and Territorial legislatures in 1889-90. These he classifies as "individualistic," "socialistic," and "unsocialistic."

SOCIALISTIC LAWS.

Of these three the "socialistic" class is the most interesting. The writer passes over the liquor laws of the different States as too familiar to need notice. "In 'the regulation of manufactures and trade' we include a large class of miscellaneous legislation; notably, and first of all, the regulation of railway rates, toll rates, express rates, telegraph and telephone rates, etc.; the propriety of which becomes less clear as we come to elevator charges, millers' tolls, cotton compress tolls, or matters of ordinary private business. Presumably, at least, the State will not again undertake to fix the price of a loaf of bread, as it did in the Middle Ages; though it may conceivably fix the size thereof. Then we have the statutes regulating or restricting the manufacture and sale of oleomargarine, the importation of cattle from other States, the sale of milk and the sanitary inspection laws of cattle and milch cows. And under this head belong the statutes requiring the inspection or official classification of all commodities dealt in by trade, the stamping of leather, official trade-marks, the official grading of the quality of goods.

LABOR LEGISLATION.

"Among the labor laws we may mention as examples first, of course, the eight, nine, or ten hour laws; laws prohibiting alien or convict labor; regulating the methods of labor in factories and mines; the method of payment—requiring payment to be made weekly or monthly, and to be in money, not in orders for supplies; prohibiting 'company doctors,' corporation insurance funds for laborers, factory stores and factory lodging houses; protecting the laborer's personal safety in mines or on railways, his health in factories; prohibiting any part of wages to be withheld as fines for imperfect work (though a

statute of this sort has just been held unconstitutional by the Supreme Court of Massachusetts as impairing free right of contract between employer and employee; laws providing for arbitration of labor disputes; prohibiting blacklisting of laborers to prevent their getting employment by others; laws requiring 'union labels,' thus recognizing the boycott; and laws requiring qualification for exercising trades and professions, from lawyers and doctors down to trainmen, telegraph operators and plumbers. Closely connected with this is the labor of women, laws requiring them to be given seats while at work, etc.; and the labor of children, laws prohibiting their employment under a certain age, or before they can read or write; but both we term 'allowable.' Then laborers are given a preference over other creditors in case of insolvencies or receiverships of the persons or corporations employing them; and in some States a mandamus will lie to compel the recovery of the bodies of miners lost in mines.

STATUTES TO REGULATE MEN'S CONDUCT.

"Liquor laws we have mentioned. In about twenty States the sale of tobacco to minors under fourteen or eighteen is made criminal; in a few the sale of cigarettes is absolutely forbidden; in three that of opium. Two statutes of Mississippi attempt to regulate morals in general. Drunkenness is in Minnesota declared a crime. And in all States, the more lax the divorce laws, the more strictly the statutes require the marriage laws to be complied with, and make criminal any breach of them. And throughout the country, the more free we find the relations of the sexes, the more strictly is open profligacy prohibited and condemned. The tendency of all law-made virtue to hypocrisy is already shown; and Mr. Howe, who has written perhaps the most striking picture of Western village life, has found it already necessary to sound the note of warning from his country town in Kansas.

NEW PUBLIC FUNCTIONS.

"Some States still artificially encourage immigration. Bounties are given to manufactories; beet-sugar and sorghum plants are artificially encouraged; in Mississippi all new mills are exempted from taxation for ten years. The bounty principle is a most dangerous one; but has crept so little as yet into State legislation that it may be stamped out. On the other hand, the extension of the functions of cities and towns is growing every year; a law has been defeated which would have engaged the city of Boston in the retail coal business; but water, gas, electric lights, bridges, free ferries, are undertaken to be provided by more towns and cities every year. In the West, there are beginnings of actual money-making business undertaken by towns outside the wants of their citizens, as, for example, beet-sugar plants, fish-culture and experimental business processes, or scientific and agricultural experiment stations. We all know that the principle is fairly and fully established that a town or city may light, warm, transport,

amuse, and instruct its citizens; give them free libraries, museums, parks, play grounds, base-ball fields, concerts and galleries; but hitherto it may give them only water, not food or clothing, unless they frankly become paupers. And the line has been clearly drawn at the point of entering by city governments into ordinary money-making business, requiring neither by natural conditions nor great complexity the public interference. I think it were well to keep it there."

A REMEDY FOR THE SWEATING SYSTEM.

A Lesson in Co-operation in Italy.

MR. H. W. WOLFF, in the *Economic Review* for April, has a very valuable and suggestive article entitled "A Defense Against Sweating." Mr. Wolff is the author of a handbook on "Popular Banks," and he begins his article by pointing out that by establishing co-operative banks workingmen's associations could be financed so as to enable them to enter the field of productive labor on their own account. He says this has been done in Italy, and he gives a very interesting instance in support of his assertion.

He says: "Money, however, is, after all, to be had for co-operative production, free from any taint of demoralizing gift or profit seeking loan, if you will but go the right way to work to secure it. Signor Luzzatti's 'Banche Popolari' have, indeed, quite conclusively solved the problem. They have even taught private capital, once the safety of the process was made clear, to render the same service—willingly, readily, fearlessly.

THE CABINET MAKERS OF MILAN.

"Something like three years ago a number of joiners and cabinet hands resolved not to stand such treatment any longer. Co-operation was spreading in Italy, and for the first time becoming really known to artisans. The Milan cabinet makers refused to associate themselves with the fighting trades unions. They thought it a pity to waste valuable time over unprofitable fighting when there was so much better work to be done. They decided simply to leave the 'sweaters' alone and set up shop for themselves. Shares taken up by the four hundred or so members, scattered over twenty-six villages, at £2 apiece, would provide a small fund for starting; business would add to that. And meanwhile the Co-operative Bank made them advances.

HOW THEY SUCCEEDED.

"They set promptly about their work, and the beginning of May, 1891, saw them installed in their own warehouse. Things were from the outset put upon a thorough business footing. Good work was insisted upon, and promptly paid for in cash. Every piece of goods entering the warehouse—most of it is done to order—is at once valued by experts. Of the value so ascertained the worker receives one-half down on the spot. The balance is paid not later than three months after sale. There is no 'truck,' there

are no deductions. The result was they made more than 50 per cent. profit on the shares.

"With good will and capable management the *Magazzini Generali del Mobilio* soon succeeded in securing for themselves a good position in the market. Their goods, it was found, could be depended upon; and, notwithstanding the high profit earned for their members, they could manage to sell at moderate prices. In addition they offered private customers a share of their gains—20 per cent. of the net profits made. Dealers, of course, receive the usual discount.

THE BEST HINT YET.

"I must confess that, in the course of a journey of economic inquiry, which took me from the Garonne eastward to the Valley of the Vistula, and southward to the banks of the Arno, I came across nothing which more keenly excited my interest.

"Here are, it is true, on a small scale only, but none the less effectively and conclusively, two important economic problems successfully solved, which have hitherto defied solution: 'Sweating' has been vanquished, and production has been organized on an entirely co-operative basis. It would all have been impossible without the presence of a co-operative bank, versed in the valuation of the security which alone workingmen can give, willing to do business with them *as* business, not as a matter of favor.

"The experience ought to be not without its lesson to those who in England aim at similar objects—the suppression of 'sweating' and the establishment of production co-operative in its strictest sense."

LIFE IN THE SICILIAN MINES.

MADAME JESSIE WHITE MARIO, with characteristic energy, has been devoting her time to an investigation of the conditions of labor in the Sicilian sulphur mines, and the results, published in two consecutive numbers (Feb. 1 and 15) of the *Nuova Antologia*, form a very important contribution to the elucidation of what may be called the Sicilian problem. These sulphur mines, situated in the inland and mountainous districts of the island, employ some 21,000 workers underground, and though less dangerous than coal mines they are more unhealthful owing to the sulphuric gases. Yet the government has done practically nothing to control the labor-conditions. Unlike other mines in Italy, the sulphur mines are the absolute property of the landlord on whose property they are found; the contractor who leases the mine pays over 50 per cent. of the profits to the ground landlord, and, as a consequence, keeps his men on starvation wages. The workers may be classed under two heads:

(a) The *picconiere*, or miner proper, who hews out the mineral with his pick-axe, and

(b) The *caruso*, or carrier, whose duty it is to carry the mineral in sacks or baskets on his back along the low, dark passages of the mine and up the steep incline leading to the surface of the earth.

A large proportion of these *carusi*, veritable white

slaves, are boys under fifteen, many as young as eight and ten, while here and there little girls are to be found amongst them. Where boys do not work for their own fathers or brothers, they are literally sold by their parents to other *picconieri*, for whom they are bound to work often for fifteen or twenty years before they can buy their discharge. Mme. Mario describes in her own words her first sight of these child laborers: "We stopped at the opening of a mine, attracted by a troop of children, bent low under the weight of the heavy sacks on their shoulders, with little lanterns on their heads, and with their hands clutching convulsively at their loads. Looking down, we watched those that were coming up, and who gave forth groans like the rattle of a dying man. They were all naked save for a simple loin cloth, dirty, breathless and dripping with perspiration. . . . I looked at them well. All had red and swollen eyes. The bigger they were the more obvious were the effects of their laborious lives. The enlargement of the knees contrasted strangely with the slenderness of the legs and arms, that seemed to consist only of skin and muscle. Some were suffering from spinal curvature; others had a lump on the left shoulder. Yet they seemed cheerful and made no complaints. . . . For myself, I have never seen a more depressing spectacle, not even on the battlefield, or on the banks of the Po and the Adige when the victims of an inundation are flying from death."

The loads carried by the boys should not rightly weigh more than 40 kilos, but frequently they stagger up the incline under 60 or even 80 kilos, while their work lasts from eight to ten hours a day. Needless to say, none of these children can read or write. That the race is physically degenerating under such early and excessive labor may be gathered from a single eloquent fact: "In the province of Caltanissetta, during the four years from 1881 to 1884, of 3,672 miners who presented themselves under the conscription law, only 253 were pronounced capable of military service."

The wages of the miner are inconceivably small. His average earnings per day are only 1.78 francs, but as owing to the depressed condition of trade he has many enforced holidays, his total earnings of the year barely amount to \$80! Moreover, his wages are paid not weekly, but quarterly, and the truck system—originally introduced, it is said, by English speculators—being in full force, he is compelled to spend the greater part of them at the official tally shops in buying inferior goods at vastly enhanced prices. His food consists mainly of polenta and impure water—wine is a luxury reserved for Sundays—and his house is a wretched one-roomed hovel totally devoid of any sanitation. Yet, in spite of all these hardships, Madame Mario is able to assure us that the Sicilian miner has many good points: he is generous, courageous and fairly sober, goes to mass on every *festa*, is affectionately disposed towards those who treat him well, but grows rebellious and vindictive when treated with cruelty and disdain. One cannot but feel that his present condition is specially adapted to bring out these latter characteristics.

FRANCISCANS OF THE NINETEENTH CENTURY.

IN the *Contemporary Review* there is an admirable article by Mr. Walter Besant on the Jubilee of the Ragged School Union of London. It is partly historical, partly prophetic. Its note is that personal service is the only way by which men can be saved. The Ragged School Union has 4,000 unpaid workers, and no one knows how many more there are of these Franciscans of the nineteenth century.

Mr. Besant says: "It would be interesting if we could get the statistics of voluntary and unpaid work. I once investigated the statistics of a single parish, and that a very poor one. I found over one hundred persons who gave their work for nothing to the parish. In fact, there are thousands and tens of thousands on whom the Churches can now reckon for voluntary work. This unpaid worker is the nineteenth century Franciscan; he attempts, without vows, what his predecessor of the thirteenth century attempted with the help of vows—viz., organized personal service among the humblest. He works upon the lowest and most unpromising material that the world can show; they are lads far below the reach of Polytechnics; he attracts them somehow; by personal magnetism, by force of character, by skill in the things that all lads admire; he dominates them. He is perhaps a young curate of no great intellectual grasp; but he knows what he has to do, and he succeeds; or he is a layman who works in an office all day. We go back to the grand discovery of Francis—say rather, the interpretation of Francis—that the great sluggish apathetic mass in which are born creatures of hideous mien and malign brain can only be moved by personal service.

"Observe, also, that this form of philanthropic or charitable work is destined to be the only form that will survive and remain. Every other form will be speedily swallowed up by the action of the State."

Mr. Besant describes the transformation which has been wrought in the last fifty years by the recognition of personal service as the only form of charitable work which is truly effective and not mischievous, and which he thinks dates from the formation of the Ragged School Union. Those who are inclined to despair of our great cities will do well to read Mr. Besant's picture of what they were sixty or seventy years ago. Mr. Besant says that the lowest depths ever touched by the population of a great city seem to have been reached by the London mob at the end of the last century. Everything has now been changed, and by the discovery that the Christian Church might be the most potent engine ever given to man for civilization and education.

Mr. Besant puts the difference between the old and new conception of Church work very forcibly in the following sentences: "The old Reformation theory of the clergy—that their chief duty was to preach—still lingered; the modern opinion is, as we know, that the parish clergy are to be teachers and schoolmasters, almoners, providers of holidays, entertainments, concerts, meetings and clubs; civilizers, gymnasts and athletes, presidents of branches, ac-

tively engaged in every social, moral and religious object; acquainted with every person in the parish, readers of daily services, and, last of all, as of least importance, preachers. Fifty years ago they were preachers first and always." As a result, not merely have thousands of lives been rescued from infamy, but whole classes have been lifted to a higher level.

A FAR-REACHING CHARITY.

THE important work of the Iowa Russian Famine Relief Commission in 1892 is described by Mr. B. F. Tillinghast in the April and May numbers of the *Midland Monthly*. The Commission had the valuable co-operation of the National Society of the Red Cross, under the efficient direction of Miss Clara Barton.

"It was deemed best not to send any money abroad. There were two reasons. Its value in food bought here would be greatly increased. Free carriage to the interior of Russia was promised, thus adding a three-fold power to every dollar. It was also wisely determined to convert all money advanced into shelled corn, if possible in the locality where the money was given. Farmers could furnish grain often with less trouble than cash. . . .

"This far-reaching charity of Iowa was supplemented and rounded continuously. Transported to the metropolis without charge, as it had been gathered without payment for any personal or other attention, it was unloaded, inspected, stored in elevators, and insured, without expense. The agent of the Iowa Russian Famine Commission, upon arriving in New York to formally present Iowa's gift to the Red Cross, was asked to supervise the loading of the steamship *Tynehead*, to pay for the charter and insurance of the cargo. He was handed a power of attorney and a check for \$20,000 on the Chemical Bank of New York, both drawn by Miss Barton. This money was raised in part by the people of Washington, the children of the White House giving of their earnings. The steamship agents gave their commission, \$212; the freight brokers did likewise in the amount of \$156; the insurance brokers tendered their services, and the insurance companies, for the most part, contributed their premiums. The value placed on the cargo and charter was \$83,500. The cost of the charter was \$12,651.62.

"The first cars of corn were shipped the second week in February; the last cars on the 1st of April. In all 225 carloads, exceeding 500 bushels each, were sent out of Iowa. A few of them contained flour. The work of shelling, loading and clerical care required in billing was not small. Particular attention was paid to the grade and condition of the grain put into every car, since damp corn would grow more damp on the way. Attached to either side of every car was a large placard with a red cross made conspicuous. This was a talisman everywhere. All cars were consigned to Miss Barton in New York, and all reached her agents there without accident.

THE CHINESE SIX COMPANIES.

FONG KUM NGON, who, as his name would suggest, is of Chinese descent, sets forth in the *Overland Monthly* for May, for the benefit of Americans, the workings of that powerful organization in California known as the "Chinese Six Companies." The writer states that the materials contained in his article have been obtained from interviews with the president of the Ning Yung (one of the Six Companies), the president of the Meeting Hall of the Middle Kingdom and some pioneer Chinese who have been in the United States since soon after the discovery of gold in California.

THE CLAN SYSTEM.

Fong Kum Ngon first points out how very difficult it would be for one not having an intimate acquaintance with Chinese language and customs to understand these peculiar organizations, and proceeds forthwith to explain to the American reader that the companies are an indirect outgrowth of the clan system of China. There all the descendants of a common ancestor usually live together in a village or a group of villages. The Chinese who came to this country soon after the discovery of gold in California, however, belonged to many different clans. Of the various elements of the world that inhabited California at that time, the unfortunate Mongolians were the weakest; hence all others would oppress them. To protect themselves against their tormentors, all the various clans decided to adapt themselves to the new situation by banding together. A society was formed, with San Francisco for its headquarters, which was to represent the whole Chinese population in America at that time. Besides affording protection to residents, another of its objects was to assist newcomers. Some of the Chinese who had never been away more than fifty or sixty miles from their birthplace were unable to take care of themselves when they first arrived here. "When a ship arrived at San Francisco from China the society sent some wagons to bring the newcomers and their baggage up to Chinatown. The society also supplied the newcomers with room, water and wood for a month or two, until they could go into the mines or other occupations. Of course, this help was invaluable to the newcomers who had no relatives or friends here; even in the case of some who were entertained by relatives or friends, the latter reported to the society the aid they gave and were paid according to their services."

A MUTUAL BENEFIT FUND.

To provide the necessary means for helping the new immigrant the society decided to levy a tax of a few dollars on every Chinaman who returned to his native land. "At the present time each Chinaman who is about to leave this country for China pays \$9, of which \$3 goes to the 'Meeting Hall of the Middle Kingdom,' \$3 to the society to which he belongs, and \$3 toward the expenses for shipping the ashes of the dead to China. The Chinese generally come

up to the office of the society to pay the money and get their receipts while they are waiting at San Francisco for the steamer to start. The society always sends its inspector (interpreter) to the wharf to collect the receipts, and at the same time to assist the Chinamen on board the steamer. If the inspector finds any one without the receipt of the society, he asks him to pay the amount required by the society. If the individual fail or is unwilling to pay, the inspector tries with the aid of American laws to keep him from boarding the steamer. This, however, occurs very seldom."

In the beginning there was only one society for all the Chinamen in the United States. Now there are actually seven besides the Meeting Hall of the Middle Kingdom. "A little explanation of the fact of the changed number of societies may be desired by the reader. Having been accustomed to live with people of his own clan in China, a Chinese naturally seeks for the people closely related to himself or his immediate neighbors in the old country. But when they first came to the shores of America they could neither find relatives nor neighbors enough to organize any society. Therefore they had to associate with all that wore a cue. When there were more Chinese on this coast and each could find some of his relatives or neighbors, there was jealousy over the different offices of the society. For this reason they divided the society into several, according to the different districts from which most of the Chinese came to this country."

DO NOT IMPORT COOLIE LABOR.

Continuing, Fong Kum Ngon says the Six Companies have had nothing to do whatever with importing contract or slave labor, but that these contracts are made between the American employer and some one of the Chinese mercantile establishments in California. He also declares unfounded the charge that the Six Companies have their own court to try their own subjects. "The Six Companies have no more power to have a court of their own than the President of the United States has to compel the people to call him emperor. The Six Companies have only power to advise their people to do things, but not compel. Occasionally they hold meetings to settle disputes and debts in the same way as clan organizations in China. Instead of having the elders decide cases the merchants and prominent Chinese take their place. If the plaintiff and the defendant are not able to arbitrate the matter the case must be settled by the American law."

COLLECTING AGENCIES.

The Six Companies serve as collectors. "Sometimes a Chinaman owes another Chinaman money, and both live in other places than San Francisco. If the debtor tries to go back to China without paying his debt the creditor writes to the Six Companies about it. When the debtor comes to pay his dues to the Six Companies the officers of the Six Companies will tell him he should pay his debt before he goes. If the debtor is unwilling to pay, the Six Companies retain

him by the help of the American courts. We should clearly see why the creditor depends on the Six Companies to collect debts for him. It is because no one can detect the right man more easily than the Six Companies on account of the method by which they collect their own funds. We must remember that they send inspectors to the wharf to collect receipts.

"The reader must bear in mind that the Chinese custom of loaning money is very different from that of the Americans. A Chinaman often loans considerable money to one of his friends to help him to start business, not only without security, but even without a written word from the borrower. The creditor loans his money out, taking only the word of the borrower for it. The American law makes no provision to compel a man to pay his debts without any proof that he is a debtor. Therefore it is necessary for the Chinese creditor to depend largely on the Six Companies to collect his debts if debtors become unfaithful to their promises.

WHY THE COMPANIES HAVE INFLUENCE.

"If the Six Companies have no power to compel the Chinese to do things, why do they obey the Six Companies? would probably be the next question for us to answer. It may appear to those who do not understand the situation of the Chinese that the Six Companies have absolute power over the Chinese, because most of the Chinese seem to wait for these companies to advise them whether to register or not. The fact is this: The great majority of the Chinese in America know nothing about the laws of this country. On the other hand, they know that the Six Companies hire good American lawyers to advise them, and that men who are supposed to understand English and something about American law hold office in the Six Companies."

DIPLOMATIC AGENTS WITH "PARAMOUNT" POWERS.

THE *American Law Register and Review* offers two contributions to the discussion of the vexed question as to the President's authority to appoint a special diplomatic agent with paramount power, without the advice and consent of the Senate. Mr. Henry Flanders, fortified by the report of the Senate Committee on Foreign Relations, cites many precedents for such a use of the appointing power by our Presidents.

Professor Francis N. Thorpe, on the other hand, contends that the appointment of Mr. Blount differed from all precedents, in that paramount power was conferred on that commissioner. "Neither the Constitution nor the laws nor the force of custom gives authority to the President for such appointment as that of Mr. Blount. If the President may appoint a diplomatic agent with paramount power, the office of the Senate in the appointing power is superfluous. What shall restrain a President from appointing such a paramount agent to England, to Germany, or to France, where he shall be superior to the Ameri-

can Ambassador appointed by and with the advice and consent of the Senate? What Ambassador, Minister, Consul, *Chargé d'Affaires*, what Superintendent of the Mint, Collector of the Port, United States Marshal, Federal Judge, may not find himself under the authority of a paramount appointee of the President? Such an appointee may plunge the country into war, may strain commercial relations, may interfere with pending treaties, may ignore, or even defy, the legislation of Congress."

A PLEA FOR DISARMAMENT.

THE first place in the *Contemporary Review* is devoted to an article by Jules Simon, the object of which is to proclaim a truce of God to last from to-day until after the exhibition with which the twentieth century is to open. Parodying the old saying, "If you wish for peace, prepare for war," he says *Si vis pacem pare pacem*. He recognizes that the Triple Alliance, which was supposed to be a confederation of war, was made for peace. The Franco-Russian alliance must also make for peace. The Triple Alliance sought to give peace by reducing France to impotence, but the Russian alliance has given France resurrection, and peace now results from a common agreement of all powers. M. Simon asserts that even Austria, Germany and Italy have discovered that France is not longing for war, but that an immense longing for peace, as an opportunity for labor, has taken possession of all Frenchmen.

M. Simon eloquently describes the curse of military service in France. For three years the entire manhood of the nation is changed for the worse. The artist's hand has grown clumsy, and the morals of the young priests have been impaired. Soldiers refuse to go back to labor on the land. The villages are being depopulated. The germs of all diseases are found in the barracks. All the services of the State are famishing for money, while one-half the revenue is used for the purchase of powder, projectiles, fortresses and barracks. The European nations are rushing headlong to bankruptcy, and the end must come either by a war of extermination or by disarmament. The experiment of a universal war such as that which would be threatened if it once broke out has never been made in the history of the world. Eight millions of men will perish before the war is ended. Humanity will be put back six centuries in a single day.

What then should be done? M. Simon advocates an international conference to decide on the reduction of the term of service everywhere in Europe from three years to one: "The formula is clear and simple, and cannot give rise to two interpretations. It could be easily and promptly put in execution. In a year's time the whole thing would be done. The relative position of each power would remain just what it was before, as the change would apply equally to all, in accordance with the same formula. The economic result would be enormous. We could not, indeed, count on a reduction of two-thirds of the expenditure, on account of fortresses, military works of various

kinds, stores, and special corps; but we may confidently reckon on a diminution by half. It would be salvation! We should get back, little by little, to the expenditure of the years before the war; and the budget, already reduced by half, might still be subjected to reductions in other particulars."

Replying to the military argument that it would be impossible to make expert soldiers in twelve months, he points out that if the rule were made universal all would be equally inefficient.

WANTED, AN ASIAN TRIPLE ALLIANCE.

"WITH many of their former markets closing and closed to their goods," says Mr. Holt S. Hallett—in a discursive but suggestive contribution to the *Nineteenth Century*—"England's merchants and manufacturers are impelled to depend more and more on her great Eastern markets." "China, Japan, and Siam, together with our Asian possessions, contain more than half the population of the world—nine times more inhabitants than are contained in the whole of our non-Asian dominions. They are our largest, richest, and most promising markets. With the population of Great Britain increasing at the rate of a thousand souls a day, . . . it is a matter which touches every soul in the realm.

"If we lose India and our markets in the Far East, the United Kingdom, deprived of its largest areas for commerce, would dwindle, as Spain and Portugal did under similar circumstances, into a second-rate power.

"The contemplated completion of the Siberian Railway early in the next century, and the recent French annexations in Indo-China," are warnings which China is beginning to heed, and her consequent development of railways augurs a yet wider and more tempting market. Japan without a strong naval ally will soon be at the mercy of Russia. "The peace of Asia is threatened by the same aggressive nations who have turned Europe into an armed camp. Whether a secret alliance has been formed between France and Russia or not, both have placed themselves in a position whence they can trouble our Indian Empire and its neighbors. Both powers have greatly strengthened their fleets in Eastern waters as well as in those of Europe. Whether at present contemplated or not, a mutual attack by these powers upon India or China might be resolved upon at any time, and we are bound to be prepared for such an eventuality. . . . To insure the continuance of peace, and the maintenance of our great markets in the East, we must be fully equipped and ready for war, and determined to take the necessary steps for protecting our weak neighbor Siam, and for forming a defensive alliance with China and Japan, the two great native powers of Eastern Asia."

The writer urges the formation of a "League for the maintenance and extension of British commerce in the Far East," and points out the difficulties arising from the problem being as at present in charge of three separate government depots—the India, Colonial and Foreign Offices.

THE HOUR AND THE MAN IN SOUTH AFRICA.

The Story of Mr. Cecil Rhodes.

THERE is an article in the *Quarterly Review* on South African affairs which is chiefly interesting because of the painstaking attempt which the reviewer has made to present to the public the picture of one of the most remarkable men in the British Empire—Mr. Cecil Rhodes. The reviewer says: "Mr. Cecil Rhodes first became prominent on the stage of South Africa when all attempts at amalgamation of the diamond mines had broken down. He had been for some years in the colony, trying different pursuits with no very signal success, and finally had drifted to Kimberley, where he became connected with the De Beers Mine, even then one of the most successful, or rather least unsuccessful, of the half-hundred mines which were flooding the market and underselling each other.

"Mr. Rhodes effected the amalgamation of the Kimberley Mines, and the success of the project was attributed throughout South Africa entirely to Mr. Rhodes, and caused him to be regarded as the coming man. He soon let it be understood that it was in South Africa, not in the old country, he intended to make his career. He entered the Cape legislature as Member for Barkly West; he made himself a sort of dictator of the diamond fields; he took the lead of the English party in the Cape, and he made it manifest that he belonged to an entirely different class of politicians from those with whom the colony had hitherto been familiar. The truth is, that the hour had come for a new departure in Cape politics, and with the hour the man was forthcoming in the person of Cecil Rhodes.

WHAT MR. RHODES HAS DONE.

"It was by the advice of Sir Henry Loch, and at his instance, that the chairman of the De Beers Mining Company, and the creator of the Chartered Company, became also the Prime Minister of the Cape on the downfall of Sir Gordon Sprigg's Ministry in June, 1890. Since that date, Mr. Rhodes has remained in office; and his tenure of power has only increased his predominant influence in the colony. He has annexed Mashonaland; he is about to annex Matabeleland, and, if he can carry out his policy, these territories, though up to the present they are nominally crown possessions, will infallibly become part of the great Cape Colony. He has carried on the Great Northern railway right through Bechuanaland, which is regarded by the Cape as a territory destined very shortly to pass under its direct control. He has pushed forward the telegraph line, which it is hoped is one day to unite Cape Town with Cairo, far on its way toward Uganda. He has established friendly relations between the Cape Colony, Natal, the Orange Free State and the South African Republic; he has induced the Transvaal to abandon her policy of isolation, and to allow railway communication with Cape Town on the south and with Durban on the east. He has constructed the Beira Railway;

and he has brought the idea of a South African Customs Union, which was previously a dream of the future, within the domain of practical politics. And, what is more than all in the opinion of his fellow-colonists, he has proved, or is at any rate believed to have proved, that colonial troops are quite competent to subdue any of the native warlike tribes without Imperial aid, either in troops or money.

"Even if his endeavors should be frustrated, his Ministry overthrown, and his influence impaired by financial difficulties—contingencies which in such speculations as those on which he has embarked are always possible, if not probable—he has established the foundations of a united South Africa. Whether this union, when established, is to remain part of the British Empire or an independent republic, is a question which, as we deem, will be settled much more by the action of England than by that of the colony.

HIS POLICY FOR SOUTH AFRICA.

"The four main features of his policy may be said to be—South Africa for the Afrikanders; the gradual absorption of all territories lying south of the Zambesi in some description of federal union; the regulation of the native and labor questions by the States composing the union, and the maintenance of the Imperial suzerainty of Great Britain.

"In advocating this policy, its author believed himself to be securing the best interests of his mother country as well as of the colony. Mr. Rhodes is an Englishman to the backbone, and a strong and persistent advocate of the ideas which underlie all projects of an Imperial Federation under the flag of England. But he is also convinced, whether rightly or wrongly, that such a federation is only possible if our colonies, or rather our groups of colonies, are allowed actual, if not nominal autonomy, with respect to the administration of their internal affairs. If the spirit and temper which have characterized the recent attacks on Mr. Rhodes, the Chartered Company and the so-called 'forward' policy of the Cape Colony should be displayed by any considerable party at home in their future dealings with South African questions, the colonists will undoubtedly learn to look forward to the formation of a United South African Confederacy as the means not for consolidating, but for severing, the connection between the mother country and her South African possessions."

Lord Randolph Churchill's Estimate of Mr. Rhodes.

In an article in the *Revue de Paris*, Lord Randolph Churchill attempts to tell French readers something of what Great Britain is doing for the extension of her empire, and he pays the following tribute to Mr. Cecil Rhodes: "One cannot speak of the Africa of to-day nor of the Africa of to-morrow without referring to Cecil Rhodes, probably the best known and the most powerful colonial statesman of this or any other period. Born some forty-one years ago at Bishops Stortford, a little Essex village, where he spent his childhood, he was early destined for the

Church, but at the age of sixteen symptoms of lung disease showed themselves, and young Rhodes was sent to South Africa. This was in 1868. After spending a year on a Natal farm, he came back to England and went to Oxford, where he became known as a great sportsman, being indeed for some time master of the university draghounds. He has always remained faithful in his love for his university, and he is never in England without spending at least a few days in Oxford."

Lord Randolph gives a sufficiently succinct sketch of Mr. Rhodes' colonial-political career, and winds up with: "The history of Rhodes will be the history of South Africa. There is little doubt that he is now going to put in practice on a vast scale the lesson which he learnt when amalgamating the diamond mines. His plan is to weld together in one confederation all the South African States. Will his efforts be successful? The future alone can tell. But his achievements have already made it evident that his name merits to be written in letters of gold across the history of his adopted country."

THE BATTLE OF HASTINGS.

MR. J. H. ROUND, in the *English Historical Review*, replies to the defenders of Mr. Freeman's story of the famous battle of Hastings in a paper which is a fine specimen of close argument and vigorous reasoning. It is not necessary to follow him *seriatim* through his reply to Mr. Freeman's champions, and we content ourselves with extracting his own summary of what he claims to have accomplished in his criticism of Mr. Freeman himself: "As against Mr. Freeman's account of the battle, I claim *first*, as I have claimed throughout, that, on a review of the whole evidence, he has certainly failed to prove the existence of that 'palisade,' which would, he admits, have been a new development, and which, therefore, requires conclusive proof; *second*, that his disposition of the English, 'with all that it involves, was based on no authority, was merely the offspring of his own imagination, and was directly at variance with the only precedent that he vouched for the purpose;' *third*, that the advance of the Norman infantry was not for the purpose of breaking down the alleged 'palisade,' but solely to gall the English and tempt them to break their ranks; *fourth*, that the great feigned flight was not a single but a combined manœuvre; *fifth*, that the 'great slaughter of the French in the western ravine' was an episode 'invented by Mr. Freeman alone,' was at variance with his own conditions of the problem, was opposed by Mr. Archer's authority, Wace, and involved the application of 'violence' to his own 'leading authority;' *sixth*, that 'his explanation of how (*sic*) the battle was won,' namely, the outflanking of Harold and the centre by the Normans gaining the hill on his right, 'is a mere unsupported conjecture;' *seventh*, that he was misled, at the outset, by 'misconstruing' the words of Henry of Huntingdon on which alone can rest his statement that the post 'was not without

reason called a fortress.' I hold, therefore, that his narrative of the battle will have to be entirely rewritten and its ground plan destroyed."

REMINISCENCES OF GENERAL GRANT.

THE *May McClure's* is quite a "Grant number," presenting, as it does, several short incisive articles on the General by those who knew him and fought with him, and containing a score of pictures of him taken at many turns of his life that present a special interest. General Horace Porter writes on the great and noble characteristics of General Grant.

HE WAS TRUTHFUL TO A DEGREE.

Among them he puts truth first, closely followed by courage, modesty and generosity. "He was," says General Porter, "without exception the most absolutely truthful man I ever encountered in public or private life. This trait may be recognized in the frankness and honesty of expression in all his correspondence. He was not only truthful himself, but he had a horror of untruth in others. One day while sitting in his bedroom in the White House, where he had retired to write a message to Congress, a card was brought in by a servant. An officer on duty at the time, seeing that the President did not want to be disturbed, remarked to the servant: 'Say the President is not in.' General Grant overheard the remark, turned around suddenly in his chair, and cried out to the servant: 'Tell him no such thing. I don't lie myself, and I don't want any one to lie for me.'"

A MAN WITHOUT PHYSICAL FEAR.

Of Grant's courage, General Porter remarks that he always showed the most remarkable freedom from even the excusable reflex nervousness that comes to almost all men on the field of battle.

"His courage was conspicuous in all the battles in Mexico in which he was engaged, particularly in leading an attack against one of the gates of the City of Mexico, at the head of a dozen men whom he had called on to volunteer for the purpose. It showed itself at Belmont, in the gallant manner in which he led his troops, and in his remaining on shore in the retreat until he had seen all his men aboard the steamboats. At Donelson and Shiloh, and in many of the fights in the Virginia campaign, while he never posed for effect, or indulged in mock heroics, his exposure to danger when necessary, and his habitual indifference under fire, were constantly noticeable. He was one of the few men who never displayed the slightest nervousness in battle. Dodging bullets is by no means proof of a lack of courage. It proceeds from a nervousness which is often purely physical, and is no more significant as a test of courage than the act of winking when something is thrown suddenly in one's face. It is entirely involuntary."

NO MUSIC IN HIS SOUL.

Like many great soldiers, Grant did not understand or care for music. General Ely S. Parker says:

"General Grant had no ear for music, and I shall

close these little random reminiscences with an anecdote illustrating this defect. If, as we have been told, he who has no music in his soul, is fit for 'treason, stratagems and spoils,' General Grant must be classed among the exceptions to this general statement. It was a frequent remark of his, that he did not know one tune from another, except 'Yankee Doodle,' 'America,' and the 'Star Spangled Banner.' I recollect in 1870 once dining informally with him and his family in the White House. He had just been to Philadelphia, and while there was persuaded to attend an opera given at the Academy. My wife asked him how he had enjoyed it. He replied that he did not know. He had heard a great deal of noise, and had seen a large number of musicians, most of them violinists, sawing away upon their instruments. Here he exemplified by imitating with the carving knife and fork the actions of a violinist, and added that the noise they made was deafening, 'unintelligible, and confusing to him.'

GREAT IN TROUBLE AS IN PROSPERITY.

Nor was General Grant heroic only at the head of his troops and in the face of victory. In the disheartening business misfortunes that came later in life he showed himself no less worthy.

"He had been tempted to make an investment in business. He first put \$100,000 into the funds of Grant & Ward. He was one of the most innocent of the victims of that failure. His greatest mistake was in the permission of the use of his name in connection with the business of the firm. His special partnership made him liable for a very large amount.

"More than this, he was placed in a very cruel and embarrassing position in relation to Mr. William H. Vanderbilt. The night before the failure of the Marine Bank, which preceded the failure of Grant & Ward, General Grant called upon Mr. Vanderbilt and borrowed from him \$150,000. This was upon representations of Ward that the bank would need the money for only a day's loan. General Grant obtained this money, and it merely passed through his hands into the gulf of loss. General Grant corrected his position toward Mr. Vanderbilt in the only way possible. He sent to him the title deeds of his house, and turned over every bit of property owned by the family, even to his personal effects, which included all of the mementos and tokens received by him during his career as a soldier and a statesman. Mr. Vanderbilt acted with great generosity toward General Grant, and after the first explanation of the facts of the situation placed the blame for the transaction upon the shoulders of Mr. Ward. He even went so far in his generosity as to seek to cancel the debt of General Grant and to return the property in question to Mrs. Grant. As this property included her old home in St. Louis, it is but just to say that the generous offer was a tempting one, but it was not accepted. Mr. Vanderbilt, however, was able to do one very gracious thing. He presented the personal mementos and tokens to the United States Government. So completely had General Grant stripped himself to

satisfy this debt of honor from which he had not received one cent of profit that at the time of his death there did not remain in the possession of the family even a uniform to clothe his body nor a sword to lay upon his coffin."

GLADSTONE AND POPE LEO.

THE Scandinavian magazines for this month do not contain much that is of general interest. *Nyt Tidsskrift*, however, is good as usual, and contains, among other excellent articles, a fine and appreciative critique on Gladstone by Sigurd Ibsen, which opens with a comment on some striking resemblances between England's venerable hero-statesman and Pope Leo XIII.

LIKE TASTES AND SCHOOLING.

Apart from the coincidence that the two are of an age, they are almost equally endowed with literary tastes and literary powers. Gladstone is noted for his Homeric studies, Pope Leo for his publication of the philosophical works of Thomas of Aquino. Gladstone is a worshiper of the Greek philology, Leo XIII a master of Latin versification. Both lived their youth in an atmosphere of religious and political intolerance. The son of the wealthy Liverpool merchant was brought up in extreme Toryism; the scion of the noble family at Carpineto was bred in a Jesuitical college. Young Gladstone sat, in the first Cabinet of which he was a member, cheek by jowl with Wellington, most preactionary of all reactionary souls. Young Pecci made his destiny as prelate under Gregory XVI, that apparition from the Middle Ages who had worn the hood of the cloister and remained the fanatical monk even on the papal throne. As time passed on many prejudices were cast overboard; Gladstone worked himself upward to broad-mindedness, Pecci to opportunism. And so it has come to pass that we see the Conservative politician metamorphosed into a champion of liberty and an opponent of a State-established Church, and the priestly upholder of the principles of authority extending a conditional acknowledgment to modern science, lending a kindly ear to the burning social questions of the day, and giving the French Republic his moral support in its fight against monarchic tendencies.

At an early age both Gladstone and Pecci were fortunate enough to have won prominent positions. At something over twenty the one was already member of Parliament and Junior Lord of the Treasury; the other governor of the province of Benevent. Both celebrated last year a fifty years' jubilee, for in 1843 the one was for the first time Prime Minister and the other had donned the episcopal dignities. For the rest, the full value of both has received but a tardy acknowledgment, and well it is, says Ibsen, that a long life has been accorded them that they could afford to wait.

RENOWN LATE IN LIFE.

There are stars in the political firmament that, from the moment of their rising, have shone forth in their

fullest splendor. Of these were Cavour and Gambetta. But it was otherwise with Pecci and Gladstone. Cardinal Pecci lived for the space of an average lifetime, almost, a monotonous existence in silent Perugia, valued, indeed, by a narrow circle as a learned theologian and an able administrator, but that was all; and he was an old man before the world discovered all the resources that lay behind that nimble and inventive intellect. For years was Gladstone chiefly known as a pushing statesman of finance; slowly he made a name as the defender of the wronged, and only now at last has it been discovered to what a height his emancipated mind could rise. Had Leo XIII died in his seventieth year the renown of a Manning or a Lavignerie would have overshadowed his memory, and none would have known that our century could bring forth a Pope worthy to be the successor of a Gregory VII or an Innocent III. Had Gladstone died in his seventieth year, history had accorded him a place by the side of Peel or Russell, Palmerston or Disraeli, but would not have remembered him as the unique figure he now in his heaviest years has proved himself.

THE HUNGARIAN CIVIL MARRIAGE BILL.

IN the second April number of the *Revue de Paris* Ant. E. Horn contributes an article on the question which is now agitating not only Hungary but all the Vatican and Ultramontane party. The important question of obligatory civil marriage has now been for many years a burning question in Kossuth's country. Some twenty years ago, Francis Deak, who was called "the wise man of Hungary," pronounced himself in the last speech he ever uttered strongly in favor of the measure; but though the Hungarian Parliament was on the whole favorable to the project, there were many vested interests, prejudices and traditions opposed to making so startling an innovation in a country which, possessing no less than eight marriage laws, had always practically left the arrangement of this most important matter to the clergy of each denomination. This seeming liberty of conscience, though admirable in theory, worked ill in practice; the Roman Catholics followed ordinary canon law, and for them, of course, divorce is out of the question; the Eastern Churches each possess a special legislation which requires, before they will perform a marriage, the consent of both parents, and though rendering divorce comparatively easy, strictly forbids a widow with children to remarry after thirty, though a childless widow may marry up to four times till the age of forty! The Transylvania Protestants will not admit that a man should marry a woman thirty years younger than himself, or a woman twenty years older. The Eastern Churches are extremely strict as to the prohibited relationships, but the Jews encourage marriages between near relations, and, as is natural, each Church has its own theories about divorce; the Uniates admitting about one hundred causes of separation, including that of invincible repulsion! Thus it con-

stantly happens that a union considered indissoluble by the religious authorities of one of the two parties will be easily declared null and void by those of the other, and during the course of one divorce trial the parties interested have been known to change their religion five times in order to obtain their wish, and after all is over to become once more reconciled with their ecclesiastical authorities! Divorce is not the only reason given for these rapid "conversions;" they also take place in view of prospective matrimony, for the Greek Orthodox Church and the Transylvanian Protestants do not allow the guilty *divorcée* to remarry. As may easily be imagined, the question of the children is rendered even more difficult by this state of things, for mixed marriages form a considerable percentage of those contracted in Hungary, and whenever one of these takes place the priest, pastor, patriarch or rabbi of the contracting parties makes a determined effort to secure the spiritual well-being of his parishioners' future offspring.

To put an end to all these difficulties there seems one simple course—namely, to make one marriage law for all. Civil marriage, points out M. Horn, will not only put an end to these many anomalies, but will also tend to make marriage far more of an indissoluble union, for the causes of divorce will be necessarily restricted.

DAGNAN-BOUVERET, THE FRENCH ARTIST.

MR. WILLIAM A. COFFIN writes in the *May Century* of Dagnan-Bouveret, the artist, of whose most famous paintings there are in this article a half dozen reproduced by half tone in most attractive fashion, while an engraving of another one forms the frontispiece of the magazine. This frontispiece portrait is a rare example, by the way, of the ability of these clever Frenchmen to transmute a commonplace face into an artistic portrait that commands our interest.

Of Dagnan-Bouveret, Mr. Coffin says that sincerity is his most marked professional characteristic; that his admiration is Holbein; that he cares nothing for fashionable life, but lives solely for his art.

"In his studio and garden at Neuilly he works incessantly. Sometimes he goes to the country with his wife and son, and there too he works with equal ardor. A little story about the 'Horses at the Watering Trough' well illustrates the thoroughness of his methods. Dagnan was passing the summer at his father-in-law's place, and there saw the subject of this picture. His father-in-law entered with great interest into the project of making a picture of the farm horses, and arranged various devices to make the task of painting the picture from nature as convenient as possible. The summer wore on, and the picture progressed, but the way Dagnan paints a large canvas (or a little one, for that matter) takes time. So, at his father-in-law's suggestion, they took primitive sorts of casts of the horses' backs by laying over them cloths soaked in plaster of Paris, and when these were hard and dry, they were set up, and the

harness was placed on them just as it would be if the horses themselves were standing before the trough. And here every day Dagnan came to paint his straps and buckles, and before he had finished them to his satisfaction the snow fell on his palette as he worked."

TENNYSON SEVERELY CRITICISED.

A VERY trenchant critique on the late Laureate, written by the late Francis Adams, forms one of the most striking features in the *New Review*. There is an unusual piquancy in the freedom with which the great poet is handled.

THE POET'S SHORTCOMINGS.

The following sentences are given as examples:

"The sicklier side of the art of Keats and Shelley was absolutely to his taste. His one instinct is to look nothing in the face. He would make of life a pretty play. His touch is always felicitous, but the felicity is doomed to inferiority. He has against him the inevitable difference between enamel work and painting. The same timid artificiality still meets us at all points.

"The May Queen' stands for the first of those resolute bids for popularity which Lord Tennyson was always careful to reiterate. There are thirty-nine verses in this well-known poem. In twenty-eight of them one of the most perfect little female prigs in all literature takes an even more unconscionable time in dying than Charles II.

"As for making 'In Memoriam' a contribution to modern thought . . . this was obviously impossible for a man who had never given himself the trouble to think. Tennyson had no faculty that way. 'In Memoriam' would be one of the most dishonest works ever written by a man of ability were it not for a dozen snatches of sweet and true affection which he had in his heart of hearts for his friend. No criticism on him can better his own in that phrase of 'the imitative will.' We have him there, the intellectual side of him, complete.

"But what charming pictures he gives us of the quiet, radiant purity of his love, as it takes shape in his sorrow! And this note of sincerity, the true note, the characteristic note, the eternal note, he attains to now at last in another department of his work—in the department of the love poem.

A CRUCIAL CASE.

"Those myoptic stumblings of his manhood seem large and lucid beside the distressing mental collapse, the insane and incoherent rhodomontade of so much of 'Sixty Years After.' Unhappily, the same phenomenon is to be noted in a dozen other cases.

"King Arthur is a crucial case, because he is Tennyson's deliberate attempt to present to us an ideal figure of social manhood. He is 'like a modern gentleman of stateliest port.' The writer who could deliberately paint such a character as Arthur—as the Arthur of this culminant Idyll of Guinevere—and present it to us as his ideal of modern gentleness and modern manhood, never had the remotest conception

of what gentleness meant or what manhood meant. Nothing more essentially unmodern, more false to every notion we possess of true morality and true justice, has been written in our time, and perhaps in any time. The poetical works of Tennyson contain an amount of destructible matter which, in the immemorial phrase, is quite shocking. . . . Thirty or forty years hence the Matthew Arnold of the day will present to his public a similar volume of Tennyson, but it will be a slim one. . . . No ballad in our language is more redolent than 'The Revenge' of that heroic obstinacy which has made our race the stupid conqueror of half the earth. The poet's own 'last words'—'Crossing the Bar'—[are] perhaps the loveliest Christian lyric in our own or any language. It is here that once more we find him at his truest and highest and best."

HEINE AND LADY DUFF GORDON.

IN Heft 8 of *Vom Fels zum Meer*, Herr Sigmund Münz has an entertaining article on Lady (Lucie) Duff Gordon and Heinrich Heine. Lady Duff Gordon is the mother of Mrs. Janet Ross, the author of "Three Generations of English Women," "Early Days Recalled," etc.

It was at Boulogne, in August, 1833, that Lucie Austin first made the acquaintance of Heine. She was then a child of twelve, with large brown eyes and beautiful hair, and one day when she was sitting at the *table d'hôte*, she attracted the attention of Heine by the ease with which she conversed in German with her mother. He said to the child: "When you return to England, you may tell your friends you have seen Heinrich Heine." "And who is Heinrich Heine?" she replied; whereupon he was greatly amused, and he explained that he was a German poet.

Lucie and Heine soon became good friends, and they spent hours on the pier together, the child singing him English ballads, and the poet telling her wild tales of all sorts of fishes and mermaids, and of an old French fiddler who had a black poodle, and took three baths a day, and to whom the watersprites brought greetings from the North Sea. "Wenn ich an deinem Hause, des Morgens vorüber geh," is a poem in Heine's "Buch der Lieder," dedicated to his English child-friend.

Meanwhile, eighteen more years pass, and Lucie has become the wife of Sir Duff Gordon. In 1851, Lady Duff Gordon, now a woman of thirty, was staying in the house of Barthélemy St. Hilaire, at Paris, when she happened to hear that Heine was living quite near, in the Rue Amsterdam, and that he was ill and very poor. She sent to inquire whether he remembered the child to whom he had told such charming stories at Boulogne, and whether she might visit him. The dying poet desired to see her at once, and the two naturally fell into reminiscences of the happy days at Boulogne. He reminded her of the ballads she sang eighteen years before; but Lady Duff Gordon was deeply moved by his intense sufferings. His

voice was weak, but he spoke with remarkable vivacity. Clearly his mind had survived his body. He raised his powerless eyelids with his thin white fingers, and said, "Yes, Lucie has still the same large eyes. . . . Little Lucie has grown up and has a husband. That is strange." He asked whether she was happy and contented, and he hoped she was no less happy now than she was merry as a child. She replied she was no longer so merry, but she was happy and contented; to which Heine observed: "That is nice. It does one good to see a woman who does not go about with a heart to be healed by all sorts of men, as the women in France do. The French women do not know what is wrong with them; they have no heart at all."

In the autumn of 1855, Lady Duff Gordon spent two months in Paris. Heine had removed to the Champs Elysées, and there, too, Lady Duff Gordon was staying. The poet having heard of her arrival, scribbled in pencil: "Highly esteemed Goddess of Great Britain! I sent word by the servant that I am ready at any hour on any day to receive your godship. But I have waited in vain for such a heavenly vision. Do not delay any longer. Come to-day, come to-morrow, come often. You live so near the poor shadow in the Elysian Fields! Do not let me have too long to wait. Herewith I send you the first four volumes of the French edition of my unfortunate works. Meanwhile I remain your godship's most obedient worshiper.—HEINRICH HEINE."

Not many minutes after his English friend was at his side. She found him still on the mattress on which he was lying three years before. More ill he could not look, for his appearance was that of a dead person. He was truly but a shadow; by sorrow and suffering his features had taken on a certain beauty. He welcomed her with the words: "I have now made my peace with the world and with God, who has sent you to me as the beautiful angel of death. I shall certainly die soon. . . . I hardly know why I did not like the English, but I never really hated them. I was once in England; I knew nobody, and found London a very sad place, and the people in the streets intolerable. But England has avenged herself by sending me excellent friends—you, the good Milnes, and others." Milnes was the poet and politician, later known as Lord Houghton.

Lady Duff Gordon now saw Heine several times a week. He was interested in everything, but specially wished for a good English translation of his works. He pressed his friend to undertake it; offered her the copyright as a gift, gave her a free hand to cut out what she chose, and even drew up a plan for the arrangement of the poems. With childish eagerness he longed to see her at work, and recommended her to try a prose translation. In this she hesitated, but at last she read him a rendering of "Almansor," and he was delighted and more anxious than ever that she should promise to do the rest. A selection from Lady Duff Gordon's translations was published by Mrs. Janet Ross in *Murray's Magazine*. They include several pearls from the "Buch der Lieder,"

and verses from the "Lyrisches Intermezzo," "Neue Gedichten," and "Heimkehr."

Lady Duff Gordon cannot praise too highly the way in which Heine bore his sufferings. He was glad when his complaints brought the tears to her eyes; but if a joke of his made her laugh he would rejoice even more. He begged her not to leave him or say farewell forever. When he spoke German to her he addressed her with "Du," but in French he called her "Madame" or "Vous." He declared she could always laugh from the heart, which the French could not. He spoke to her of his religious convictions, and finally they parted in the hope to meet again in England, where he proposed to travel, to make reconciliation with the people against whom he had leveled his most biting sarcasm. But it was not long before he had entered into his rest.

TAINE THE HISTORIAN.

IN the *Revue de Paris* of March 15, M. Gabriel Monod tells the life of Taine the historian. M. Taine had a morbid horror of publicity, and always practiced the precept, "Hide your life, but show your wit." Yet, as his biographer very properly points out, in order to appreciate the latter it is necessary to know something of the former.

HIS EARLY LIFE.

Hippolyte Taine was borne at Vouziers on April 21, 1826. His father was a solicitor, and a very intelligent man, and it was he who grounded his son in the first elements of history. At the age of thirteen the boy was sent to Paris, where he studied for some time at the College Bourbon. Like most French geniuses he seems to have been singularly fortunate in his mother. "No other woman," he once wrote of her, "so thoroughly understood the science of motherhood." Even as a schoolboy he planned out his days moment by moment, his only relaxation being reading. Among his classmates were several lads destined to take a considerable place later. Among them may be specially mentioned Provost Paradol, Planat, and Cornelius de Witt, who introduced him to Guizot. At the age of twenty Taine entered the Ecole Normale. It was then that he first made up his mind to devote his life to the study of history past and present. Already an excellent English scholar, he learned German in order to be able to read Hegel in the original. He was popular both among the masters and his comrades. This sojourn at the Ecole Normale was perhaps the happiest period of his life.

AFTER LEAVING COLLEGE.

On leaving the college he was offered and accepted the post of Professor of Philosophy at the Toulon College. The *coup-d'état* had just occurred, and all government officials were ordered to sign an act of adhesion to the new government. Taine refused his signature, and was henceforth treated as suspect. After some months of considerable difficulty—for he was transferred rapidly from town to town, being scarce given time in each to form and start a class—

he made up his mind to abandon scholastic work, and throw himself into literature. He found a firm friend in Guizot, but years passed before his remarkable talents were in any way recognized. Indeed, his first literary success was due to his having been sent for his health to the Pyrenees. M. Hachette, the publisher, commissioned him to write a guide to that region. The volume with which he returned to Paris proved to be one of the most charming books of travel ever written. It appeared in the year 1855, with illustrations by Gustave Doré, and produced a considerable sensation. The same year saw his first article in the *Revue des Deux Mondes*. He was in his thirtieth year when the publication of his "Philosophes Français" brought him real fame. The book was discussed by critics belonging to every shade of opinion. Taine became a leader of thought. Renan, Sainte Beuve, Flaubert, and Gautier treated him as an honored comrade. His "History of English Literature," the work by which he is perhaps best known in France, appeared years later, but he was by that time one of the recognized forces of French intellectual life. At the age of forty he married, greatly to the astonishment of his friends, who considered him an ideal bachelor. His wife, *née* Denuelle, was the daughter of a well-known architect, and proved from every point of view a worthy helpmeet.

The last years of Taine's life were spent in Switzerland in a charming villa on the shores of the Lake of Annecy. There he and his wife entertained parties of their friends through all the summer months, and his death at the comparatively early age of sixty-five leaves a serious void in the world of contemporary letters.

A FELLOW HISTORIAN'S ESTIMATE OF PARKMAN.

IN the current number of the *Harvard Graduates' Magazine*, Mr. James Schouler, the accomplished historical writer, pays a noteworthy tribute to the late Francis Parkman, whose merits as a historian he summarizes as follows: "Thoroughness of preparation, a painstaking accuracy, justness in balancing authorities, scholarly tastes and comprehension, and the constant disposition to be truthful and impartial, to which were added skill and an artistic grace and dignity in composition. His style was crystal-clear and melodious as a mountain brook which flows obedient to easy impulse, setting off the charms of natural scenery by its own exquisite naturalness. The aroma of the woods and of the woodland life is in all his books, among which, perhaps, 'The Conspiracy of Pontiac' will remain the favorite. Here and constantly in dealing with the Indian, with the primeval American landscape and its primeval inhabitants, his touch is masterly and unapproachable; and so, too, in describing the sympathetic contact of France with a race which British interference doomed to destruction. French explorers, French missionaries and warriors, stand out life-like from these interesting narratives, since he wrote to interest and not merely to instruct. Generalization and the

broad historical lessons are to be found rather in the pages of his preface, as Mr. Parkman wrote, than in the narratives themselves, most of his later subjects being, in fact, extended ones for the compass of the book, and with his wealth of materials he kept closely to the tale. But in these preliminary, or rather final, deductions may be found pregnant passages of force and eloquence."

FLAMMARION THE ASTRONOMER.

ASTRONOMICAL geniuses are, to judge from M. Camille Flammarion's case, rather born than made. He was interested in the science of the heavens at the tender age of six; was the author of "The Cosmogony of the Universe" at sixteen, and at twenty had already made his reputation by the work called "The Plurality of Inhabited Worlds"—now in its thirty-fifth edition. He made his honeymoon trip in a balloon, and cannot be considered apart from his observatory.

Mr. R. H. Sherard tells us in the course of his character sketch of the astronomer, printed in the May *McClure's*, that the three achievements which to Flammarion seem the proud ones of his life, are the founding of the *Monthly Review of Astronomy*, which he supports, the establishment of the French Society of Astronomy, and the building of his observatory at Juvisy.

Mr. Sherard describes Flammarion's daily life as follows:

"His life is an extremely busy one. Besides his work as an astronomer, he still to-day fills many public positions. He is a modest man, and does not seem to care to speak about himself. It was his wife who gave me the following particulars as to his life and character on the day on which I called upon him. 'He is,' she said, 'an extremely methodical man. He gets up regularly every morning at seven o'clock, and spends quite a long time over his toilet. Servants, as a rule, are not very tidy, but Flammarion is an exception to the rule. At a quarter to eight every morning he has his first breakfast, at which he always takes two eggs. From eight till twelve he works. At noon he has his *déjeuner*, over which he spends a long time. He is a very slow eater. From one to two he receives, and as he knows everybody in Paris, and as he is constantly being consulted on all sorts of questions by Parisian reporters, he is usually kept very busy during this hour. From two to three he dictates letters to me, and as he receives thousands of letters from all parts of the world, especially when anything new in the branch of astronomical science is occupying public attention, my time is fully occupied. At three o'clock he goes out and attends to his business as editor of the monthly magazine which he founded, and to his duties as member of various societies. He is back home again at half-past seven, when he has dinner, and spends the rest of the day in reading. He is a great reader, and tries to keep himself *au courant* with all that is said on the important topics of the day. At ten o'clock he goes to bed, for he is a great sleeper.'

"'But when,' I asked, 'does M. Flammarion observe the stars?'

"'Oh, this is his winter programme,' said his wife, 'that I have been describing. It is in the summer, when he's down at Juvisy, that he continues his studies in astronomy; that is to say, from May to November. There the programme of his daily life is somewhat different, for on fine nights he sometimes stays up at his observatory till a very early hour in the morning. But as here, so at Juvisy, he is very regular in his habits.'

"'You have a good library at Juvisy?' I said, turning to M. Flammarion, who was sitting by at his table, dressed in white flannels. 'Ten thousand volumes, at least,' he answered. Then rising, he added: 'Let me show you a wonderful "Cicero" which I have here.' He passed me the volume and said: 'It was here that I took the story of the youths of Megara and of their vision, which I described in "Uranie."' Referring to 'Uranie' he added: 'I shall write no more novels. If I wrote that one, it was because my desire and ambition are to impart scientific knowledge by every means in my power. The novel is a medium in some sort. Personally I hate novels, and never read any. As to my future literary labors, my time will almost entirely be taken up, for another eight years at least, with my "Astronomical Encyclopædia," of which I am editor, and which is to be a popular handbook to all the branches of the science. Now and then, no doubt, I shall write newspaper articles, but as few as possible, and only when something of very great interest happens.'

"'And in the way of observation?'

"'I shall continue to study Mars as much as possible, to try and find out what is going on there. Mars interests me above all the planets, because it is the planet which most closely resembles the earth.'

TYCHO BRAHE, THE ASTRONOMER.

SIR ROBERT BALL has a very interesting paper in *Good Words* for April, describing Tycho Brahe, the great Danish astronomer. Tycho went to the university when he was thirteen, and had his attention drawn to astronomy by an eclipse of the sun. He marveled that it could be foretold with such accuracy, and devoured a copy of Ptolemy's book; it is still preserved with his comments in schoolboy hand. From that moment he was devoted to the study of the stars. His uncle deplored this waste of time and talents, and employed a tutor to try and divert Tycho's attention to more profitable subjects. Tycho, however, triumphed over his tutor and guardian, and succeeded in making for himself such fame that the King of Denmark decided that for the credit of the country the famous astronomer must not be allowed to go elsewhere. He sent for Tycho, and ascertained "that what he wanted was the means to pursue his studies unmolested, whereupon the king offered him the Island of Hven, in the Sound near Elsinor. There he would enjoy all the seclusion that he could desire.

The king further promised that he would provide the funds necessary for building a house and for founding the greatest observatory that had ever yet been reared for the study of the heavens. After due deliberation and consultation with his friends, Tycho accepted the king's offer. He was forthwith granted a pension, and a deed was drawn up formally assigning the Island of Hven to his use all the days of his life. The foundation of the famous castle of Uraniborg was laid on August 30, 1576. The ceremony was a formal and imposing one, in accordance with Tycho's ideas of splendor." It is rather sad to learn that a new king arose who knew not Tycho in his old age, and that royalty and science parted company. The sketch is illustrated with photographs of his astronomical instruments and views and plans of the Castle of Uraniborg.

UNIVERSITY STATISTICS.

SOME interesting statistics regarding the comparative number of universities in the different countries of Europe are given in an article in the *Nuova Antologia* (March 15). Here are the main results in tabulated form :

Country.	Universities.	Population for each university.
England	7	4,143,002
Austria-Hungary	11	3,759,888
France.....	15	2,556,138
Germany.	20	2,471,423
Italy.	21	1,436,114
Spain.....	10	1,756,563

Thus it can be seen at a glance that of all the Western Powers England possesses the smallest number of universities in proportion to her population, the figures quoted being only attained by including Victoria, Nottingham and the Welsh University within the number. Italy, on the other hand, can boast of the largest number of universities in proportion to her population. The author, Signor Martini, is, however, very far from taking credit for the fact ; on the contrary, he gives a most depressing account of the actual condition of the Italian centres of learning. "There is no doubt of the fact," he writes, "the universities are too numerous. Everywhere there is a deficiency of scientific appliances and poverty of endowment. The grants received are insufficient, but neither the State nor the local authorities are at present in a condition to bear an increased burden." The possible remedies for the existing condition of things appear to be three in number—*i. e.*, restrictions in the right of conferring degrees, greater autonomy in the management of each university and the suppression of a certain number. The author condemns the first two proposals and reserves the third for treatment in a future article.

MAX KLINGER, the artist, poet and musician, has just completed his "Brahms-Fantasien," a series of sketches to accompany and to illustrate Brahms's songs. They are described by A. G. Meyer in the *Magazin für Litteratur*.

BEHIND THE BARS OF A MENAGERIE.

MR. CLEVELAND MOFFETT makes a fascinating tale, in *McClure's Magazine*, of his experiences among the *lares* and *penates* of one of the great menageries. Mr. Moffett has been so enterprising as to go to live in the inner circle of this strange profession of animal taming.

"The best part of a wild beast show," he says, "is never seen by the public, for the most thrilling and dangerous feats are done outside the ring. For many weeks I made diligent use of a special privilege to go and come at will, by day or by night, among the cages of the great Hagenbeck show, and study the animals in all their moods. One day I watched two beautiful leopards hurl themselves like spotted balls from side to side and end to end of the cage, and from floor to ceiling, making bounds of ten or twelve feet in the air—for leopards are the strongest jumpers of all known beasts. As they leaped gracefully, lightly, they kept up a deep roaring, almost equal to a lion's. They were not angry—they were merely playing. But when two leopards play in a cage big enough for their prodigious agility, it is a great sight. One day I saw Charlie, a Bengal tiger, bend an iron bar as thick as my thumb with one stroke of his forearm. Another day I had a sight worth a long day's journey, when the coquettish lioness Mignon flirted with the lion Pollux, and the jealous Prince, with roars of defiance, sprung upon his favored rival, and fought him with fang and claw. None of this was on the programme."

THE "INGLORIOUS MILTONS" OF THE MENAGERIE.

"Besides the regular tamers, whom the public know from having seen them at their work, there are some obscurer heroes in a wild beast show, namely, the grooms. These are the men who *live* among the wild beasts ; who go into their cages every day, and sleep within a few feet of the iron bars in order to be ready for any emergency. They chain and unchain the animals, give them meat and drink, take away the bones from under their hungry jaws, separate them when their blood is up and they are fighting to kill, and treat and attend them when sick or wounded. They come to be to the wild beasts a sort of personal companion, now rolling about with them in play upon the straw, now driving them off with word or blow when a murderous mood takes them. When in the public ring a tamer is bitten by a lion, they run in and fight back the foe whom his own master can no longer control. They assist the professional tamers in breaking in new or unruly animals, and they are ready at a moment's notice to do what the professional tamers never do, that is, to enter the cages of the wild beasts in the darkness of night. The famous tamer Philadelphia, for instance, who is certainly not lacking in courage, told me that he would not take such a risk for the whole of New York City."

MAN VS. BEAST.

Of the professional tamers themselves Mr. Moffett has a deal of interesting talk. He made friends with

one, a man named Philadelphia, and reports the interviews he furnished.

Speaking of a hairbreadth escape he had with an unruly pupil, Philadelphia said :

"No, it would have been useless for me to use a revolver, even if I had had one. I could never have drawn it from my pocket in time, and probably it would not have prevented the lion from killing me even if I had shot him. The heavy jaws have only to close once on a man to leave little life in him. Lion tamers never carry revolvers, partly because they would be of little use and because of the danger to the spectators.

"As to wearing a suit of mail under the clothing, I have known novices at lion taming to do so, but I consider it a useless precaution. In the first place, no suit of mail was ever made strong enough to prevent the teeth of a tiger or a lion from going through it. And, in the second place, even if the links were strong enough to resist the teeth, the pressure of the jaws alone would crush a man to death. The whole secret of the thing lies in inspiring the beasts with such awe of you that they'll never dare to attack you. If they should attack you they could kill you easily ; but they must be rendered so fearful of your presence and your power that they will not venture any attack. Of course, they will scratch you many times ; that is unavoidable. But when they start out to kill they usually do kill. Why shouldn't they ? Think of their vast strength against a pigmy man like me !"

"But how do you inspire a lion with this wholesome dread ?" Mr. Moffett asked.

A LESSON IN LION-TAMING.

"It depends entirely upon beginning very young with them, and exercising boundless patience in accomplishing your purpose. Let me tell you how I had to train this lion, Black Prince. He was caught in the jungles of Africa nearly four years ago, and landed in Liverpool a savage cub, much more savage by nature than the ordinary lion at the age of ten months. Then I took him and began the task of taming him. He was in a small cage, and I talked to him and stood in front of the bars for several days, feeding him bits of meat ; for, as is usually the case, he had ceased drinking milk since he was six months old. After he had got to know me a little I went into the cage, carrying a wooden club in each hand. The first time I entered he sprung at my throat, as his fierce instinct taught him to do. I gave him two or three good raps over the head and flanks, and he went back, not roaring, but making the queer-sounding purr peculiar to young lions. Then he came at me again and again. I used my clubs, but not too hard, avoiding hurting him badly, and being careful not to strike him on the back, for a young lion's back is easily broken. After feeling the club several times he kept away from me, and went into a corner of the cage sulking. I sat down on a box and looked at him. I sat there an hour, two hours, three hours. Now and then he moved a

little and purred savagely. Once he sprung at me again, and got the club as before. At the end of the three hours I threw him some meat and left the cage."

A MOST PRAISEWORTHY CUCKOO.

THE cuckoo has never been in good standing among birds on account of a constitutional disinclination to build a nest of its own. There is a member of the cuckoo family, however, whose good deeds go far toward making up for the shortcomings of its relations. The virtues of this respectable little cuckoo are set forth in the *Overland Monthly* under the title "El Paisano, Enemy of the Rattlesnake."

The writer, Mr. Thomas N. Moyle, says : "This bird is called scientifically the *Geococcyx Californianus*, but is popularly known under several other names in Southern California, which are about equally divided between English and Spanish *sobriquets*—such as the 'road-runner,' from the habit of tripping along a trail in the mountains just ahead of travelers ; *el paisano* from *pais* (country) ; 'chaparral cock,' from his living in chaparral thickets, and again in Spanish, *churrea*, from the cry he utters, which is a deep bass or muffled tone that renders indistinct the direction or distance whence it comes.

ENEMY OF THE RATTLESNAKE.

"While the paisano is able and willing to kill a rattlesnake in fair, open combat, it has a much more poetical plan. Should it chance to discover a snake asleep in the vicinity of a growth of that small cactus or prickly pear which General Frémont found so formidable a barrier in Southern California, it will quietly and vigorously commence to build *chevaux-de-frise* of it about the unconscious reptile. The stems of the cactus are extremely fragile at the joints. The bird usually selects the early morning for its operations, as the snake sleeps torpidly at this hour, especially along the coast, where he is benumbed by the chill at night. When the rattlesnake is literally 'corraled' by the bristling inclosure, the paisano suddenly arouses him by a sharp stroke of its bill, or takes a joint of the cactus in his beak, poises in the air a few feet above the sleeping victim, and drops it full upon him. To coil for a spring is the reptile's first movement, and thus its body is brought into violent contact with the sharp points of the palisade. To retreat is the next aim. It strives in vain to find a passage. Teased by the bird, which continues industriously to drop missiles or to apply at every opportunity its sharp beak over the inclosure from the outside, doubly enraged at the barrier that opposes his escape, the snake savagely strikes at the cactus wall. A bloody nose and a mouthful of spines are no more welcome to a rattlesnake than to any other creature. He becomes more and more enraged. Again and again he madly strikes. Blinded at last by fury, he turns upon himself, and plunges his fangs into his own flesh, and at last dies, his own executioner."

THE PERIODICALS REVIEWED.

THE NORTH AMERICAN REVIEW.

SURGEON-GENERAL STERNBERG'S plea for a National Health Bureau has been reviewed elsewhere in this magazine.

Sir Charles W. Dilke, in an article on Lord Rosebery's Administration, makes this interesting prediction: "Such a Liberal-democratic policy will probably not last. Other influences may in the long run assert themselves. Questions of foreign affairs may spring up. War itself may come upon the Empire. But if democratic influences prevail for the moment with the present cabinet the election of 1895 may give the Liberal party as at present constituted its last triumph, before it has in turn to give way to the rapidly changing conditions of society in this interesting and, as compared with conservative America, very advanced old country."

The present hostility to Roman Catholics manifested in some parts of the country is debated by George Parsons Lathrop and Bishop Doane, the former writer having the point of view of a Catholic of purely "native American" lineage, and the latter that of a pronounced American Episcopalian.

Karl Blind thus concludes an article on "Anarchism and the Napoleonic Revival" in France: "In many ways, the situation of to-day reminds us of a similar one in 1848, with this difference only: That the incipient germs of the anarchistic doctrine which already then threatened the Democratic cause have developed since into full bloom. The utmost watchfulness is, therefore, commendable to all sincere and sensible lovers of progress, lest the Republic should once more suffer harm for many years to come."

THE FORUM.

EDWARD ATKINSON'S "Meaning of Farm-Mortgage Statistics," and President Thwing's review of President Eliot's quarter-century of service, receive notice in our department of "Leading Articles of the Month."

Dr. Stanton Coit and Mr. David MacGregor Means discuss the pros and cons of State aid to the unemployed.

President G. Stanley Hall publishes the second in his series of articles on universities and the training of professors. Men grow up in these days, he says, ignorant of nature and her ways: "Some years ago by careful individual study, I found that 60 per cent. of the six-year-old children entering Boston schools had never seen a robin, 18 per cent. had never seen a cow, some thinking it as big as their thumb or the picture, thus making mere verbal cram of all instruction about milk, cheese, butter, leather, etc. Over 60 per cent. had never seen growing corn, blackberries or potatoes; 71 per cent. did not know beans—even in Boston; and in 109 other topics primers generally presuppose the percentage of ignorance of nature was such as to give pathos to the idea of some, that good people, when they die, go into the country."

Another pedagogical article in this number is by Mary E. Laing on "Child-Study: a Teacher's Record of her Pupils." It is an interesting statement of experience in attempting to make a scientific record of child-observation in Brooklyn, N. Y., and in Platteville, Wis.

Price Collier, in contrasting English with American home life, calls attention to the fact that the "proportion of Americans who could have a modest home, but who prefer the flat and stale unprofitableness of hotels and boarding houses, is, as compared with English people of the same income, vastly greater."

Mrs. Elizabeth Stuart Phelps Ward, more than twenty-five years after the publication of "The Gates Ajar," tells how her numerous letters from unknown readers of that popular book have helped to an answer of the question, "Is Faith in a Future Life Declining?"

THE AMERICAN JOURNAL OF POLITICS.

MR. CARL SNYDER sums up as follows an article in the current number of the *American Journal of Politics* on the "First Year of the Administration:—" "It is a fact largely lost sight of that the occasions have never before been presented which would afford an adequate and definite test of Mr. Cleveland's statesmanship and actual capacity for the presidential office. His first term was singularly devoid of high emergencies, and on its smooth currents he found comparatively easy navigation; the mistakes he made were of slight consequence, because the occasions were not momentous."

"On the other hand, no year since the war has presented so many critical moments, demanding the highest and clearest judgment, the presence of a genuine statesman, as has the past year. That Mr. Cleveland has gone from blunder to blunder, from mistake to mistake, with the most unfaltering confidence, and to the most unfortunate results—indeed, well-nigh to the wreck and ruin of the country, does not occasion astonishment to those who have carefully judged his calibre and recognized his mental limitations. Otherwise, his unexampled failures would excite astonishment, contempt, disgust. It would have been vastly better for the President's fame had he never been elevated to the chief magistracy for a second time."

Mr. A. J. Warner considers the subject of Bimetallism from the point of view of national interests. He sets forth many strong reasons why such a country as ours should have a money standard that would not vary with the varying conditions of other countries, and urges the 70,000,000 of people of the United States to act for themselves regardless of whether other countries join with them or not.

THE ARENA.

THE ninth volume of this review closes with the May number. The opening article of this number is by the Rev. M. J. Savage, on "The Religion of Lowell's Poems."

Stinson Jarvis concludes his psychological studies entitled "The Ascent of Life." Dr. James R. Cocke contributes an interesting paper on "The Power of the Mind as a Remedial Agent in the Cure of Disease."

Louis F. Post, the well-known advocate of the single tax, writes on "First Principles of the Land Question."

A prominent feature of the number is the symposium on "How to Deal with the Liquor Traffic."

THE NINETEENTH CENTURY.

THE *Nineteenth Century* contains many articles of average interest, but none calling for very special mention.

NILE RESERVOIRS AND PHILÆ.

Sir Benjamin Baker sets forth the case in favor of the engineers who are proposing to make a reservoir of the Nile, which will necessitate interference with the temples at Philæ. He says: "It has been proved beyond dispute that the establishment of a reservoir in the valley of the Nile is a pressing necessity which will result in incalculable benefit to the country at large, and that at Philæ alone are found the conditions necessary for the building of an absolutely safe and reasonably cheap dam. The dam, therefore, must be built at Philæ, and with the least possible delay, or in the event of the occurrence of one or two 'bad Niles,' and the loss of several million pounds' worth of summer crops, Great Britain will be morally responsible for the loss and individual suffering." By the proposed scheme, the Nile round the Island of Philæ would be converted into a great lake, and the temples would be raised, Chicago fashion, solidly into the air, some forty feet. Owing to the solidity of their construction, the absence of windows, and the solid rock foundation, it would be possible to elevate them with comparatively little difficulty.

MR. GLADSTONE AND HORACE'S LOVE ODES.

The first place in the number is devoted to Mr. Gladstone's metrical version of the five love odes of Horace. They are interesting as exhibitions of intellectual agility on the part of England's ex-Prime Minister. We give the fifth stanza in the ode to Lyce:

Spare me, though cruel as the Moorish snake,
And hard as oaks to break.
For flesh and blood will bear no more the strain,
Nor soak in floods of rain.

THE CZAR AND HIS SUBJECTS.

There is a very pleasantly written paper, entitled "Life in a Russian Village," by J. D. Rees. He says: "The Russian communal system has many most admirable features, and the government wisely preserves the simple self-governing commune, an organization radical in its type, yet the strongest supporter of autocracy. An agitator would have short shrift among these loyal peasants, who possess, almost to a man, that feeling of strong personal attachment to the monarchy and to the royal family which is also present in England, and which Her Majesty in her latest message to her people declared to be 'the real strength of the Empire.' Last year, during the famine, the Czar decided to have but two Court balls in St. Petersburg, and he set aside for the suffering a portion of a fund accumulated for unborn princes of the royal family. Society, as a matter of course, followed the sovereign's example. It was soon considered improper to spend money in entertainments while the people were suffering, and what was saved was given to the poor. These facts were made known throughout the length and breadth of the Empire, and very naturally added to the affection with which the people habitually regard the occupant of the throne, particularly one who, like his present Imperial Majesty, is a Russian of the Russians. Fragments of a handkerchief of the Empress, torn to pieces by a loyal crowd, are treasured as if they were mementos of a martyred Stuart or a Marie Antoinette."

RECENT ARCHEOLOGY.

Professor Mahaffy describes recent discoveries of Archaeology in Egypt and Greece. He hurls his anathema against the proposal to construct the irrigation reservoir that will interfere with the temples at Philæ, and then after surveying the recent discoveries of the archæologists in Greece, suggests that the British Hellenic Society has made a mistake in settling at Athens. It had better take up its quarters at Alexandria, or better still, establish its school in a steam yacht which could move from place to place wherever excavations were being carried out.

THE NEW REVIEW.

IN the *New Review* next month there is going to be published a series of articles upon the results of municipalization, Mr. Chamberlain leading off. The current number of the *New Review* contains several articles of interest.

MR. HENNIKER HEATON'S NEW CRUSADE.

Mr. Henniker Heaton has apparently abandoned for the time being the attempt to improve the ways of the Post-Office in carrying letters to the British colonies, and is now turning his attention to the telephone monopoly. He says: We have two evils to contend with, the rapacity of the Treasury and the torpor of the Post Office. We want some new body, strong enough both to resist the Treasury and to stimulate the officials. Such a body is to be found in the consultative committee which I have long called for. This committee, composed of independent members of Parliament and leading men of business, under the presidency of the Postmaster-General, would consider all questions relating to the service, and record their opinion, which should be laid before Parliament. Being in touch with the commercial and social world, their views would represent public opinion on any suggested change or reform. If a small company could provide a good service for \$25, it is quite certain that the Post Office, with the power of opening the streets and crossing private property, could do as much for \$15, or even less. To sum up. It is clear that the fundamental evil is the vicious system of licensing maintained by the Post Office.

TREES IN LONDON.

Sir Herbert Maxwell, in an illustrated paper, discourses upon the condition of the trees which still linger in the streets of London and sums up the result of his investigation as follows: "The state of London plantations is very much better than might have been the case considering the somewhat unkindly soil, the stringent drainage, intense heat, and impure atmosphere which have to be encountered, but there is much room and necessity for improvement in the choice of species and their cultivation when chosen. Year by year the town is eating outward into the country and no care is taken—it is nobody's business to take care—that trees should not be needlessly felled."

THE TRUTH ABOUT THE LONDON BAKERIES.

The editor of the *Bakers' Times* replies to the report of Dr. Waldo as to the state of some of the cellar bakeries in London. He stoutly asserts that "the noise that has been made over the discovery of half a dozen dirty bakeries is out of all proportion to its importance, and there is little doubt that the investigations which the Home Secretary is making into the state of the London bake-

houses will demonstrate that there is no need for further legislation, and that the baker is not by any means so black as he has been painted."

OTHER ARTICLES.

Mrs. Edmund Gosse contributes a little sarcastic article concerning the tyranny of women. The article on "The Two Babylons, London and Chicago," contrasts the life of the capital of the West and that of the East.

THE CONTEMPORARY REVIEW.

THE *Contemporary* this month is the best of the English monthlies. We notice elsewhere M. Jules Simon's Plea for Disarmament, Mr. Walter Besant on the jubilee of the Ragged School Union, and Mr. E. B. Lanin's glowing description of the improvement which has been wrought by the Austrian Government in Bosnia and Herzegovina.

MR. "SPECTATOR" HUTTON ON MR. GLADSTONE.

Mr. R. H. Hutton of the *Spectator* contributes a critical estimate of Mr. Gladstone. It is somewhat in his old style, although it is dashed by the gloom which is so unhappy a characteristic of the once genial optimist of the *Spectator*. Mr. Hutton thus sums up what he regards as one of the leading characteristics of Mr. Gladstone: "I think it may be said, therefore, that Mr. Gladstone's greatest success and greatest failure have both been experienced in preaching and practicing the virtue of national altruism, which at first he took up with something like moderation and judgment, but ultimately pursued with a heat and indiscriminate zeal which has brought disaster on his Government and bitter disappointment to himself. He has exhibited in this field both the grandeur and extravagance of a noble ideal—a noble ideal, in the latest instance, hastily, and I may say almost rudely and fanatically, insisted on to the exclusion of all reasonable and statesmanlike considerations. He has undoubtedly set a stamp of disinterestedness on the policy of the United Kingdom which has borne fruit, I think, in some of the other countries of Europe. But he has gone far toward making that policy odious in the eyes of prudent politicians, thrusting it forward most injudiciously and provocatively in a case in which both honor and duty, no less than policy, barred the way."

THE ETHICS OF DYNAMITE.

Mr. Auberon Herbert writes a characteristic article on "The Ethics of Dynamite." He uses dynamite to point his favorite moral that all government is accursed and that a majority which taxes is, on principle, only a little better than the dynamiter who kills. He describes the tyranny of European government as follows: "Almost every European government is a legalized manufactory of dynamiters. Vexation piled upon vexation, restriction upon restriction, burden upon burden, the dynamiter is slowly hammered out everywhere on the official anvil. The more patient submit, but the stronger and more rebellious characters are maddened, and any weapon is considered right as the weapon of the weaker against the stronger."

"In one way and only one way can the dynamiter be permanently disarmed—by abandoning in almost all directions our force machinery, and accustoming the people to believe in the blessed weapons of reason, persuasion and voluntary service. We have morally made the dynamiter; we must now morally unmake him."

THE NATIONAL REVIEW.

MR. CHAMBERLAIN contributes the only surprise which the current number of the *National Review* contains, in the shape of a rather dull history of the Home Rule campaign. Sir Herbert Maxwell defends his heresies on the subject of salmon fishing from the strictures of Mr. Earl Hodgson. Sir Herbert Maxwell, it may be observed, thinks that the sense of hearing is very well developed in fish. Mr. Sidney J. Low endeavors to make interesting to the readers of to-day the story of the revolutionary struggles of Kossuth. Mrs. Ross describes a stroll in Boccaccio's country. Mr. Theodore Beck discourses in the usual Anglo-Indian fashion upon the perils that threaten to overwhelm India if the House of Commons will persist in imagining that it knows anything at all about Indian affairs. Mr. Arnold Foster shows up the inaccuracy of the British Admiralty in the House of Commons. The Hon. R. H. Lyttelton discourses upon Eton cricket. Felicitas enters into minute detail of how he lives in comfort with a wife and small family in West Kensington on \$1500 a year. There is a short poem by Violet Fane and a review of Lord Wolseley's "Marlborough."

FORTNIGHTLY REVIEW.

THE *Fortnightly Review* has some good articles. Karl Pearson on "Woman and Labor," is noticed elsewhere.

THE GHOST ORIGIN OF CULTIVATION.

Mr. Grant Allen has an interesting article upon the "Origin of Cultivation," the theory of which is that the primitive savage first learned to cultivate the ground on account of his theory that crops were made to grow by the ghost of a dead man: "Originally, men noticed that food-plants grew abundantly from the labored and well-manured soil of graves. They observed that this richness sprang from a coincidence of three factors—digging, a sacred dead body and seeds of food-stuffs. In time, they noted that if you dug wide enough and scattered seed far enough, a single corpse was capable of fertilizing a considerable area. The grave grew into the field or garden. But they still thought it necessary to bury some one in the field." Hence early agriculture and seed growing was associated with the shedding of blood. It was held to be necessary, so to speak, to manure with a fresh ghost, for the potency of the spirit died out after a time. The theory is ingenious, and is supported by a multitude of statements chiefly quoted from Mr. Fraser's "Golden Bough."

THE QUARTERLY REVIEW.

We notice elsewhere the articles upon "Shakespeare's Birds and Beasts," "Old Testament Criticism," and "The Liberals and South Africa."

THE NAVY AND ITS REQUIREMENTS.

The first place is given to an article on "The British Navy," the writer of which agrees with the editor of the *Edinburgh Review* in considering the British naval programme altogether inadequate: "It is, we think, conclusively proved that in order to raise the *personnel* of the navy to the strength required to man the war fleet rapidly in an emergency, both in the present year and in the near future, it is imperative to make large additions in the numbers both of our active-service men and re-

serves. It is our strong conviction that the following increase, at the least, should be made during the next two years: In active-service men a increase is needed of 6,500, of whom 3,500 should be engine-room artificers and stokers. The remaining 3,000 should be obtained by increasing to this extent that most valuable corps, the Royal Marines."

OCEAN MEADOWS.

The scientific article upon "Ocean Meadows" is interesting, inasmuch as it calls attention to the fact that the real vegetation of the ocean which is the counterpart to the grass which covers the earth is not the seaweed which covers the rocks or at the bottom of the sea, but a minute floating weed. The writer says: "The balance has been adjusted by the discovery of a ubiquitous marine vegetation, causing the tropical seas to glow with phosphorescent beams, and discoloring polar ice where the sea breaks on it. The existence of these meadows of plants is made plain to us by the direct evidence of tow-netting the upper layers of water with fine silk nets, when their capture, together with the minute forms of animal life that live upon them, is effected."

THE CENTURY.

IN the department of Leading Articles we have reviewed Mr. W. A. Coffin's article on the artist Lagnan-Bouveret. The "starred" feature of the *May Century* is the first of a series of articles by two most enterprising young Americans who rode eastward across Asia on their bicycles. This journey of 7,000 miles from the Bosphorus to the Pacific, through oriental lands practically unknown to Caucasians, is surely the most daring bicycling feat yet attempted, and has in addition a value of its own in furnishing material for a most entertaining and novel series of "travel sketch" papers. Fancy doing Western China on a "byke!" A paragraph taken from the part which tells of the journey through the Turks, who must certainly have been "unspeakable" at the apportionment, is typical of their log.

Mr. Brander Matthews, though he confesses to knowing little about books except as to their "insides," gives a very pleasant talk on "Bookbindings of the Past," and of the cunning old handicraftsmen and artists—Grolier, the Aldus family, Le Gascon, Éve, Derome and Padeloup. "The art of bookbinding was cradled in France, even if it was born elsewhere, and in France it grew to maturity. Italy shared the struggle with France in the beginning, but soon fell behind exhausted. Germany invented the book-plate to paste inside a volume, in default of the skill so to adorn the volume externally that no man should doubt its ownership. England has had but one binder—Roger Payne—that even the insular enthusiasm of his compatriots would dare to set beside the galaxy of bibliopegic stars of France. The supremacy of the French in the history of this art is shown in the catalogues of every great book sale and of every great library; the gems of the collection are sure to be the work of one or another of the Frenchmen to whose unrivaled attainments I have once more called attention in these pages. It is revealed yet again by a comparison of the illustrations in the many historical accounts of the art, French and German, British and American; nearly nine-tenths of the bindings chosen for reproduction are French. And, after enjoying these, we are often led to wonder why a misplaced patriotism was blind enough to expose the other tenth to a damaging comparison. These remarks, of course, apply only to the binders whose work was done before the beginning of the nineteenth century. Of late years the superiority of

French binders has been indisputable, but it has not been overwhelming. There are at present in Great Britain and in the United States binders whom no one has a right to pass over in silence, and about whom I hope to be allowed to gossip again in these pages; but in the past it was France first and the rest nowhere."

SCRIBNER'S.

IN another department we have quoted from F. J. Stimson's article on "The Ethics of Democracy," Mrs. Clara S. Davidge's on "Working Girls' Clubs," and Aline Gorren on "Womanliness as a Profession."

A series of magnificent illustrations by the author add to the attractions of the opening paper—"Some Episodes of Mountaineering," by Edwin Lord Weeks. He advises strongly against mountain climbing without guides.

"It has been a fashion, particularly of late years, for experienced Alpinists to make difficult or little-known ascents unattended by guides, and while experience and self-confidence may be better acquired in this way, they are often dearly bought. Accidents have happened to the most famous experts while prospecting alone, and it will be found that by far the greater number of Alpine catastrophes have been due to carelessness, and to the rashness of novices in venturing too far without guides. Unless one is extremely quick and clever, he is very likely, when he finds himself in a perplexing situation, to under-estimate the difficulty of certain passages, where danger is not apparent, but which a guide would never attempt: such, for instance, are the steep and sunburned grass slopes high on a mountain-side, which often terminate in cliffs or vertical ledges above a glacier: as the tufts of dry grass usually point downward, they afford little hold to the nails in one's boots, and are often as slippery as glass. There are also certain places which look appalling to a beginner, but which turn out to be perfectly easy when once the guide in front has got safely over them. Most treacherous of all to the solitary climber are the steep 'glissades' down *coulloirs* of snow or ice."

HARPER'S.

MR. JUNIUS HENRI BROWNE continues his studies of domestic, or rather personal, finance in a paper in which he discusses "Pecuniary Independence."

It depends where you are and how many there are of you, of course.

"It seems to be generally agreed that in New York a native citizen, a man of small family—a wife and two children, for example—cannot get on respectably with less than about \$5,000 a year. If a bachelor, \$1,200 to \$1,500 will answer. In other cities \$3,000 to \$4,000 may sustain him domestically; in a village or the country, materially less. If he must descend to marked plainness, rigid economy, prosaic facts, he can find places where, without other income, \$2,000 to \$2,500 will keep him and his household together, not without material comfort. That amount, therefore, may be taken as an approximation to an independence, as enough certainly to keep the wolf and the creditor from the door. Confession may be frankly made, however, that no such sum is regarded by city folk as sufficient for the purpose. They might put it at fully \$10,000, and speak of minor figures as penury, or prolonged starvation. Strict independence may, notwithstanding, be computed in general at \$2,000 to \$2,500; and he who has secured it indubitably has no cause to fear compassion, or to seek for sympathy. He may esteem it a genuine misfortune to be so reduced, especially after having had five or ten times as much. Still, it is independence—not handsome, welcome, or in any manner satis-

factory; and it is within reach of nearly any one who diligently and earnestly works for it."

This is an especially strong fiction number, with short stories by Richard Harding Davis, Grace King and others, an installment of George Du Maurier's "Trilby," which is "taking" very well indeed, and particularly the first half of a most charming novelette by James Lane Allen, which he calls "A Kentucky Cardinal." Mr. Howells is one whose autobiographical tendencies are invariably delightful, and there are various evident reasons why his "First Visit to New England," which he begins to tell about in this number, should be more than usually full of interest for his public.

THE COSMOPOLITAN.

THE May *Cosmopolitan* has in one of its departments an interesting paragraph by Professor A. E. Dolbear on the "Electric Utilization of Niagara." Our readers probably know that a company has put into operation a plant to snatch from the great falls a small moiety of its 1,000,000 horse-power. "Manufacturing establishments in the immediate vicinity will probably have wires connected directly to the dynamos, but factories at a distance of ten or more miles will have the voltage raised by transformers to ten thousand volts or more, and again transformed to lower voltage where the power is to be utilized. This process is to save in cost of conductors, for a given amount of electrical energy of high voltage requires a smaller wire than if the voltage is low. A number ten copper wire, which is about an eighth of an inch in diameter, which will conduct, say, thirty horse-power at one thousand volts, will conduct a hundred horse-power at four thousand volts. It is expected that most of this power will be used for motor work rather than in lighting, and Niagara companies have been organized in several cities and towns about, some of them at the distance of a hundred miles or more, with the probability that ultimately some of the energy may reach even New York City. It seems likely that the region about Niagara will soon become a great industrial centre, where all sorts of mechanical enterprises will be grouped, because power can be had cheaper than elsewhere. There are many questions concerning the economical distribution of electrical energy that will be settled by this Niagara plant, and engineers are watching the developments with great interest. After these are settled, by experience, water-power in places now inaccessible for manufacturing purposes will suddenly become valuable properties for electrical power stations. No one need feel apprehensive that Niagara Falls will be seriously affected by this seemingly large draft upon its water supply. In reality it represents but about one-fortieth of the bulk of the water of the river, and several such power-plants might be established there without diminishing the flow appreciably."

Mr. Howells' Altrurian talks this month about house-keeping as she is kept under the "plutocratic" system that the said Altrurian finds so absurd. A brave chance for the American woman, with whom the novelist is popularly supposed to be at loggerheads, to get back at him!

We have quoted in another department from the articles on General Grant, from "Wild Beasts and their Keepers," by Cleveland Moffett, and from "Flammarion, the Astronomer," by R. H. Sherard. This being a "Grant Number," the field of the magazine's contents is entirely covered by the selections in our leading articles, with the exception of the fiction by Bret Harte, Stevenson and Mary T. Earle.

THE ATLANTIC MONTHLY.

IN the May *Atlantic* both Justin Winsor and John Fiske write on Francis Parkman. Professor Fiske concludes his more critical paper with this estimate of the historian: "Thus great in his natural powers and great in the use he made of them, Parkman was no less great in his occasion and in his theme. Of all American historians he is the most deeply and peculiarly American, yet he is at the same time the broadest and most cosmopolitan. The book which depicts at once the social life of the stone age and the victory of the English political ideal over the ideal which France inherited from imperial Rome is a book for all mankind and for all time. The more adequately men's historic perspective gets adjusted, the greater will it seem. Strong in its individuality and like to nothing beside, it clearly belongs, I think, among the world's few masterpieces of the highest rank, along with the works of Herodotus, Thucydides and Gibbon."

William F. Slocum, Jr., writes on "The Ethical Problem of the Public Schools," and lays the greatest stress on the elementally serious importance of the proper teaching of right and wrong in the public schools. He points out the many flagrant ethical dangers to which the life at the schools is heir, and singles out especially the evil of "the pauperizing tendency" of free tuition, free textbooks and free everything. "The public school is a normal outgrowth of our social and political order, and its tendencies are the logical outcome of this order. Its dangers are those that exist in this democratic state, but it lies in the power of the schools to eradicate much of the evil in the state. It is difficult to say how this is to be accomplished, but certainly the most effective method will be along the line of the general improvement of the system."

"This improvement will be brought about by the divorce of the control of the schools from partisan politics; by the appointment of teachers for merit only, merit in which force of character should be regarded as a *sine qua non*; by the introduction of scientific instruction to the exclusion of mechanical methods; and by constantly making prominent the idea that the pupils are being fitted for citizenship and actual service. Something could also be said in regard to the necessity of a larger number of teachers, in order that the element of personal influence may be greater and more immediate."

LIPPINCOTT'S MAGAZINE.

"A BREAD-WINNER" makes some good suggestions to other bread-winners: "I am sure I only echo the thoughts of hundreds of employers when I ask, 'Where, in the vast army of the unemployed, of which we hear so much, is the man or woman who will fill the positions I have to offer?' Echo answers, and always will answer, 'Where?' until more persons learn to lay aside vague yearnings for imaginary honors and accept faithfully the limitations and responsibilities of every-day business life. Its rewards may not be so tempting as the glittering bubble of fame, but they are a good deal more substantial, and, what is more to the point, more likely to be reached."

Francis B. Loomis, in an article on "Americans Abroad," affirms that living may be found less expensive in Europe than in America, if persons have a turn for economy, but those who wish to enjoy "all the comforts of home" will find it somewhat dearer.

THE FRENCH REVIEWS.

THE REVUE DES DEUX MONDES.

THE *Revue des Deux Mondes* of April 1 opens with the third part of "Roman Africa," by M. Gaston Bossier, of the French Academy.

HOUSE RENT IN OLD PARIS.

This is followed by an extremely interesting paper on "House Rent in Paris from the Thirteenth Century Downward." It is written from documentary evidence, and brings the town as it was at various epochs vividly before the eyes of the reader. We are made to see the new streets crawling up the lanes and across the fields. Land in old Paris was frequently sold for so many centimes the French yard; indeed, in 1303, a yard of the capital between the Chatelet and the Tuileries only cost one centime, and in what is now the Faubourg St. Honoré land was much cheaper; in 1370, land in the Faubourg Montmartre could be got for four centimes the square yard.

TALMA.

A very lively article on "The French Comedians During the Revolution and the Empire" is by M. V. du Bled. He tells us much of Julie Talma, the wife who was divorced by the great actor, from incompatibility of temper. Madame Talma writes to her friend Louise Fusi, and describes the fashion in which the divorces of that day were obtained. Firstly came the visit to the "municipality," when the husband, accompanying the wife in the same carriage, offered her his hand to assist her to descend, after they had each signed the contract of divorce. Talma accompanied her back to the carriage, and the poor woman said, "I hope you will not entirely deprive me of your presence—that would be too cruel; you will come back and see me sometimes, will you not?" "Certainly," he replied, with an air of embarrassment, "and always with much pleasure."

M. TAINE'S NAPOLEON.

Taine's last unfinished work is finely analyzed by the Vicomte Melchior de Vogüé. Its plan, we learn, involved a study of the Church, of the school and of the family as they have been regulated by the Napoleonic system. The first two chapters were alone finished. Having done so much to destroy the legend of the Revolution, Taine set himself to work to destroy that of the First Empire. He did not live to see the recent revival of Napoleon in literature.

THE REIGN OF WEALTH.

The second number of the *Revue des Deux Mondes* contains several excellent articles. M. Leroy Beaulieu continuing his curious analysis of the reign of wealth, attempts to explain the connection between Mammon and democracy. "Of all the aristocracies past or present," he declares, "the aristocracy of wealth, though doubtless open to all and in some ways most legitimate, is that which excites the most envy and inspires the least respect. Yet is not this often the fault of those who belong to it? Can they always be said to be of the nobility of worth? Can any one dare affirm that money belongs of right to the worthiest? Nay, Mammon is a king whose favors are often obtained in so shocking a fashion that we cannot expect his favorites to be always well thought of." M. Leroy Beaulieu, who writes from an intensely conservative point of view, quotes the United States, observing significantly that in a land to which the

Pilgrim Fathers fled in order to escape the corruptions of the old world now reigns the heavy coarse god of Mammon. "In old days," he continues, "money played no part in French politics. People were fond of talking during the Second Empire of Imperial corruption; what is this corruption to the present Republican austerity? Either we were too severe in the past or we are too indulgent in the present." After dealing with the political world the writer attacks the press, making, however, a silent exception in favor of Great Britain.

IN PRAISE OF SKYSCRAPERS.

A. de Calonne contributes perhaps the most interesting article in the number. Yet it deals simply with the somewhat dry subject of the height of houses in America and England. It is a great mistake to think that "skyscrapers" are of modern invention, even apart from the classic example of the Tower of Babel; Carthage and Tyre both boasted of immense buildings. But even they, admits the writer, would probably look both small and mean by the modern American attempts in the same direction, and the English are beginning to imitate their New York cousins. Although the Englishman professes to be so devoted to quiet home life, declares M. de Calonne, sometimes fifty families will make a common castle in one of the great new residential buildings with which London is being slowly studded.

THE TRAINING OF HORSES.

M. F. Musany has made an exhaustive study of the breaking-in of riding horses from the days of mediæval Europe to the present time. The result of his researches seems to be, on the whole, to the effect that the trainer should always proceed by kindness. The author, who is a well-known authority on the subject, concludes his excellent and clear treatise by asserting that equestrianism is not a science, but an art, and that, therefore, it is impossible to define in each case what course should be pursued, this being especially true of matters relating to the breaking-in and training of young colts.

THE REVUE DE PARIS.

THE *Revue de Paris* makes a strong feature of its fiction, and both April numbers give a prominent place to a story by Anatole France, the author of "Thais," and a well-known critic. In "The Crimson Lily" will be found a brilliant and life-like study of Paul Verlaine thinly disguised under the name of Choulette. Edouard Rod, whose novel, "The Private Life of an Eminent Politician," created considerable attention last year, also contributes a serial dealing with the French manners and morals of to-day.

AN EXPERT'S REVIEW OF THE FRENCH NAVY.

In the April 1 number P. Deschanel, a member of the French Chamber who has been long considered an expert on naval questions, reviews the state of the French Navy in 1894. According to his account the northern coast is practically without any proper defenses, if Dunkirk and Cherbourg are excepted; while on the northwest affairs are in a scarcely better condition. In the south of France, Marseilles and most of the other seaside towns are equally without land defenses, and the whole of the Riviera lies exposed to any enemy who is provided with the resources of modern artillery. Indeed, observes M. Deschanel, an invading fleet need not attempt to come to close quarters;

with the help of their can on they would destroy any of these sunlit cities in an hour.

A LEGEND OF BJÖRNSON.

M. Bignon tells the story of "Björnson and His Life Work," and recalls a legend current in Norway, which tells how one morning the great writer came down as if transfigured, and, calling both his family and servants together, told them that he recognized the error of his ways, and that he would in future take his place among the Freethinkers and Agnostics! Be this story true or false, observes the French critic, it is a fitting allegory of what has befallen the Norwegian nation during the last fifty years, for there, even more than elsewhere, the philosophers have taken the place of the prophets. Björnson, according to M. Bignon, is a seeker after truth, an enthusiast, a sentimentalist: his large heart is full of tragic intensity and love for humanity. Those who wish to know him as he is should read in the original his "Little Verses."

CURIOUS LETTERS FROM "THE MAN OF SEDAN."

The second April number of the *Revue de Paris* contains one of the most curious revelations concerning the private life and real character of the late Napoleon the Third yet given to the world. In these eleven letters, written in the Fortress of Ham, and addressed to a French lady living in Florence, the future Emperor of the French poured out all his soul, and though these strange and somewhat egotistical epistles cannot be called love-letters, they are full of tenderness and vivid affection. "You do not know, you would not be able to understand the effect which your letters have upon me," wrote the Man of Sedan. "How can I describe it to you? I will have recourse to a comparison. You may have seen a fine English picture showing our Lord walking on the water, and with a look reviving the failing courage of one of His Apostles, who seems about to disappear in the deep. . . . Well, your gentle irruption into my solitude has produced on me the same effect. At the sound of your voice I feel my heart grow warmer and the atmosphere of my prison become lighter." Another side of Napoleon the Third's character, which comes out in these letters, is his extreme affection for his father, the ex-King of Holland, Louis Bonaparte. "I would give my birthright," he exclaims, "for one caress from my father." The last letter addressed to his mysterious correspondent is dated March 24, 1847, and is written from London.

Too rarely are we treated to a sight of Madame Alphonse Daudet's name in contemporary French literature. The editors of the *Revue de Paris* are fortunate in having secured for their readers a contribution from her pen, which, taking the form of a number of short detached reflections and recollections, is published under the title of "Alienas."

Gaston Paris, one of the leading authorities on Celtic and Mediæval literature, traces back the legend of Tristram and Isolde—a legend which recurs in the early Irish, Welsh and German writings and which was familiar to French scholars in the twelfth century. Tristram, observes Monsieur Paris, is a name of distinctly Pict origin; Isolde, on the other hand, and that of her father Gormond, King of Dublin, are distinctly Germanic. The Germans have always delighted in the weird story. Wagner built up his opera from a translation made by Gotfried of Strassbourg from the mediæval poem written by Thomas of Brittany.

Apparently equally inspired by the late Wagnerian triumph in Brussels, Catulle Mendès contributes an excellent critical article on Richard Wagner, dealing principally

with those operas which he considers specially fitted for performance before French audiences—namely, "The Meistersingers" and "Tristram and Isolde."

THE NOUVELLE REVUE.

THE *Nouvelle Revue*, though far from neglecting literature and art, is becoming each month more and more political, and Madame Adam, owing to her exceptional position, is able to press into her service as contributors many French and foreign diplomats.

In the April 1st number the first place is given to a lengthy criticism of the one time French Minister of Foreign Affairs, M. Develle, and of him his colleague gives this far from flattering picture: "A speaker destitute of eloquence, an unknown Parliamentarian, dowered with round eyes, china blue in tint, and innocent of eyelashes and eyebrows, a sly expression, a lazy walk, and common vulgar manners, are the characteristics of this skeptical and critical politician." According to his anonymous critic, France owes most of her present troubles to M. Develle, whose strong anti-Russian sentiments are well known.

NEVELSKOY THE EXPLORER.

Madame Vend continues and concludes her account of the great Russian explorer Nevelskoy, and there may be found some charming letters originally written in French by the wife of the brave Admiral to her friends at home. After her marriage the explorer's wife accompanied her husband on all his expeditions, and this is how she performed her journey overland: "I have just seen my saddle, which is quite unlike that generally used by women. Instead of stirrups, the feet rest on a small board, and a high board fixed on to the back makes one feel as if in a kind of arm-chair. . . . I have also a very practical kind of hammock, differing much from those known in Europe, made in thick linen hung on two wooden supports which are fixed on a couple of horses' backs. The effect is that of a kind of cradle, and is far from uncomfortable. My husband has bought me some fine furs with which to cover my feet, and so stretched out in my hammock I shall not suffer from the cold, and shall not only be able to sleep, but even to read during my long journey. . . . I have just tried on my boy's costume, and I beg you to believe that I look very well in it." The perusal of these bright and delightfully vivid letters makes one regret the absence of a Mrs. Christopher Columbus, for probably but few such truthful and interesting accounts of travel have been written as those penned by this young Russian girl, who at the time she wrote was only nineteen.

OTHER ARTICLES.

The second number of the April *Nouvelle Revue* opens with a chapter of very charming recollections by Joseph de Nittis, a well-known Italian artist who has made France his country. Count Z. continues his gloomy exposition of France's "Maritime Peril." It is not necessary, says he, to be a sailor in order to understand that the French war fleet is constituted on no scientific principle, and he urges on naval officers the advantages of scientific study, while to the authorities he points out that France's future supremacy on the sea will entirely depend on the condition of employing the whole resources of her naval budget in the construction of new and powerful men-of-war, cruisers and torpedo boats.

Literature is represented by an amusing article on Molière at Toulouse by A. Baluffe. Molière seems to have taken from Languedoc many of the personages in his comedies, and it was in Toulouse that he wrote his first play, "L'Etourdi."

THE NEW BOOKS

I. OUR LONDON LETTER ABOUT BOOKS.

BEFORE beginning to describe a list of the best books this month selected from the numerous issues from the press, let me call special attention to the accompanying portrait of Mr. Benjamin Kidd, the almost unknown author of the universally-talked-of book on Social Evolution. To the most of those who have criticised his new book on "Social Evolution" he is "the Great Unknown." Even the omniscient *Spectator* had to confess, "We have not a notion what he is or who he is." So possibly a few particulars may not be uninteresting.

Benjamin Kidd is a near neighbor of mine both in the City and in the suburbs. I have known him for years as a careful thinker, a popular writer, a man of science, and a man of faith. He is still young. He is not more than

thirty-five, married, and in the Civil Service. He began "Social Evolution" in 1888, and has worked at it steadily for six years. It is his first work, and he is naturally as proud of it as a mother of her firstborn. It is rare indeed that any first books take the reading world by storm as his has done. Mr. Kidd has been a contributor to the magazines and a reviewer for some years. Articles anonymous and otherwise have appeared from his pen in the *Nineteenth Century*, *Cornhill*, the *English Illustrated*, *Longman's*, etc. Most of them dealt with scientific subjects.

I do not need to say anything about the book—which, by the way, he has described as the scientific basis for the social gospel of the REVIEW OF REVIEWS—feeling sure that

long ere this you have read it yourselves. But from a collection of criticisms you will find that, whether people agree with him or not, everybody, from the Duke of Argyll and Dr. Alfred Wallace down to the *Times* and the *National Observer*, is discussing him for the most part favorably. A book which Dr. Wallace declares is "thoroughly scientific," which Dr. Marcus Dods thinks is "one of the greatest books since Darwin's 'Origin of Species,'" and which the *Spectator* thinks may mark a turning point in the social controversy, is one of the books of the year, even if it be not, as Miss Ellice Hopkins insists, one of the books of the century.

But now, leaving Mr. Kidd and his portrait, which he—most reluctantly—was good enough to have photographed for me, let me congratulate you upon the quality of the book issues of the month. It never rains but it pours; and whereas in some months we have not one book above mediocrity, this month we have half a dozen. As for the books which have been selling best, one is glad to see that the excellent "Temple" Shakespeare still keeps a place. Two new volumes were issued during the month—"The Two Gentlemen of Verona" and "The Merry Wives of Windsor"—and more than ever convince one that this is the ideal pocket edition. But here is a little list of the books people are buying in London:

To Right the Wrong. By Edna Lyall.

The "Temple" Shakespeare. Volumes II and III.

MR. BENJAMIN KIDD.

Astrophel and Other Poems. By Algernon Charles Swinburne.

Town Life in the Fifteenth Century. By Mrs. J. R. Green.

Marcella. By Mrs. Humphry Ward.

Vox Clamantium: The Gospel of the People.

The Cup of Cold Water and Other Sermons. By the Rev. J. Morlais Jones.

The Prisoner of Zenda. By Anthony Hope.

But of all the notable and best selling books of the month I give the first place to the first book of another young author who has achieved a unique and brilliant success. In the two volumes of "*St. Teresa*" you will find that Mrs. Cunningham Graham has enriched not merely the literature of England by a masterly biography, but has made this generation her debtor by her wonderful restoration-resurrection, I may call it, of the greatest woman of Spain. The busy, bustling world spares little of its time to memories of the saints, but even in the last decade of the nineteenth century the busiest amongst us may well snatch an hour to linger in the company of the latest and greatest of the canonized of her sex. To-day, when every one admits that the era of womanhood is upon us, we cannot do better than study with reverence and admiration the sainted lady of Spain, who was the bright and morning star of that new era. Mrs. Graham, herself a daughter of the sunny land, has devoted herself for years to the study of St. Teresa's life on St. Teresa's ground. Some critics have shrugged their shoulders over the fervor of her enthusiasm. "The cold in clime are cold in blood," and it needed a child of the South to paint the Spanish saint with a brush steeped in the colors of Spanish landscape, and glowing with the radiance of the southern skies. Mrs. Graham, as a woman and a Spaniard, has two great qualifications for giving us a vivid intuitional description of her heroine, and she possibly succeeds all the better for her audience because she is neither Catholic nor mystic. No one really can understand St. Teresa who does not at least occasionally dwell in the borderland between this world and the next in which she spent her life, and you might as well attempt to explain the Puritans without the Bible, the constant background of their daily life, the atmosphere of their whole existence, as to interpret St. Teresa without a realizing sense of the presence of the invisible world. But despite that limitation, Mrs. Graham, as you will see, has really brought St. Teresa to life again after two centuries. Her work has been received with enthusiasm by the literary circles in Madrid, and Mrs. Graham, in her own sphere, has achieved as notable a success as Mr. Kidd.

A book of a very different kind is Lord Wolseley's "*Life of John Churchill, Duke of Marlborough*." It is the day of whitewash, and the victor of Blenheim is fortunate in finding such a whitewasher in the victor of Tel-el-Kebir. This biography of a soldier by a soldier is a valuable addition to the library of military history, and although the biographer holds a brief for his hero, not even his zeal can lead him to obscure or deny the inveterate tendency of Churchill to hedge, even when hedging meant treason. It is a fortunate thing for the readers of books that the Commander-in-Chief in Ireland can spend his time in inventing excuses for this professional traitor of two centuries since, instead of spending powder and shot upon those who with more excuse might emulate his example.

Another solid book of first-class importance is Mr. and Mrs. Sidney Webb's "*History of Trades Unionism*." The importance of this book lies, as you will readily perceive in turning over its pages, in the grasp of its authors on the fundamental fact that every trades union is in its

essence a Christian Church in embryo: the formation of a brotherhood, based upon principles of equality, and the helping of the weak by the strong, the unemployed by the employed. Trades unions are churches without sacraments, save the sacrament of service, but they care for the "least of these my brethren" much more than many of the ecclesiastical institutions. The authors, a kind of syndicate of two, are admirably qualified for their task and their book will become classic in the library of labor.

The laureateship is still held in reserve, so that Mr. Swinburne has had to publish his new collection of poems without the coveted title, which Lord Rosebery will have to bestow upon somebody. Most of the verses in "*Astrophel*" have already seen the light in periodicals. There is music and melody in the dedication to Mr. William Morris, enkindled with all the rapture and radiance of yore. Here are two of the verses:

Truth, winged and enkindled with rapture
And sense of the radiance of yore,
Fulfilled you with power to recapture
What never might singer before—
The life, the delight, and the sorrow
Of troublous and chivalrous years
That knew not of night or of morrow,
Of hopes or of fears.

But wider the wing and the vision
That quicken the spirit have spread,
Since memory beheld with derision
Man's hope to be more than his dead.
From the mists and the snows and the thunders
Your spirit has brought for us forth,
Light, music, and joy in the wonders
And charms of the North.

No poet had ever worthier themes than those which Mr. Swinburne has selected in this volume. England, Sir Philip Sidney, Tennyson, Browning, Grace Darling, are only a few of the subjects which any poet might envy, but which few indeed could have treated with such majesty of melodious song as the author of "*Poems and Ballads*."

You read "*Dodo*," of course, and disliked her. The author of her being has produced another story, "*The Rubicon*," which is own sister to "*Dodo*," and has had the unmerited good luck of being abused as extravagantly as its predecessor was praised. The society woman whom Mr. Benson loves to dissect is an unlovely creature. I am against suicide on general principles, but if all the *Dodos* and Lady Hayeses in real life went the way of prussic acid few tears would be shed. It is curious to note the glee of the *Tablet* in reproducing the *Standard's* vituperation of the morals of the book. It would almost appear as if our estimable Catholic contemporary had discovered in the novels of Mr. Benson a welcome reinforcement of the arguments against the marriage of the clergy—at least when they happen to be Archbishops.

Among other notable novels are Mr. George Moore's "*Esther Waters*," a study of life in the kitchen, the tap-room and the racecourse, and Mr. Anthony Hope's "*Prisoner of Zenda*"—books so dissimilar in every respect that it is strange to see their names bracketed in the same paragraph. You will want to see "*Esther Waters*," not only because of your interest in the study by a some time disciple of M. Zola of illiterate Abigails in labor and in service, but because you will naturally desire to see a work proper enough for the austere Mudie, but too shocking for the modesty of W. H. Smith and Son. Style is certainly not one of the many good qualities which the book possesses, but of the grasp of his characters and of their life Mr. Moore has the fullest measure. His is a great success. It is a low life which he presents—a life

where horse racing is the be all and end all of existence—but he has presented it with the hand of an artist.

To turn to "The Prisoner of Zenda" is to escape from the fog and murk of a November London to the sun and bright fancy of romance. Indeed, a more gallant, entrancing story has seldom been written. Reminiscent of Mr. Stevenson in some of his most fanciful moods, this tale of a German principality has the fascination of the great romance, the appeal of Dumas and Walter Scott. The reader is hurried along in a whirl of intrigue and excitement, what time he wonders how so complicated a medley of circumstances can be unraveled. Mr. Hope was a promising writer when he wrote "Mr. Witt's Widow" and "Father Stafford;" to-day, if his work does not fall off in quality, he enters upon a career as one of our foremost writers of romance.

Two books for Sunday reading are not quite likely to contribute much to your comfort, but rather to stir your conscience and to rouse you to action. One is "Vox Clamantium," the voice of those crying in the wilderness. Among the criers you will find a motley company, beginning with Mr. Hall Caine and including among others Mr. Grant Allen, Mr. Walter Crane and Mr. Tom Mann. The gist of what they have to say is that there are a great many people in the world who are very unhappy, and that you and I have no right to enjoy ourselves in our easy chairs until at least we can honestly say that we have done everything that we possibly can to ameliorate the conditions of those who are less happy. The other book is exclusively clerical; "Lombard Street in Lent" is a collection of sermons preached during Lent in Lombard street. They are very notable in their way, and within their cover you get a summary of the message of the more advanced school in the Church of England to the people of England.

In literary criticism there is nothing produced better this month than Mr. Stopford Brooke's Tennyson. It is a volume which should be placed side by side with the collected editions of the late laureate's works. Mr. Stopford Brooke has been a life-long student of the greatest poet of the Victorian era, and in this volume he gives us the cream of his thought. Tennyson, according to Mr. Stopford Brooke, was "conscious all his life of being set apart as a prophet, and of the duties which he owed to humanity." As a prophet Mr. Brooke treats him, and as a commentary upon Tennyson the present volume will take a leading, if not a permanent, place as an excellent study upon the poet and his art.

Seventeen years ago (dear me, how the time flies!) there were no dispatches in the Blue Books which were more intelligent than those which bore the name of Lord Augustus Loftus. At that time he was British Ambassador at the Court of St. Petersburg, and upon the assurances given to him the peace of Europe chiefly hung. All this and much more is brought back to the mind by the publication of the second series of Lord Augustus Loftus' "Diplomatic Reminiscences." Another two-volume book of great importance is Mrs. J. R. Green's "Town Life in the Fifteenth Century."

"The Yellow Book" is the first of a series of quarterly books which are to have yellow backs and are to be bound in cloth instead of being printed as all other periodicals with paper covers. The contents are very miscellaneous indeed, chiefly poetry, art, fiction, by a strangely mixed group of contributors. Leading off with Mr. Henry James, who sends a longish short story in his best style, it contains of the older men Mr. Edward Gosse and Mr. Saintsbury, and of the younger Mr. George

Moore, Mr. Le Gallienne, Mr. Arthur Symonds, and Mr. Arthur Waugh. Its illustrations—entirely independent of the letterpress—proceed in the most part from the supporters of the New English Art Club—Mr. Walter Sickert, Mr. Steer, Mr. Furze, Mr. Beardsly, Mr. Rothenstein, and others—but Sir Frederick Leighton has two studies.

Mr. Standish O'Grady's "The Story of Ireland" is a successful attempt at a popular, readable Irish history. This month comes another book from the same pen, a story, "Lost on Du Corrig," an exciting romance of the wild Irish coast, honeycombed with caves. The book's style is good, and there are many illustrations by Mr. John Gülich. If I am not much mistaken you will spend a rapt hour with "Lost on Du Corrig." Then, if you want to be popular pass it on to some boy—for it is above all a boy's book. And talking of books for children, I may mention the four volumes of the School and Home Library—Southey's "Life of Nelson," Waterton's "Wanderings in South America," Dana's "Two Years Before the Mast," and Anson's "Voyage Round the World." They are wonderfully cheap at one and four-pence each, and look exceedingly creditable. Perhaps you might care to give them to your village or school library.

If you are an admirer of Dumas (which Heaven bring!) you will enjoy reading a volume of literary essays, "Romantic Professions," by Mr. W. P. James, who shows himself by constant reference and eulogy a true reader of the author of "Monte Christo." In his eight essays Mr. James deals almost entirely with subjects pertaining to the novelist's profession. "On the Naming of Novels," "Names in Novels," "The Historical Novel:" here are three of his titles. He has a winning, allusive, learned style, brimming over with good spirits. You will find another book of peculiar literary interest, "'Junius' Revealed," by Mr. H. R. Francis, who claims to be the surviving grandson of the author of the famous little-read letters. You may enjoy reading two plays in separate volumes, translated from the Norwegian of Bjørnstjerne Bjørnson. Both "Pastor Sang" and "A Gauntlet" are "thesis plays:" the one deals with the subject of faith-healing in a manner somewhat cryptic but always interesting; the other with the question of the prenuptial chastity of man. Among the miscellaneous books worthy of note are two new volumes of the Badminton Library, "Big Game Shooting," for which Mr. Clive Phillips-Wolley is mainly responsible. A perfect treasury of hunting adventure, these two sturdy volumes, packed with illustrations, are just the books for a country house library. Then there is a translation by Lady Mary Loyd of Viscomte Robert du Pontavice de Heussey's "Villiers de l'Isle Adam: His Life and Works;" and a volume of Phillips Brooks' "Addresses," edited by the Rev. Julius H. Ward.

I have left myself but little room to speak of some important new editions. The most interesting is, I think, the new volume of the Mermaid Series—"The Best Plays of Richard Steele," edited by Mr. G. A. Aitken, a great authority upon the period. I cannot again repeat my praise of Mr. Wheatly's edition of Pepys' "Diary," or of Dr. Skeat's "Chaucer." It should be sufficient to heartily welcome the fourth volume of the one and the second of the other. Then to the Aldine Edition of the British Poets has been added Samuel Butler, in two volumes, edited by Mr. R. Brimley Johnson. And to the Library of Old English Authors has been added a single-volume edition, for which Mr. J. W. Ebsworth is responsible, of Carew.

II. SOCIALISM AND SOCIAL REFORM.

DR. ELY'S NEW VOLUME.*

THE appearance of a new work by Professor Ely dealing with socialism and programmes of social reform would be a noteworthy event at any time; but at the present moment the fact has a special significance, first because of the growing interest in the general subject, and secondly because the group of American writers and thinkers on social topics among whom Dr. Ely has long been a recognized leader, is just now more aggressively active than ever before, and there is a wide-spread interest in its every utterance. Students will turn to the book to find a scientific analysis and discussion of modern socialistic theories. It is entirely within bounds to say that no American is better qualified than Dr. Ely to undertake such an analysis. Our reading public has not yet forgotten the enlightening and wholesome influence of "French and German Socialism in Modern Times," which gave us a sane and unprejudiced statement, some ten years ago, of what European socialism really meant. In his present work the author attempts a far more exhaustive treatment of the subject, and ventures on philosophical reflections concerning the nature of representative socialistic schemes. In dealing with the weakness of socialism Dr. Ely points out also the weakness of opposing arguments which are frequently used; but states candidly and without reserve his own objections as conceived in a thoroughly American spirit. As chief among these objections he considers "the tendencies to revolutionary dissatisfaction which it would be likely to carry with it; the difficulties in the way of the organization of several important factors of production under socialism, notably agriculture; difficulties in the way of determining any standard of distributive justice that would be generally acceptable and at the same time would enlist the whole-hearted services of the most gifted and talented members of the community; and finally, the danger that the requirements of those engaged in higher pursuits would be under-estimated, and the importance of those occupations which contribute most to the advancement of civilization should fail to secure adequate appreciation."

HIGH SOCIAL IDEALS.

It hardly needs to be said that Dr. Ely's frank acknowledgments to socialism render his propositions for a "golden mean" of practicable social reform only the more entitled to consideration. What he has to offer as a solution of our social problems appeals to us with all the greater force because it comes from one who has given some of the best years of his life to a diligent effort to know "the best that has been thought and said in the world" by the most radical exponents of social regeneration. That he accepts the high ideals of socialism and seeks to realize them by other than revolutionary means makes his programme of reform the more worthy of our earnest attention. It is this portion of Dr. Ely's book which most of our readers, we are sure, are chiefly desirous of acquainting themselves with. To quote from the introductory chapter on practicable social reform:

"Some of the things which we must strive to accomplish in social reform may be enumerated as follows: First of all, we must seek a better utilization of product-

ive forces. This implies, unquestionably, that we should reduce the waste of the competitive system to the lowest possible terms; positively, that we should endeavor to secure a steady production, employing all available capital and labor power; furthermore, the full utilization of inventions and discoveries, by a removal of the friction which often renders improvement so difficult. Positively this implies also that production should be carried on under wholesome conditions. In the second place, would we secure the advantages of socialism, we must so mend our distribution of wealth that we shall avoid present extremes and bring about widely diffused comfort, making frugal comfort for all an aim. Distribution must be so shaped, if practicable, that all shall have assured incomes, but that no one who is personally qualified to render service shall enjoy an income without personal exertion. In the third place, there must be abundant public provision of opportunities for the development of our faculties, including educational facilities and the large use of natural resources for the purposes of recreation."

WHAT TO DO.

As a means to these desirable ends, Dr. Ely recommends, in the first place, the socialization of natural monopolies. His views on this question are so well known that their amplification is not required here. In the field of agrarian reform, his propositions are moderate. He would tax all unused land at its full selling value, and that, as he explains, means simply carrying into effect existing laws. To secure for the general public a larger share than it now enjoys of the "unearned increment," he suggests that all extensions of cities be carried out by the cities themselves. He also advocates the leasing, rather than the sale of public lands. His chapter on what he terms the development of the social side of private property is extremely suggestive. "This," he says, "does not mean that private and social rights are to be fused or confused in such a manner that no one can tell where one begins and the other ends. Quite the contrary. What is needed is even a clearer definition of rights, both individual and social, than that which now exists."

We have quoted sufficiently to show that Dr. Ely is far from being a social revolutionist. Indeed, so moderate do his demands appear that the casual reader is in danger of minimizing their importance, and yet we are sure that a thoughtful study of the book will produce the conviction that many of its suggestions are entirely practicable, and if adopted would lead only to salutary results. At all events it is a book for thoughtful men of to-day to read and ponder in preparation for the serious work of to-morrow.

THE CHURCH IN SOCIETY.

Essays by Professors Ely, Commons and Herron.

Professor Ely's views on the relations of the Church to modern society have attracted much attention for many years. Naturally they do not claim large space in his latest work, but were fully set forth in a little volume published in 1889, a new edition of which has recently appeared.* The essays collected in this book embody some of the earliest pleas made by any American writer for a

* Socialism; an Examination of its Nature, its Strength and its Weakness, with Suggestions for Social Reform. By Richard T. Ely, Ph.D., LL.D. 8vo. New York: Thomas Y. Crowell & Co.

* Social Aspects of Christianity, and Other Essays. By Richard T. Ely, Ph.D., LL.D. 12mo, pp. 171. New York: Thomas Y. Crowell & Co. 90 cents.

recognition and emphasis of the social side of the Church's mission. Very recently several contributions have been made to the literature of religio-social reform by American writers whose thinking has been directed along the lines laid down in Dr. Ely's essays. Dr. Josiah Strong's book entitled "The New Era" appeared last summer, and was reviewed in this magazine at the time.* The work is characterized by a most effective presentation of statistics and careful deductions therefrom. The necessity of co-operation among religious forces is the central truth which Dr. Strong enunciates and emphasizes.

As suggestive of certain definite reforms in society into which the energies of the modern Church should be projected, the essays of Professor Commons are worthy of note.† This writer believes that the Church is commissioned to deal with the problems of poverty, of temperance and of municipal, State and national politics. His point of view is distinctly that of the scientific sociologist, within the Church, thoroughly possessed of the humanitarian impulse which is behind the words of Professor Ely and Doctor Strong.

From what has been said of the three authors already mentioned, it will be rightly inferred that appeals to the

* See REVIEW OF REVIEWS, September, 1893.

† Social Reform and the Church. By John R. Commons. 16mo. pp. 186. New York: Thomas Y. Crowell & Co. 75 cents. (See REVIEW OF REVIEWS, May, 1894.)

sober judgment of their readers occupy a large portion of their writings. This can hardly be said of the lectures and addresses by Professor Herron.* Holding the unique chair of Applied Christianity in Iowa College, this new leader among Christian sociologists finds his mission in arousing the slumbering conscience of the Church, and this he seeks to do by fervid appeals to the heart rather than to the head. His message, as he utters it, is the logic of Ely, Strong and Commons on fire. No member of the group surpasses him in the "art of putting things," and the things that he puts before his constituency of students and Church members are truths that the twentieth century is likely to value more highly than the nineteenth does. His whole call to the Church of to-day is embodied in this sentence: "The Church was not sent to be an institutional dominion, but a sacrificial and redemptive life in the world."

The vigorous Western college which Dr. Herron serves is taking an advanced position in the field of religious education. Next month it will be the rallying point of the forces represented by the American Institute of Christian Sociology, a national organization which, to judge from the literary vigor of its leading spirits, is not likely to lack in vitality as it widens the circle of its influence.

* The Christian Society. By George D. Herron, D.D. 12mo, pp. 158. New York: Fleming H. Revell Company. \$1.

RECENT AMERICAN PUBLICATIONS.

HISTORY, ECONOMICS AND SOCIAL SCIENCE.

The Muhammadans in India 1001-1761. By J. D. Rees, C.E.I. 16mo, pp. 202. New York: Longmans, Green & Co. \$1.

The author of "The Muhammadans in India" traverses ground which to most American readers, even to those of scholarly bent, is truly a *terra incognita*. Perhaps one of the most striking things in the book is the unusual spelling adopted—particularly in the case of the name used to designate the prophet of Islam. We are assured, however, that the spelling of proper names is according to the system authorized by the government of India.

A Short History of the Crusades. By J. I. Mombert, D.D. 12mo, pp. 301. New York: D. Appleton & Co.

Dr. Mombert's aim in the preparation of this work has been "to give to busy people a narrative of the grand drama of the Crusades." He tells the story in a succinct and vivid way; his treatment of the whole subject is clearly based on a discriminating use of authorities, and as a compact presentation of the theme the book will probably prove more useful than any of its predecessors in the field.

Europe, 1598-1715. By Henry Offley Wakeman, M.A. Period V. 12mo, pp. 400. New York: Macmillan & Co. \$1.40.

Although chronologically fifth in the series of "Periods of European History," the present work is the third to appear. Periods I (A.D. 476-918) and VII (A.D. 1789-1815) having preceded it in publication. The scheme of the series differs from that of the "Epochs of History" in that the record of the centuries is more closely followed, with less effort to group the facts about certain central events or movements. In the present volume, however, the author finds that the development of France gives a sort of unity to the history of the seventeenth century, the period under review. "Round that development, and in relation to it, most of the other nations of Europe fall into their appropriate positions and play their parts in the drama of the world's progress."

Town Life in the Fifteenth Century. By Mrs. J. R. Green. Two vols., 8vo, pp. 457, 476. New York: Macmillan & Co. \$5.

As the late John Richard Green was one of the first of England's historians to adequately appreciate the importance and meaning of municipal life in the national development, so his widow is one of the first of English scholars to attempt a critical and sustained study of that life. The period she has chosen may not be regarded as a very interesting one, but she has seized upon the distinctly interesting phases of the period. From her point of view the boroughs of the fifteenth century were "the schools in which the new middle class received its training for service in the field of national politics, and the laboratories in which they made their most fruitful experiments in administration." The common life of the towns is studied in the light of the vast industrial and commercial changes of the time. The guilds and crafts of those days are faithfully portrayed, and the salient features of mediæval society receive painstaking treatment.

The Struggle of Protestant Dissenters for Religious Toleration in Virginia. By Henry McIlwaine, Ph.D. Paper, 8vo, pp. 67. Baltimore: The Johns Hopkins Press. 50 cents.

Professor McIlwaine's monograph treats of the period which began with the year 1649 and ended with the French and Indian War. This period embraced the rise of the Quakers in Virginia, the settlement of French Huguenots and Germans on the frontiers, and later the influx of Presbyterians and other Dissenters, especially among the Scotch-Irish immigrants. This study fittingly supplements that of Dr. Daniel R. Randall on "A Puritan Colony in Maryland" (Johns Hopkins Studies. 1886).

Sources of the Constitution of the United States Considered in Relation to Colonial and English History. By C. Ellis Stevens, LL.D. 12mo, pp. 289. New York: Macmillan & Co. \$1.50.

Dr. Stevens holds the view now generally accepted by scholars as to the English origin of American civil institutions. Those who are interested in the theory of Dutch influence broached by Douglas Campbell will find opposing arguments forcibly presented in this volume. Possibly the author is inclined to underrate the value of the work done by American students in the field of their own institutional history. None of the conclusions reached by Dr. Stevens will seem novel to them.

Complete Works of Abraham Lincoln. Comprising His Speeches, Letters, State Papers and Miscellaneous Writings. Edited by John G. Nicolay and John Hay. Two vols., 8vo, pp. 695, 770. New York: The Century Company.

As a fitting supplement to their monumental life of Lincoln, Messrs. Nicolay and Hay have prepared a two-volume edition of his complete works. Everything of public interest that Lincoln wrote, from his address to the voters of Sangamon County, in 1832, to his last public speech, as President, in April, 1865, may be found in these volumes. The names of the editors form a sufficient guaranty of the trustworthiness of the work.

The Diary of Samuel Pepys, M.A., F.R.S. Edited, with additions, by Henry B. Wheatley, F.S.A. Vol. IV. 12mo, pp. 424. New York: Macmillan & Co. \$1.50.

Volume IV of Mr. Wheatley's edition of the famous diary contains the entries from the first of January, 1664, to the middle of 1665. The four illustrations include a portrait of Pepys from the picture by Sir Godfrey Kneller, and a portrait of the Duke of York, later James Second, from the painting by Sir Peter Lely. The external equipment of this edition, which is added to Bohn's "Historical Library," is as admirable as the editorial supervision.

Recollections of a Virginian in the Mexican, Indian and Civil Wars. By Gen. Dabney H. Maury. 12mo, pp. 290. New York: Charles Scribner's Sons. \$1.50.

General Maury, recently United States Minister to Colombia, has recorded his recollections in the spirit of a soldier and a faithful son of the Old Dominion. He has adopted a plain, straightforward style, easy and anecdotal, and his experiences have enabled him to give the reader some glimpses of Stonewall Jackson, Lee, Grant, Scott and other eminent military Americans. General Maury, after graduation from West Point, saw service in the Mexican War, in wars with the Indians, and at the outbreak of the Civil War immediately entered the ranks of the Confederacy. His pages will be of special interest to Virginians, but there is much in them which will entertain a wider public.

"Junius" Revealed by His Surviving Grandson, H. R. Francis. Octavo, pp. 82. New York: Longmans, Green & Co. \$1.75.

Another volume is added to the already extensive literature of the "Junius" controversy. The author, H. R. Francis, makes a *résumé* of the evidence in support of the claims of his grandfather, Philip Francis, to the authorship of the famous letters.

A Canadian Manual on the Procedure at Meetings of Municipal Councils and Public Bodies Generally. By J. G. Bourinot, C.M.G., LL.D. Octavo, pp. 452. Toronto: The Carswell Company.

Mr. Bourinot's manual is intended to do for parliamentary procedure in Canada what Cushing's, Robert's and Reed's Rules do for public assemblies in the United States. It contains not only the rules of Parliament, but regulations for the procedure of all kinds of public meetings. One chapter is devoted to the procedure of church assemblies and courts.

Progressive Taxation in Theory and Practice. By Edwin R. A. Seligman. Paper, 8vo, pp. 222. Baltimore: American Economic Association. \$1.

Progressive taxation, as usually understood, is based on the popular desire to secure what Mill called "equality of sacrifice." It is assumed that a man worth \$20,000 can bear a tax of 1 per cent. as easily as a man worth \$10,000 can endure half that rate. The whole matter receives new significance from the present discussion of a national income tax in this country. Hence the timeliness of Professor Seligman's monograph, which is the first complete presentation of the subject in the English language. The author himself concludes, however, that the practical difficulties in the way of any general application of the principle of progressive taxation are almost insuperable, and that for the United States the only tax to which the progressive scale is at present applicable is the inheritance tax.

Relation of Taxation to Monopolies. By Emory R. Johnson. Paper, 8vo, pp. 93. Philadelphia: Am. Acad. Pol. and Soc. Science. 25 cents.

Dr. Johnson discusses in his paper the basis of monopolies, setting forth their real nature, and classifying them as sharers in the surplus arising from production, and elaborates so much of the general theory of taxation as pertains to taxes levied with the sole purpose of yielding the state a revenue.

The Control of the Purse in the United States Government. By Ephraim D. Adams. Paper, 8vo, pp. 62. Lawrence, Kan.: The University Quarterly.

It is a principle of our federal constitution that all revenue bills shall originate in the House of Representatives, rather than in the Senate. So broad a construction has been put on this privilege that the House has practically assumed control over all financial matters. The theory of the constitution is that the people, through their representatives, shall have the direction of all expenditures. Do the people, in fact, exert such control? This is the question which Dr. Adams undertakes to answer in this monograph on the "Control of the Purse." He concludes that while budgetary legislation is of the greatest importance to the nation (free trade, protection, pensions, and internal improvements being questions of the budget), the vote of the people does not really determine legislative action on matters connected with public revenues and expenditures. The committee system renders the accountability of representatives to their constituents practically impossible. The writer discusses various proposed reforms intended to secure effective responsibility to the voters, but concedes that every one of these involves a change in the theory of our constitution, since a partial union of executive and legislative functions is required. Dr. Adams is fully justified, we think, in his contention that the demand of the times is for a responsible government, which, he asserts, "must always interpret honestly and put in force promptly whatever seems to be the nation's clearly expressed will." The monograph bears every evidence of exhaustive and critical research.

Public Libraries in America. By William I. Fletcher, M.A. 16mo, pp. 169. Boston: Robert Brothers. \$1.

Mr. Fletcher has succeeded in bringing together in a compact volume a great deal of useful and interesting information about libraries. Especially to be commended is the discussion of the relations of the library and the community. There are also many valuable suggestions to persons concerned with the starting or administration of public libraries. The professional librarian knows where to look for the established aids of his craft, but the library trustee in the small town has heretofore been almost without a guide in his labors. This little manual will serve admirably as such a guide. The chapter on classification is separately printed.

Proceedings of a Conference on the Care of Dependent and Delinquent Children in the State of New York. Paper, 8vo, pp. 170. New York: State Charities Aid Association. 20 cents.

The papers and discussions at the conference called last November by the New York State Charities Aid Association to deliberate concerning the care of dependent and delinquent children are of permanent value. An immense amount of useful statistical matter is presented in convenient form. Of especial importance is the concluding paper, prepared by the Association, on the support of children at public expense in the private institutions of New York City.

Report on Governmental Maps for Use in Schools. Paper, 12mo, pp. 65. New York: Henry Holt & Co. 30 cents.

Woman's New Opportunity. By Daniel Greenleaf Thompson. Paper, 12mo, pp. 16. New York: Longmans, Green & Co. 25 cents.

Industrial Training in Reformatory Institutions. By Franklin H. Briggs. Paper, 8vo, pp. 13. Syracuse: C. W. Bardeen. 25 cents.

PHILOSOPHY, PSYCHOLOGY AND MORALS.

Fallen Angels. By One of Them. Octavo, pp. 246. London: Gay & Bird.

What, then, is the significance and value of this pitiable human life, of its suffering and degradation? "Granted that human life is mean, how did we find it out?" Speculating upon such questions as these the anonymous author of the present work has arrived at the theory—and she (?) distinctly states that her solution is only hypothetical, and in our present state of knowledge, incapable of proof—which seems to the writer consistent and consolatory. "The main suggestion of this work, then, is that human beings were angels, and dwelt originally in purity and light, as emanations from the Divine; but that having fallen, we are being graciously led back to Heaven by gradations of instruction." This view is worked out in a series of short chapters containing supporting evidence from an exceedingly wide range of reading—from Edna Lyall and Marie Corelli to Virgil and Dante in the orig-

mal. The author rests the hypothesis largely upon a belief in a righteous and loving God, and writes with a strong Christian bias. The style is fortunately extremely simple and elevated; the book is a suggestive one, it is seriously written with a desire of satisfying the reason and the soul. It is not probable that the majority of readers will be won to the hypothesis of this "fallen angel," but those who love the realm of mystical speculation will not consider it a waste of time to ponder over these pages.

Hume: With Helps to the Study of Berkeley. Essays. By Thomas H. Huxley. 12mo, pp. 334. New York: D. Appleton & Co. \$1.25.

The sixth volume of Huxley's "Collected Essays" is mainly devoted to David Hume, whose character and philosophy seem to Mr. Huxley to be of the highest value. In the preface of the present volume the scientist takes occasion to commend Descartes and modern philosophy in general, and in his brusque manner to give another kindly blow at the idealists. In contrast to the teaching of Socrates, "the first agnostic," Mr. Huxley calls him—"the Platonic philosophy is probably the grandest example of the unscientific use of the imagination extant; and it would be hard to estimate the amount of detriment to clear thinking effected, directly and indirectly, by the theory of ideas, on the one hand, and by the unfortunate doctrine of the baseness of matter, on the other."

The Diseases of the Will. By Th. Ribot. 12mo, pp. 140. Chicago: Open Court Publishing Company. 75 cents.

Ribot's works, while scientific to the extreme, are written in so clear a style and are so representative of one of the great lines of study in our day that they appeal to any intelligent reader who is interested in the problems of psychology. The Open Court Publishing Company furnishes the public with an authorized translation, by Merwin-Marie Snell, of the eighth edition of "*Les Maladies de la Volonté*." The scientist's conclusion in this short monograph is that the will of rational man "is an extremely complex and unstable coordination, fragile by its very superiority, because it is 'the highest force which nature has yet developed—the last consummate blossom of all her marvelous works.'"

Courage. By Charles Wagner. 12mo, pp. 237. New York: Dodd, Mead & Co. \$1.25.

Mr. Wagner's name was made familiar to the American public, especially to the young people of the country, by a translation of his "Youth" which appeared some months ago. The new work which bears the appropriate title "Courage" addresses itself to all earnest young persons and is intended to place before their minds and hearts a "few necessary suggestions for a working ideal." Mr. Wagner seems to have felt the strong currents of evil which oppress our moral day, and in vigorous opposition to pessimism and laxity of principle and acquiescence to arbitrary convention, he urges the necessity of individual energy, and a courageous, intelligent stand for the right. The author's style and treatment are very simple and fitted for wide popular reading, but the ideas back of them are by no means shallow; they herald, so let us hope, a deeper moral spirit among the young people of our generation. The book is a companionable stimulus, not a labored treatise. It can harm no one and to many may prove of high service. Among Mr. Wagner's chapters are those upon "The Value of Life," "Obedience," "Simplicity," "Heroic Education," "Effort and Work," "Manly Honor," etc.

RELIGION, CHURCH HISTORY AND MISSIONS.

Was the Apostle Peter Ever at Rome? By Rev. Mason Gallagher, D.D. 12mo, pp. 265. New York: The Methodist Book Concern. \$1.

Dr. Gallagher's book, which is written from the standpoint of an aggressive Protestantism, is introduced by Dr. John Hall. The author's aim has been to show that the Papal claim to a direct descent from St. Peter is fallacious. He has examined an extended list of authorities, Catholic and Protestant, particularly those eminent in legal qualifications, and his paper consist largely of direct quotation of their opinions. Dr. Gallagher's conclusion after investigation of the testimony of the Bible, of the early Church fathers, and of modern scholarship, is that it is not at all probable the Apostle Peter was ever in the Eternal City. The author's labor has been one of zeal, if not of calm disinterestedness. He believes that the question considered is a very important one. "If this main pillar of the Roman Catholic Church is thus seen to rest on quicksand, why may not other supports of that institution be equally insecure?"

Papers of the Jewish Woman's Congress. Held at Chicago September 4, 5, 6 and 7. Octavo, pp. 270. Philadelphia: Jewish Publication Society of America.

The gathering of the Jewish women as a branch of the Parliament of Religions last autumn was a success beyond expectation. It resulted in a national organization, and the longest paper of the present volume is explanatory of the need and the purpose of an American association of Jewish women. Other papers give historical matter relating to the position of woman in the Judaistic system from ancient times to recent, to women in Jewish literature, to present condition of their charitable work in America, and to other kindred topics. The papers are of a high order and indicate a progressive and liberal spirit.

Amid Greenland Snows; or, The Early History of Arctic Missions. By Jesse Page. 12mo, pp. 160. New York: Fleming H. Revell Co. 75 cents.

The author of this little volume has chosen a rather remote field of missionary history for investigation and has been able to write a very simple narrative which either a child or a grown person interested in missions may read with pleasure. Some attention is given to the customs and religious ideas of the Greenlanders, but the value of the book is its story of the heroism and persistent purpose of Hans Egede, who went as a pioneer missionary from Norway early in the eighteenth century, and of the Moravian brethren who followed. There are a number of illustrations.

James Gilmour and His Boys. By Richard Lovett, M.A. 12mo, pp. 288. New York: Fleming H. Revell Company. \$1.25.

James Gilmour, who passed away only three years ago, stands prominent in the annals of missionary history as the "Apostle of Mongolia." The contents of Mr. Lovett's new volume consist largely of letters written by the missionary to his little boys at school in England. These letters, many of which are in *fac-simile* of the manuscript, show the heart of a simple and enthusiastic nature, and they relate a good many interesting things about the people and the Christian evangelist's life in Mongolia. A map and a large number of illustrations will serve to increase the attractiveness of the little work to young people.

Broken Bread for Serving Disciples. By Mr. and Mrs. Geo. C. Needham. 12mo, pp. 224. New York: Fleming H. Revell Company. \$1.

Mr. and Mrs. Geo. C. Needham, well-known evangelists, have prepared a volume which may be considered a companion to their earlier issues, "Bible Briefs." These chapters are exceedingly brief outlines and suggestive thoughts upon cardinal evangelistic themes, which are usable for sermons or talks. They are written in a spirit of devotion to the cause, even to the point of sacrifice of much that the world holds dear, and are, as the title hints, eminently Biblical in tone.

The Bible in Private and Public. By Arthur T. Pierson, D.D. Paper, 12mo, pp. 50. New York: Fleming H. Revell Company. 25 cents.

Doctor Pierson's pamphlet is largely devoted to practical suggestions concerning the purpose and most efficient methods of reading the Bible in public.

CRITICISM, ESSAYS AND BELLES-LETTRES.

Tennyson: His Art and Relation to Modern Life. By Stopford A. Brooke, M.A. 12mo, pp. 516. New York: G. P. Putnam's Sons. \$2.

A twelvemonth or so ago we chronicled in these columns the appearance of Mr. Stopford Brooke's scholarly and entertaining volume upon the very earliest literature of England. But Mr. Brooke has been a life-long and earnest student of the literary art of his own time as well as that of by-gone years. His study of Tennyson is a sober and noble piece of work, and without any doubt will take a high place among the really helpful commentaries upon the late poet laureate. Mr. Brooke's title suggests correctly the broad human spirit in which he approaches his subject. In fact it is Tennyson as a moral force through the agency of beauty and as teacher and interpreter of the inner life who appeals chiefly to the author, though he does not neglect the poet's mastery over the technical possibilities of verse. To Mr. Brooke Tennyson was a prophet, an apostle of the beauty and worth of human life amidst the beauty and awe of nature, and in presence of the sure mystery of immortality; an egoist upon principle, and that he might by a physical, personal seclusion enlarge in other men the scope of spiritual experience. The introductory pages consider the laureate as an artist, his relation to Christianity and to social politics. Mr. Brooke's general method has been to follow the chronological order of the poet's production, so that we are enabled to trace his development from the first weak "Poems of Two Brothers" in 1827

down to the last work. A very large space is given to the "Idylls of the King," and there are separate chapters upon "Speculative Theology" and "The Nature-Poetry." While Mr. Brooke's respect and appreciation of the poet are deep, he shows his critical ability when he points out Tennyson's failure to grasp the meaning of the modern democratic movement and the larger social hopes of our day. "Through the whole of Tennyson's poetry about the problem of man's progress this [conservative] view of his does damage to the poetry, lowers the note of beauty, of aspiration, of fire, of passion, and lessens the use of his poetry to the cause of freedom." And it may not be amiss to give Mr. Brooke's own opinion upon the question of a social regeneration: "For my part, I do not think we have any right to think of a heaven for others, much less of a heaven for ourselves in the world to come, until we are wholly determined to make this world a heaven for our fellow-men, and are hoping, believing, loving and working for that and for its realization not in a thousand or a million years, but in a nearer and nearer future. That is what a poet should feel and write for nowadays. That should be the passion in his heart and the fire in his verse."

Studies in the Evolution of English Criticism. By Laura Johnson Wylie. 12mo, pp. 220. Boston: Ginn & Co. \$1.10.

The study of literary criticism has within the past few years been finding place for itself in the work of our higher institutions of learning. Miss Wylie's series of studies is published under the auspices of Yale University, and it is interesting as an evidence of this renaissance of critical study and as one of the first results to scholarship of the opening of post-graduate courses to women at New Haven. Miss Wylie's book, which treats of Dryden, "The Evolution Out of Classicism," "The German Sources of Coleridge's Criticism" and of Coleridge himself, is a readable and valuable volume for any one seriously interested in English literature, and it is a proof that a doctor's thesis may be an attractive piece of literature itself, without offending the canons of research.

English Prose. Selections with Critical Introductions. Edited by Henry Craik. Vol. II. 12mo, pp. 611. New York: Macmillan & Co. \$1.10.

The second volume of Mr. Craik's "English Prose," which covers the period of the sixteenth century up to the Restoration, opens with Francis Bacon and closes with L'Estrange. The editor's general introduction is a critical survey of the whole period in so far as it is concerned with the writing of prose English, and with the selections from each writer are given biographical outlines and critical summaries by various hands. Many eminent and familiar names appear in the "Contents:" of the somewhat more than forty authors from whom selections are taken most space is given to Lord Clarendon and to Milton. Mr. Craik's series can hardly fail to be of eminent service to all students of the general development of English style and thought.

Selections from the Poetry and Prose of Thomas Gray. Edited by William Lyon Phelps. 12mo, pp. 229. Boston: Ginn & Co. \$1.

Mr. Phelps' name has been recently and favorably introduced to the educational world through the agency of his "Beginnings of the English Romantic Movement." In editing Gray he has been particularly careful to follow the authentic texts. All the important poems are included, arranged in chronological order, with extensive notes and considerable selections from Gray's prose. A portrait of the poet is given, a bibliography, and Mr. Phelps has written of some interesting things in his introduction. The book belongs to the "Athenum Press Series."

Wayside Sketches. By Eben J. Loomis. 12mo, pp. 188. Boston: Roberts Brothers. \$1.

The reader of Mr. Loomis' essays will not find any profound utterances upon man or nature, but he may while away a leisure moment by enjoying a simple account of some of the author's strolls afield in the neighborhood of Washington. The author has also given here and there a bit of easy verse upon out-door subjects, and a few chapters having an infusion of fiction might fall under the title fantasy. Mr. Loomis is one of the large band of present-day writers who can "confidently recommend quiet walks in the country, and a loving observation of the processes of nature as a cure for unhealthy introspection, to say nothing of *ennui* and *dyspepsia*."

In Maiden Meditation. By E. V. A. 16mo, pp. 217. Chicago: A. C. McClurg & Co. \$1.

The quality the reader will find in these chapters bears no slight resemblance to that of the ever-classic "Reveries of a Bachelor," and it is not at all improbable that an acquaintance with *Ik Marvel*'s imaginings stimulated the preparation of a kindred, companion series of meditations from the other

side of the question. Love is here the important, the underlying, though not the sole theme; love as it presents itself to a charming and philosophizing young woman "After the Ball," "After Dinner," and after that one satisfying summer when friendship deepened into passion. The surface of these meditations is light and changeable, but beneath there is the power and the mystery of a woman's heart-life. In hours of gentle reverie young men and young women and all who can still sympathize with the impulsiveness and uncertainty of youth will very probably be entertained and more or less moved by these graceful and confidential essays.

With the Wild Flowers, from Pussy-Willow to Thistle-Down. By E. M. Hardinge. 12mo, pp. 283. New York: The Baker & Taylor Co. \$1.

The essays which are here gathered have for the most part heretofore appeared in *Demorest's Family Magazine* and in the *New York Evening Post*. They are botanical rather than literary in spirit, but are written in an easy, untechnical style, and are worthy of kind reception by the lovers of plant-lore. A large number of simple illustrations are given and the text is thoroughly indexed.

Shakespeare's Comedy of the Two Gentlemen of Verona. With preface, glossary, etc., by Israel Gollancz, M.A. 16mo, pp. 120. New York: Macmillan & Co. 45 cents.

Shakespeare's Comedy of the Merry Wives of Windsor. With preface, glossary, etc., by Israel Gollancz, M.A. 16mo, pp. 156. New York: Macmillan & Co. 45 cents.

The "Temple" edition of Shakespeare is in cozy and dainty pocket form. The text, which is that of the "Cambridge" edition, is supplemented by a preface, glossary and a few notes by Israel Gollancz. Each volume contains a suitable frontispiece, the one in the "Merry Wives of Windsor" being the Chandos portrait of Shakespeare, after the engraving of J. Cochrane.

FICTION.

In Varying Moods. By Beatrice Harraden. American Copyright Edition. 16mo, pp. 294. New York: G. P. Putnam's Sons. \$1.

MISS BEATRICE HARRADEN.

The sudden and extended popularity which has recently crowned the success of "Ships that Pass in the Night" guarantees a public that will await with eagerness any production from Beatrice Harraden's pen. It might be hard to specify with accuracy the qualities which differentiate the short chapters of "In Varying Moods" from a thousand other chapters that escape notice in current literature. It is plain that we are interested in the people themselves—in these men and women who so often have sorrow as the close companion of life, who struggle on, suffering and perhaps in their own estimation failing, who touch us because they are real human beings. It evidences noble power in the fiction writer when his work interests us in character and mental habit rather than in events, adventurous or other. Miss Harraden's plot in "Ships that Pass in the Night" was slight and it might have

been still more slight without injuring the real meaning of the story. In "A Bird of Passage," one of the short sketches of the new volume, the author shows herself capable of presenting a "situation" (but even that, to be sure, is something different from an *event*); and in the same chapter proves herself appreciative of the humorous side of life. The other episodes of the collection are all serious and essentially moral in their bearing. They are more than serious; they have something of the same flavor of the pathetic which penetrates "Ships that Pass in the Night." The manner in which Miss Harraden dwells upon the uncertainties and disappointments of existence, the human helplessness beneath the hand of fate, recalls to some extent "The Story of an African Farm" and passages in "Dreams." "At the Green Dragon," "The Painter and His Picture," "The Clockmaker and His Wife," "An Idyl of London" and the allegorical sketch "Sorrow and Joy," which complete the contents of "In Varying Moods," are all sad with the calm sadness of resignation. If one was inclined to ask the author why she does not place a more happy lot of people in her pages, she might very possibly answer, "I give you people whom I have seen with the bodily eye or with the eye of imagination, and I also ask you how under the conditions in which you see them they could be genuine men and women and be particularly cheerful." At least the various individuals into whose inner history Miss Harraden gives us a glimpse—farmer's daughter, author, artist, or clockmaker, as the case may be—have had an experience. Each can say "Vixi," and any one who can say that has something which appeals to the rest of us. "In Varying Moods" will not pass into literary annals as a great book or as opening an epoch, but it is on nearly all counts worth reading and it is being read.

Kerrigan's Quality. By Jane Barlow. 12mo, pp. 216. New York: Dodd, Mead & Co. \$1.25.

Jane Barlow, whose delightful "Irish Idylls" have already reached a sixth edition, follows the leadership of many a short story writer in attempting a full-fledged novel. While "Kerrigan's Quality" may not be a piece of fiction of the very highest achievement, it is a story of great interest and of undoubted success. The people of "Quality" to whom the authoress introduces us are well enough in their way, but they are after all but the pivots about which revolve the essential interests of the novel. Kerrigan himself is a character of marked and attractive individuality, being an Irish bachelor approaching forty, who has returned to his native shores after an extended absence in Australia, made suddenly wealthy by the will of an uncle. Yet probably the highest value of the story as a work of art remains of the same kind as that in Irish Idylls: the sayings and doings of the minor personages in the aggregate give us an intimate and accurate insight into the life of a very poor little Irish village, exceedingly provincial, and so close to the sea that the very potato fields are frequently injured by the Atlantic. This life is thrown into relief by contrast with the wider experience of the traveled Kerrigan and with the family of rank which passes in local gossip under the appellation of "Kerrigan's Quality," because it occupies for some time the "Big House" which the ex-Australian had bought. The tragic drowning of a young lady belonging to this family gives a sombre coloring to the later pages of the story. This village life is monotonous, terribly so, but it is deeply human, and when it passes into fiction under the care of an artist it becomes as interesting as the life of the aristocratic or any exceptional class of society.

A Journey in Other Worlds: A Romance of the Future.

By John Jacob Astor. 12mo, pp. 476. New York: D. Appleton & Co. \$1.50.

One of the books upon which large public attention has been centered during the past few weeks is Mr. John Jacob Astor's "Journey in Other Worlds." It is a series of speculations, with the slightest thread of a story interwoven, of the state of human society, especially of its material, scientific achievement, in the year 2000, together with a vision of the wonders of Jupiter and Saturn. This latter planet, reached as the other by a party of explorers from the earth (who utilize a force called *apergy*, which opposes gravitation and gives new meaning to "shuffle off this mortal coil") is found to be the abode of departed spirits. Upon Saturn, Mr. Astor's imagination revels in a mystical view of the inner spiritual meaning of our existence, as in Jupiter and on the earth it dreams of material advancement. The author finds opportunity to mention some of the latest discoveries and theories of astronomy, and in general he works out the life of the future with such detail as to give the sense of reality. This book with its serious imaginings of the "Looking Backward" type and its mystical speculation with a bit of flavor of theosophy and with its bold and picturesque portrayal of yet-to-be-invented inventions and yet-to-be-visited worlds, which recalls very strongly the style of Jules Verne, is a fascinating work. The nine full-page illustrations by Dan Beard are a helpful stimulus to the reader's imagination.

Lay Down Your Arms: The Autobiography of Martha von Tilling. By Bertha von Suttner. Authorized

translation. 12mo, pp. 447. New York: Longmans, Green & Co. 75 cents.

Mr. Holmes, the translator of this volume, undertook his task at the request of a Committee of the International Arbitration and Peace Association. His version, which has been revised by the authoress, now appears in a second edition. Aside from the interest of the work as a piece of fiction, its bearing upon the problem of war and the present military conditions of the great European States has given the book a large circulation. The translator believes that it will do much to form an intelligent public demand for arbitration as a substitute for war among civilized nations in the near future.

The Man in Black. By Stanley J. Weyman. 12mo, pp. 212. New York: Cassell Publishing Company. \$1.

As in previously noticed works, Mr. Weyman's "Man in Black" carries us back to the stirring times of Richelieu, but

MR. STANLEY J. WEYMAN.

the great cardinal is not the hero of the story. That part is played by a brave though naturally timid little chap who goes through a number of exciting adventures, which reach a happy conclusion before we read "the end." The old Paris astrologer is also an interesting figure. Mr. Weyman's vigorous, direct style, which tells the story well and attempts nothing else, offers a refreshing change from the analytic novelists of the day. There is little psychology in his form of historical romance, but there is nothing dull, and lovers of a story of adventure, whether young or old, are indebted to his pen. The "Man in Black" is well illustrated by Wal Paget and H. M. Paget.

Hypnotic Tales and Other Tales. By James L. Ford. Paper, 12mo, pp. 220. New York: George H. Richmond & Co. 50 cents.

George H. Richmond & Co. have ventured to throw upon the market a new edition of Mr. Ford's funny *Puck* prose sketches, with illustrations by the *Puck* artists. Mr. Ford's humor rings true and conveys considerable gentle satire on phases of New York City life, on traditional New England characters, etc. One laughs heartily at these bits of extravagant fun poking, but he sees nearly always a point worth noting.

My Two Wives. By One of Their Husbands. The "Unknown" Library. 16mo, pp. 196. New York: Cassell Publishing Co. 50 cents.

In these pages Mr. "Timothy Moleskin," who is supposedly a London grocer in the neighborhood of forty years of age, relates some of the interesting and varied experiences of his married life. Suffice it to say that the account is amusing

throughout and just the thing to make some dull summer hour pass pleasantly. With the first Mrs. Moleskin the hero does not enjoy any considerable amount of happiness, but his second choice is a much more fortunate one, and the touch of pathos upon the last page is of that pleasant quality which belongs to a new and rejoicing parent.

A Modern Wizard. By Rodrigues Ottolengui. 12mo, pp. 434. New York: G. P. Putnam's Sons. \$1.

A series of stories of the "detective class" has rapidly come from Mr. Ottolengui's pen. "A Modern Wizard" has many of the elements of the wildest romance, but the author's analytical and objective method gives the reader a certain sense of reality. In part the story is the record of a strange murder case in New York; it deals with some of the tragic possibilities of hypnotic power, has a lively movement and is worthy to take a high place among the novels of its class.

The Lone House. By Amelia E. Barr. 12mo, pp. 235. New York: Dodd, Mead & Co. \$1.25.

Found Guilty. By Frank Barrett. 12mo, pp. 339. New York: Lovell, Coryell & Co. \$1.

How Like a Woman. By Florence Marryat. 12mo, pp. 324. New York: Lovell, Coryell & Co. \$1.

Mr. Bailey-Martin. By Percy White. 12mo, pp. 318. New York: Lovell, Coryell & Co. \$1.

The Damascus Road. By Léon de Tinseau. Paper, 12mo, pp. 344. New York: George H. Richmond & Co. 50 cents.

Out of Bohemia: A Story of Paris Student Life. By Gertrude Christian Fosdick. 16mo, pp. 236. New York: George H. Richmond & Co.

Broken Links. A Love Story. By Mrs. Alexander. 12mo, pp. 327. New York: Cassell Publishing Company. \$1.

'96: A Romance of Utopia. By Frank Rosewater. Paper, 12mo, pp. 268. Omaha: The Utopia Company. 50 cents.

A Modern Buccaneer. By Rolf Bolderwood. 12mo, pp. 344. New York: Macmillan & Co. \$1.25.

POETRY.

Selections from the Writings of Edward Randall Knowles, LL.D. 12mo, pp. 43. Boston: J. Stillman Smith & Co.

Doctor Edward Randall Knowles, one of the most eminent among the orthodox Catholics of this country, whose name has been prominent in public notice within the past few months, is a poet and a prose writer of power. In the very small but handsomely appearing volume of selections from his writings we are enabled to catch something of the spirit of his religious belief. There are included poems of spiritual aspiration and faith, several Latin hymns, a few secular verses, and in prose an essay upon "The True Christian Science," and a philosophic-religious chapter upon "The Supremacy of the Spiritual." Doctor Knowles is yet a man not much beyond thirty, and many believe him to be the rising poet of Catholicism in America.

A Song of Companies, and Other Poems. By Orrin Cedestman Stevens. 12mo, pp. 110. Holyoke, Mass.: H. C. Cady Printing Co. 50 cents.

"Companies of Children," "Companies of Friends," "Companies of Singers," "Companies of Fighters," are among the groups to which Mr. Stevens pays poetical homage. The author is a moralizer and has an extreme fondness for personification of abstract qualities. Some of the shorter poems, including a number of sonnets, in the later pages of the volume are simpler and more poetic than the longer poems. Some are of excellent meaning and expression.

Sea Rhymes. By Ernest Wright. Paper, 12mo, pp. 192. New York: Published by the Author, 201 East Twelfth street. 50 cents.

Mr. Wright is not a poet and his verses have no claim to be judged as art, but he has an old sailor's hearty appetite for story telling, and he has written out, with passable, sometimes even excellent, metrical effect three genuine yarns of a tar.

There is a certain ruggedness and honest frankness in these rhymes which offer a refreshing refuge to a reader tired of Swinburnian sentiment or the over-finish of modern verse. Mr. Wright's little book, which he has ventured to publish himself, is a curiosity in current literature. It is not without its human interest also, and its three complete stories have enough of adventure and of the spirit of the sea to make them an agreeable recreation.

A Few Poems on Hawaii, China and America. By Varnum D. Collins. Paper, 12mo, pp. 86. Washington: Published by the Author.

The first portion of this booklet records in rhymed octosyllabic verse an outline of the history of Hawaii, which the author has twice visited. The majority of the poems are paraphrases from ancient classical Chinese odes, and are not without a certain interest, though they cannot be called artistic. The author tells us that he "has spent nearly twenty years in China, mingled much among her people, and been a diligent student of her literature and life."

EDUCATION AND TEXT-BOOKS.

The Principles and Practice of Teaching and Class Management. By Joseph Landon, F.G.S. 12mo, pp. 478. New York: Macmillan & Co. \$1.60.

Mr. Landon is an English educator who has had a large experience in teaching and has been for nearly twenty-five years a lecturer upon the subject of school management, in a training college. His work is a systematic and elaborate treatise, from the artistic rather than the scientific standpoint, intended to be of practical service to students of method and child education in the schools generally. A careful arrangement and the use of several sizes of type, together with a very complete index and some blank pages for notes, render the volume of greater worth as a text-book. Among Mr. Landon's chapters are those upon "General View of Oral Teaching," "Typical Methods of Procedure," "Notes of Lessons," "The Teaching Devices," and class management. After going over the ground suggested by these titles, he considers separately the principles involved in the teaching of "reading," "spelling and dictation," "writing," "arithmetic," "drawing," "geography," "English," and "elementary science." The work seems to be an important one in its field, and it is undoubtedly worthy of careful examination by the school-teacher and the teacher of school-teachers.

Mathematics for Common Schools. By John H. Walsh. In three parts. Part I, Elementary Arithmetic; Part II, Intermediate Arithmetic; Part III, Higher Arithmetic. 12mo, pp. 212-458-803. Boston: D. C. Heath & Co. 40, 40 and 75 cents.

Mr. John H. Walsh, Associate Superintendent of Public Instruction at Brooklyn, has prepared an arithmetic for common schools, covering the work from the elements to a completion of a grammar school course. It is published in three volumes. The author mentions as the special features of his work its "division of the arithmetical portion into half yearly chapters instead of the ordinary arrangement by topics; the omission, as far as possible, of rules and definitions; the very great number and variety of the examples; the use of the equation in the solution of arithmetical problems . . . and the introduction of the elements of algebra and geometry."

The School Room Guide to Methods of Teaching and School Management. By E. V. DeGraff, A.M. Paper, 12mo, pp. 396. Syracuse: C. W. Bardeen. 50 cents.

In preparing this one hundred and eleventh edition of DeGraff's "Guide," the publisher rearranged the original text where it seemed wise, and has furnished entirely new chapters upon drawing, penmanship and geography of North America, by competent educators. Mr. Bardeen gives place to the volume as Number Seven of his "Standard Teachers' Library."

Meisterwerke des Mittelalters. Von Carla Wenkebach. 12mo, pp. 298. Boston: Ginn & Co. \$1.30.

Professor Wenkebach's work is somewhat out of the line of usual text-books in German. It contains selections translated into modern German from the great mediæval Teutonic epics—*Parzival*, the *Niebelungenlied*, "*Tristan und Isolde*," etc., and from the prose works of Luther, Hans Sachs, from "*Das Volksbuch von Dr. Faust*," etc. A considerable number of notes (in modern German) are added. The ordinary reader as well as the student may find these pages a pleasant introduction to German literature in the middle ages and an outline of its greatest achievements.

Schiller's *Maria Stuart*. Edited, with notes, by Lewis A. Rhoades. Ph.D. 12mo, pp. 256. Boston: D. C. Heath & Co. 65 cents.

Mr. Rhoades is upon the staff of the German department of Cornell University. He has furnished some thirty pages of notes to the text of *Maria Stuart*, and in the introduction has aimed to help the student to an appreciation of the drama as a piece of literary art.

Short Selections for Translating English into French. Arranged by Paul Bercy. 12mo, pp. 137. New York: William R. Jenkins. 75 cents.

The English selections of this little book are arranged progressively and are furnished with explanatory and grammatical notes. In themselves they are interesting, frequently anecdotal in nature or extracted from well-known literature. A few college examination papers in French are added.

Chronique du Règne de Charles IX. Par Prosper Mérimée. Edited, with notes, by P. Desages. Paper, 12mo, pp. 120. Boston: D. C. Heath & Co. 25 cents.

An adaptation for school use of one of the earliest works of Mérimée (1829). There are nearly twenty pages of notes.

L'Oro e l'Orpello. A Comedy in two Acts. By T. Gherardi del Testa. Paper, 12mo, pp. 68. Boston: D. C. Heath & Co. 25 cents.

Mr. Thurber, of Cornell University, has prepared and annotated this Italian text in the belief that it is adapted for early reading.

Agricultural Analysis: A Manual of Quantitative Analysis for Students of Agriculture. By Frank T. Addyman, B.Sc. 12mo, pp. 200. New York: Longmans, Green & Co. \$1.75.

Practical Agricultural Chemistry for Elementary Students. By J. Bernard Coleman and Frank T. Addyman. 12mo, pp. 96. New York: Longmans, Green & Co. 50 cents.

These volumes are the work of English teachers in the field of agricultural chemistry and they are intended to be of service as text-books in that subject. Space is given to the description of necessary apparatus, and the arrangement of the text, which is furnished with sufficient illustration, is simple and logical.

The Questions and Answers in Drawing Given at the Uniform Examinations of the State of New York Since June, 1892. Paper, 12mo, pp. 75. Syracuse: C. W. Bardeen. 25 cents.

EXPLORATION, SCIENCE AND TECHNOLOGY.

Headwaters of the Mississippi. By Captain Willard Glazier. 12mo, pp. 527. Chicago: Rand, McNally & Co. \$2.50, \$3, \$4.

In 1881 Captain Willard Glazier, dissatisfied with the state of knowledge as to the headwaters of our great river, organized an expedition for the purpose of further discovery. The geographical world was soon notified of results, and for the past thirteen years a more or less vigorous contest has been waged over the true value of Captain Glazier's achievement. In his own words, the expedition of 1881 and a second one in 1891 convinced him that "there is a beautiful lake above and beyond Itasca wider and deeper than that lake, with woodland shores, with five constantly flowing streams for its feeders and in every way worthy of the position it occupies as the Primal Reservoir or True Source of the Father of Waters." Mr. Glazier prefixes to an interesting narrative account of these expeditions a view of the chief Mississippi River explorers from De Vaca, early in the sixteenth century, to Lanman in 1846. This summary occupies nearly one-half of the book. Mr. Pearce Giles, a member of the expedition of 1891, has written an extended appendix which gives his own view of the question and a formidable array of journalistic, scientific and governmental opinion on both sides of the case. A map of Lake Glazier and its feeders is given and a large number of full-page illustrations having some connection with the subject of the work. The student of Mississippi geography will find much of interest in these narratives and discussions.

Aerial Navigation. By J. G. W. Fijnje van Salverda. 12mo, pp. 269. New York: D. Appleton & Co.

This work of Mr. Fijnje has been translated from the Dutch by George E. Waring, Jr., the northern assistant administrator of Public Works of the Netherlands. To the original essay have been added extracts from Lavoisier's "Experiments in Aerodynamics" and "The Internal Work of the Wind," and from Holland's "Mechanical Flight." The book gives a short summary, largely in popular form, but of strictly scientific basis, of the development of aerial navigation from Montgolfier's balloon (1783) down to 1896. It can scarcely fail to be of interest to any thinking man, and one reads with a quickened pulse the opinion of capable and careful investigators that the era of successful air flights is very probable in the near future. The solution of the problem would, of course, or we may hopefully say will, to quote the closing words of Mr. Fijnje's essay, "exert a powerful influence on social conditions, of which we can now form no adequate idea." A number of illustrations of air ships add interest to the book.

Electrical Measurements for Amateurs. By Edward Trevert. 16mo, pp. 117. Lynn, Mass.: Bubier Publishing Co. \$1.

Mr. Trevert writes with the purpose of clearing up some of the difficulties connected with the measurement of electricity on the part of those "who are working on a small scale, and who have not been in a position to acquire a practical familiarity with the subject." His text is direct and simple and is explained by a number of illustrations.

How to Make and Use the Telephone. By George H. Cary, A.M. 16mo, pp. 117. Lynn, Mass.: Bubier Publishing Co. \$1.

Mr. Cary states that he has had many years of practical experience in telephone matters. He has prepared his small manual for the sake of giving useful information upon the points most important to the non-professional user of the telephone. A chapter upon "How to Make the Phonograph" is included, and a number of plain illustrations are given.

A System of Lucid Shorthand. Devised by William George Spencer, with a Prefatory Note by Herbert Spencer. 12mo, pp. 28. New York: D. Appleton & Co.

Herbert Spencer's father occupied himself for a decade or more in devising a system of shorthand, and the manuscript was ready for the press in 1843, but the matter of publication was never arranged during the life of the inventor. Now after fifty years the philosopher presents the scheme to the public, acting upon the conviction, "long since formed and still unshaken, that the lucid shorthand ought to replace ordinary writing."

MISCELLANEOUS.

Steps into Journalism. Helps and Hints for Young Writers. By Edwin Llewellyn Shuman. 12mo, pp. 239. Evanston, Ill.: Correspondence School of Journalism. \$1.25.

Mr. Shuman's preface tells us that he has had newspaper experience upon Chicago journals in all the various capacities from printer's devil to editorial writer. His pages are directed mainly to aspirants in the journalist's profession, and, throwing aside the veil of conventional idealism, they picture a field which might prove uninviting to all but the few who are chosen. There are not as yet too many books which show the actual workings of the modern daily journal, and Mr. Shuman's, while written in a very practical and unliterary way, is bright and entertaining, and to some considerable extent informational. A person preparing for newspaper work as reporter or correspondent may find it very helpful.

The Amateur Aquarist: How to Equip and Maintain a Self-Sustaining Aquarium. By Mark Samuel. 12mo, pp. 124. New York: The Baker & Taylor Company. \$1.

Mr. Samuel, who is aquarist to Columbia College, has brought together a number of practical suggestions regarding the preparation and maintenance of a "self-sustaining" aquarium. His directions are plain and to the point, and a goodly number of illustrations accompany the text.

The Gem Encyclopedia. A Compendium of Ready Reference. 32mo, pp. 48. Chicago: Laird & Lee. 50 cents.

A great deal of curious matter and much that is of use for serious reference is crowded into the closely-printed pages. Anecdotal and chronological tables are frequent.

CONTENTS OF REVIEWS AND MAGAZINES.

The REVIEW OF REVIEWS is, in the best sense, an illustrated history of the times, and as such is pre-eminently worthy of preservation in well-bound volumes.

Complete unbound volumes delivered to us, postage or express prepaid, and in good condition, with covers on, will be bound and returned, charges prepaid by us, for 75 cents a volume. Back numbers, for filling out volumes can be supplied as far back as April, 1892. For this specific purpose we charge 20 cents a number.
